Dependability. This refers to the probability of expected performance and freedom from breakdown under normal conditions within a certain time. The elements of dependability include: Breakdown frequency (number of breakdowns per unit time), duration of sustained breakdown, average life, durability, effectiveness and other factors. Quantitative analysis is as difficult for dependability as it is for progressiveness. However, this element is of great significance to the value of the project. If a research or innovation project is technically advanced with great economic benefits but undependable in the course of production, it cannot be easily popularized or may even be written off as a total failure. In studying the dependability of a research project, the dependability coefficient may be expressed by Kl. Thus Kl = K_1, K_2, K_3, K_4, K_5, and their numerical values can be obtained from Table 2.

Suitability. This concerns whether the result of research can promote the technology of production and be popularized or whether it is suitable for marketing. Promotion means the ability to lead or speed up the development of production or the progress of technology in other departments and the possibility of its causing a chain reaction. Popularization means the widespread use of the project in the production within a short time even by other trades and professions. Marketing refers to the degree of competitiveness in the market. All these factors come under the category of suitability, and its coefficient can be expressed by Kd. Thus Kd = K_1, K_2, K_3 and their numerical values can be obtained from Table 3.

Job opportunity. This means a comparison of the labor power required for the research project with that required by similar equipment or measures so as to determine whether labor will be reduced or increased. This consideration is necessary in view of our present large population and the difficulty of job placement. If, in such circumstances, we one-sidedly strive for high automation and high labor productivity to the extent of jeopardizing job opportunities, a social problem will arise. Of course, this element should be combined with economic benefits, progressiveness, feasibility, dependability and suitability for a comprehensive analysis. For practical purposes, the job opportunity coefficient can be expressed as Ke, and the "abundance, equivalent and scarcity" are expressed as Ke = 0.9; 1.0; 1.1.

In applied value engineering, two points should be clarified:

1. In conducting analysis of technical and economic forecasts,

(1) Job opportunity coefficient Ke should be in direct proportion to value engineering V when we consider the job opportunity angle. Thus,

$$V = Ka.Kv.Kl.Kd.Ke$$

(2) Job opportunity coefficient Ke should be in inverse proportion to value engineering V when we consider raising labor productivity. Thus,

$$V = E.\frac{Ka.Kv.Kl.Kd}{Ke}$$

(3) Both (1) and (2) have to be considered when there is no way to check the economic benefits. Thus,

$$V = \frac{Ka.Kv.Kl.Kd}{Ke}$$

or V = Ka, Kv, Kl, Kd, Ke.

V > 1 means acceptable and V < means unacceptable.

In evaluating or comparing the results of research, we should first compare them with projects of the same character before those of different characters.

In carrying out value engineering, we should throughout the entire process of practical application conduct follow-ups, exercise supervision and take detailed notes to insure the success of the research. Upon the completion of the research, we again have to check the result against the forecast and evaluation so as to prove its superiority or defects, and draw lessons from our experience for future guidance.

Since quantitative analysis is much more difficult than qualitative analysis in development study, particularly in the selection of numerical values for certain coefficients, we can therefore only advance through probing in practice in order that our work can be gradually improved or rationalized. However, technical and economic analyses of research projects are indispensable, and the broad masses of scientific workers are expected to carry out further probing. It is hoped that this article will provoke some effective action. (Examples omitted)

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

'JINGJI GUANLI' ON IMPLEMENTATION OF READJUSTMENT

HK030306 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 7, 15 Jul 81 pp 8-10

[Article by Shen Yue [3088 6390]: "Sort Out 'Leftist' Thinking, Correctly Implement the Policy of Readjustment"--slantlines denote boldface]

[Text] In order to understand and implement the policy of further economic readjustment in an all-round way, it is necessary to sort out the "leftist" erroneous thinking. Since the founding of the PRC, the "leftist" erroneous thinking in economic work has existed for a long time and it reached a climax during the "cultural revolution." The "leftist" mistakes in the guidelines of economic work were expressed chiefly in the deviation from China's national condition, being overanxious for successes instead of doing things within the limits of our own resources, blindly seeking excessively high targets, high speed and high accumulation.

As a result, the national economy became seriously out of proportion. Comrade Chen Yun pointed out that, in disregard of the objective conditions and going against the objective laws, some people took fantasy as truth and acted according to subjective will and tired to do things which may not be possible in the future. This remark has pointed out the crucial point of the question. The "leftist" erroneous thinking was also manifested in not proceeding from the socialist objective laws, not reorganizing the objective existence of the commodity economy in the historical stage of socialism, denying the necessity of the production and exchange of commodities, denying the historical role of the long-term coexistence of various sectors of the economy, denying that enterprises are the producers of social commodities and denying the relative independence of the activities of socialist enterprises. In the management system, excessive emphasis was placed on centralization, and enterprises were put under excessively rigid control. The "leftist" erroneous thinking was fully manifested by subordinating the driving role of science, technology and culture to production and subordinating the training of qualified personnel and the exploitation of intellectual resource, which resulted in that the role of the intellectuals not being brought into full play for a long time. Furthermore, in the matter of distribution, the practices of egalitarianism and eating "from the same big pot" were exercised, and the principle of "from each according to his ability, to each according to his work" was violated. All these practices serously harmed us in the past and their influences have not yet been eradicated. Therefore, only when we sort out in earnest the influence of "leftist" thinking, can we correctly implement the policy of readjustment and act according to socialist objective laws. To sort out "leftist" erroneous thinking is chiefly to correct the guiding thinking of the leadership and help the leadership at all levels draw lessons in the respect, not for the leadership at each level to make self-criticism and not for everyone to go through the ordeal of self-criticism.

Through practice in the past, we found that to correctly implement the policy of readjustment, it was necessary to handle well the following five relationships on the basis of sorting out "leftist" thinking.

/First, it is necessary to handle well the relationship between readjustment and production and simultaenously grasp production and readjustment./ We have undergone a process of gradual deepening in understanding the readjustment. That is, in the past 2 or 3 years, the main targets of readjustment were to curtail the scope of capital construction, reduce financial expenditure, try hard to withdraw money from circulation, achieve a financial balance and stabilize the economy. All these endeavors were undoubtedly correct. However, as pointed out by the leading comrades of the CCP Central Committee, from a long-term and fundamental point of view, the readjustment of the economy involves three things: They are the readjustment of the economic structure and the readjustment of the industrial structure. The general aim of readjustment is to gradually rationalize China's economic structure and therefore this will take a long time, as expected. But, seen from another side, if we do not summon up our energies and try our utmost to grasp well the current production and open up new sources of production, the readjustment can hardly be carried out smoothly. So economic readjustment and the current production interact and are mutually dependent. Take coal mines for one example. In January and February this year, some coal mines slackened their production and adopted a passive approach, thus resulting not only in the shortfall in the output of coal but also in the failure to fulfill the plan for stripping and tunnelling; therefore, the readjustment cannot be carried out in an isolated and static way. Spontaneous and close attention should be paid to production and readjustment. Here lies a problem of cognition. That is, at the beginning of this year, some comrades took a passive approach toward the readjustment. It seemed that so long as the readjustment was carried out, the current production could be slackened, and some people even mistakenly held that the lower the production targets, the better, or they passively waited to be closed, suspended, merged or shifted (to other types of production). All these tendencies are wrong. The Liaoning Provincial Party Committee twice convened telephone meetings thus corrected these tendencies in good time. The situation took a favorable turn in the last 10 day period of February this year, and the downward trend of production was basically reversed. We must manage to grasp production and readjustment simultaneously and help production and readjustment promote each other.

/Second, it is necessary to handle well the relationship between readjustment and reform./ Reform should be subordinated to readjustment, but the CCP Central Committee never intended that with readjustment, reform could be neglected. The orientation of reform must be upheld from start to finish. It is true that the pace of reform in some fields should be slowed down and stabilized, such as the reform of the price system and that of the wage system, but there must be reforms that are conducive to readjustment and promote readjustment. Such reforms should be carried out in a planned and active way. The experiment of expanding the decisionmaking power of enterprises, the reform of industry and the integration of enterprises are both readjustment and reform. They should be grasped firmly and developed well, and on the basis of the achievements made last year, they should be further consolidated, developed and improved. Last year, there were 262 units participating in the experimental work of expanding the decisionmaking power of enterprise business management in Liaoning Province. The output value of these units constituted 56 percent of the budgeted output value of industrial enterprises of the province while their profits constituted 76 percent. Last year, the output value of the pilot enterprises showed an increase of 6.4 percent while their profits increased by 9.9 percent. The profits they handed over to the higher authority increased by 8.2 percent. All these figures were higher than those of the enterprises which had not participated in the experiment. These pilot enterprises enabled the state to have an additional income of 290 million yuan, constituting 78.6 percent of the state's increased income. The enterprises and the individuals had an additional income of 80 million yuan, constituting 21.4 percent of the increased income, thus "more income for the state, the enterprises and the individuals" was realized, with the state receiving an exceptional increase in income. Practice has proved that the expansion of the decisionmaking power of enterprise business management is correct in its orientation with remarkable achievements and sound development being realized.

Since the 3d Plenary Session of the 11th CCP Central Committee, particularly since the CCP Central Committee put forth the principle of "giving fuller play to strong points, protecting competition and promoting integration," increasingly remarkable economic effects were achieved in the reform of industry and the integration of enterprises within the province. A total of 122 industrial companies, 65 general factories, 439 economic complexes and 3,051 amalgamated enterprises have been established throughout the province with a work force of 1 million staff members and workers, and annual output value of 11 billion yuan and 1.3 billion yuan of profits. The number of the staff and workers, output value and profits of the organized enterprises accounted for one-fourth of all the province's industry.

Some comrades mistakenly held that with the mention of readjustment, they should disregard reform and take a passive approach toward it. This is wrong. In fact, the readjustment and reform are mutually complementary. We should never take the road back because something goes wrong with reform. It has been discovered the little decisionmaking power the enterprises got during the experiment has not received its deserved respect and has even been taken back by the authority above. This seriously dampened the enthusiasm of the pilot enterprises and their staff members and workers. Economic reform is a new thing. We must cherish it and support it. All economic sectors such as finance, banking, tax, goods and materials, labor, commerce and foreign trade should vigorously cooperate with one another, make close concerted efforts and maintain the continuity and stability of the policies to smoothly carry out the readjustment and reform and thus, enliven the economy.

/Third, it is necessary to handle well the relationship between centralization and the revitalization of the economy./ During the further readjustment of the national economy, the macroeconomy must adhere to centralization but efforts should be continued to revitalize the microeconomic sectors mainly to revitalize production. Over the past 2 years, good experience has been gained in making the economy more active. For instance, under the guidance of state planning, regulation by market mechanism was exercised, market forecasts were carried out, and the enterprises were allowed to organize and increase production according to the contracts signed by the production side and the users' side on the condition of arranging production strictly according to the state plan; the principle of to each according to his work was further implemented and the work of handing out rewards was also strengthened; the marketing of a part of the products by the enterprises through their own channels was permitted and direct contacts between the production side and the user's side was encouraged. It wasn't only the breakthroughs in all these respects that enlivened industry. Last year, the total value of industrial output of Liaoning Province registered 9.4 percent increase over 1979. But at the beginning of this year, an increase of 3 to 4 percent was unlikely to be attained. However, there later occurred an increase in production. The main reasons are seen to be the following three points: First last year, in the industrial production of the province, regulation by market mechanism was carried out under the guidance of state planning, and the products put under regulation by market mechanism were about 30 to 40 percent. Second, the economy and production were revitalized. This included the expansion of the decisionmaking power of enterprises, the reform of industry, the promotion of integration, and flexible adaptation in implementing policies on the condition that they not violate the principles and policies of unity. Third, the investment effects were brought into full play by relying on tapping potential, innovating and transforming the existing enterprises. Last year, the increase in the output value achieved by tapping potential, innovating and transforming the existing enterprises constituted around 30 percent of the total increase. Practice has shown that the principles put forth by the Liaoning Provincial Party Committee were correct. That is, the principle of "stressing five things, and improving one" (stressing that some of the communes, the production brigades, the production teams and individuals in the rural areas should be allowed to get rich first; stressing the revitalization of the economy; stressing the management of all trades and professions, stressing science; stressing the training of qualified personnel; and improving leadership skills). Under the guidance of state planning, the role of regulation by market mechanism was brought into play to carry out the principle of "breaking four things" (breaking conservative thinking; breaking the separation in length and breadth by regulations and different regions, departments and trades; breaking the superfluous interlinks; and breaking the irrational old-fashioned regulations and restrictions), and the principle of "one adaptation" (flexible adaptation on the basis of not violating the policies and principles). Therefore, the effective methods and measures which promoted production and improved the economic effect in the past should be upheld continuously and improved consistently. At the same time, full play should be given to the overall planned and coordinated role of the various localities so as to proceed from the local actual conditions, formulate the related specific policies and solve the problems of economic work in time.

/Fourth, it is necessary to handle well the relationship between the part and the whole, the immediate and the long-term./ It is imperative to break the bounds of different regions and trades and the "small but comprehensive" and "large and comprehensive" practices. It is not permitted for various localities to form a separate industrial complex. Take the "three big industrial items" (wristwatches, bicycles and sewing machines) for instance. The state is drawing up an overall plan for producing the "three big industrial items." The province is also making an investigation and working out a plan for this purpose. Practice has proved that it is not profitable to produce bicycles in smaller batches than 300,000 bicycles. Everyone vies with each other in producing the "three big industrial items" but eventually no one will succeed owing to their lack of competitive strength. At present, there are 35 factories producing washing machines in Liaoning Province. In fact, three of four primary motor manufacturing factories would be enough and the other key parts and spare parts can be produced and organized to form a complete set within the province. Only when the level of specialized production is improved, can the targets of high quality, low production costs and large batches be met. Therefore, we have decided to rationalize the layout and fix the locations. Repeated and duplicated construction is no longer allowed. This requires us to earnestly do a good job of market forecasting, have a clear understanding of the needs of the people in a certain period (for instance the needs before 1985), make feasibility studies and technical deliberations on every plan, prevent blindness and avoid rushing headlong into mass action in an unplanned way. One must not be concerned only with the immediate and neglect the long-term, nor only with the part at the expense of the whole. One must take into account both past experience and the situation that may possibly arise in the future and develop an overall plan. The Provincial Party Committee has decided to make industrial cities the center for production and arrange other product industries around it and break the bounds of different departments and regions, organize the enterprises in a rational way step by step, and further make a proper job of the reform of industry and the integration of enterprises.

/Fifth, it is necessary to handle well the relationship between readjustment, restructuring, consolidation and improvement./ The eight-character policy of "readjustment, restructuring, consolidation and improvement" is a unified entirety, and it must be carried out comprehensively. Readjustment is the core, and without readjustment. the national economy cannot regain the initiative. Consolidation is the foundation. Without consolidating the existing enterprises, readjustment and restructuring will lack a firm foothold and the results of readjustment cannot be furhter strengthened. Take coal mines for instance. The tunnels of some coal mine were in serious disrepair and the rate of this disrepair of some tunnels reached 30 percent. Through readjustment, the problem of the tunnels being in disrepair was solved. But without consolidating the coal mines, setting up and perfecting various management systems, including various responsiblity systems and strengthening enterprise management, the tunnels will fall into disrepair as before, after a period of time. So it is imperative to grasp firmly the consolidation of enterprises.

Over the past few years, some achievements were made in consolidating the enterprises of Liaoning Province. Of 3,056 industrial and transport enterprises at or above the municipal level throughout the province, 2,783 enterprises had reached acceptable standards, constituting 91 percent of the enterprises. According to incomplete statistics, in the province there are 840 enterprises which exercised all-round quality management, nearly 1,000 enterprises which carried out all-round business accounting and a number of enterprises which carried out the rotational training work for their staff members and workers. The production of most of the enterprises has recovered and exceeded the previous best records. However, looking at the economic effects of the industrial and transport enterprises as a whole, quite a few targets have not reached record levels. Compared with Shanghai and other advanced localities and units, we still have a long way to go. Therefore, this year, taking the improvement of economic effects as the key point, we must learn from and catch up with Shanghai and further grasp well the rectification of enterprises and business management.

The present situation is good, but the implementation of the policy of readjustment is only the beginning. On the road of advancement, there are still various difficulties confronting us. For this reason, we are determined to analyze new situations and solve new problems in a conscientious and down-to-earth manner to ensure the smooth advance of the work of economic readjustment and strive for the all-round fulfillment of the state plans.

CSO: 4006/480

'JINGJI GUANLI' ON EXPERIMENT IN PROFITS, LOSSES

HK050744 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 7, 15 Jul 81 pp 42-45, 10

[Article by Gu Zongcheng [7357 1350 2763] and Sun Guanglin [1327 1684 2651] of the Economics Research Office of the Sichuan Institute of Social Sciences: "A Preliminary Study of the Characteristics of the Assumption of Sole Responsibility for Profits and Losses by the Enterprises Under the Socialist Ownership by the Whole People"]

[Text] With the development of the expansion of the enterprises' decisionmaking power, some enterprises in our country have been experimenting with independent accounting, paying taxes to the state instead of turning profits over to it, and assuming sole responsibility for their own profits and losses. Different people have different arguments and views about these measures. Can the enterprises under the ownership of the whole people really assume sole responsibility for their profits and losses? Must they assume this kind of sole responsibility to an "absolute" degree? Is the assumption of sole responsibility for profits and losses implemented for the sake of changing the nature of the system of ownership by the whole people, or for the sake of perfecting the internal economic relations of the system of ownership by the whole people? The answers to these questions are related to both the orientation of the reform of our economic systems and the specific policies concerning the present experimentation. If we want to answer these questions correctly, it is of key importance to clearly understand the characteristics of the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people.

I

Assumption of sole responsibility for profits and losses amounts to a principle of common operation which governs the production of commodities, and which requires every producer of commodities to have the income arising from production and operations to cover the expenditures incurred, and moreover, to earn a profit. Such is the general substance and character of assumption sole responsibility for profits and losses. In the long course of economic development in human society, under different systems of ownership, various categories of producers of commodities differing in their social nature have all observed this principle of operation: assumption of sole responsibility for their own profits and losses. However, the economic relations embodied in this principle have differeed with variations in social organizations and the relationships of ownership systems, and have thus reflected the specific contents and characteristics of the assumption of sole responsibility for profits and losses.

At the present stage, our country's socialist economy is a planned commodity economy. The enterprises under the ownership by the whole people are relatively independent producers of commodities, and therefore, assumption of sole responsibility for profits and losses as a principle of operation, is equally applicable to them. However, by saying this, we have only mentioned the general character of assumption of sole responsibility, without revealing the specific contents of assumption of sole responsibility for profits and losses by the enterprises under the ownership by the whole people. Therefore, we must specifically analyze in depth the economic relations embodied in assumption of sole responsibility for profits and losses by such enterprises.

At the present stage, in our country, the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people is based on the separation of the power to own the means of production from, and also the unity of this power with, the powers to possess, use and allocate the means of production. For one thing, this kind of assumption of sole responsibility for profits and losses embodies some economic relationship between the enterprises as socialist producers of commodities; and for another thing, it embodies the economic relationship between the socialist state and the enterprises under the ownership of the whole people, namely, the separation of the power to own the means of production from, and also the unity of this power with, the powers to possess, use and allocate the means of production. The first relationship, which is a horizontal one, is embodied in basically the same manner in the assumption of sole responsibility for profits and losses by the enterprises under the two different systems of public ownership. By virtue of the latter relationship, which is a vertical one, this kind of assumption of sole responsibility for profits and losses is essentially relative and not absolute; this latter relationship embodies the internal economic relationships of the system of socialist ownership by the whole people. Above are the basic characteristics of the assumption of sole responsibility by the enterprises under the ownership by the whole people.

Because the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people is essentially relative, we are primarily required to correctly divide economic powers between the state and the enterprises. The overall requirement is that we must ensure that the enterprises will have relatively adequate decisionmaking power over their operations and management (such power being the specific form of the enterprises' powers of possession, utilization and allocation), and we must also ensure that the state has the power to own the means of production in the custody of the enterprises and will exercise unified leadership over the enterprises.

Judging from the experience of our preliminary practice, if the enterprises under the ownership by the whole people assume sole responsibility for their profits and losses, in principle, they should have the following categories of decision-making power.

1. Under the guidance of state planning, the enterprises should have the power to formulate their own plans for production according to market needs, except when limited by directive plans.

2. When the enterprises have fulfilled the tasks specified by the state with regard to its monopolistic purchase or selective purchase of products, they should have the power to allocate the remaining products. They should be allowed to make contracts with other units concerning the supply of products, to entrust the marketing of products to commercial or commodities departments, or to market the products themselves. They should also have the power to set prices for their own products according to market demand and supply and within the limits permitted by the state's policies in relation to commodity prices.

3. The enterprises should have the power to purchase the means of production by themselves according to the needs of production. They should also be empowered to dispose of, according to relevant regulations stipulated by the state, those means of production which are left unused, which embody backward technology, or which result in poor economic effect.

4. The enterprises should be empowered to retain all after-tax profits and to use them for developing production, for the staff and workers' collective welfare, for distribution bonuses and for expanding reserve funds, according to principles stipulated by the state.

5. Under the prerequisite of complying with the state's labor policies, the enterprises should be empowered to act on their own in determining the size and composition of their staff, inviting applications for jobs, recruiting workers by selecting the best qualified applicants, readjusting wages, and giving rewards or punishments to the staff and workers.

6. Within the limits of simple reproduction, the enterprises should have the sole power to allocate funds, should be allowed to utilize the depreciation funds set aside, and should enjoy decisionmaking power over reproduction that leads to the expansion of the value of material things. On this basis, the enterprises should also be permitted to raise their own funds (including after-tax profits) and to carry out, within the limits prescribed by the demands of state plans, reproduction that leads to the expansion of the value of funds.

The proposition that the enterprises should enjoy decisionmaking power over production, circulation, distribution, consumption and reproduction does not imply, in the slightest degree, that the enterprises can dispense with unified state leadership and carry out absolutely free operations. On the contrary, this proposition demands that unified state leadership over the entire national economy be ensured. The reasons are: (1) After all, the enterprises are a tiny part of the entire national economic network, and what they know about the overall situation will inevitably be limited. This limitation will develop into blindness and also become an obstacle to the proportionate development of the national economy in the absence of a social center to exercise direction and carry out readjustment. Therefore, there must be an alert and resourceful "brain" to coordinate and command them in a unified way. (2) The enterprises' independent economic interests are basically consistent with the state's interests. However, the enterprises are prone to proceed from their own interests in considering problems. This will give rise to contradictions between the enterprises' interests and the overall interests of the economy, between immediate interests and long-term interests. Therefore, the state is required to perform its functions as a regulator of interests. (3) Ours is a country with a vast territory, a large population, a backward economy, a relatively low standard of economic management, and with deep-rooted habitual forces of small producers prevailing. In view of this national condition, it is even more necessary for the state to concentrate, in a relative degree, the scattered, limited economic forces, and to undertake the "four modernizations" construction step by step, in a planned way and with emphasis on key tasks. If the state is deprived of the power to own the means of production, it will lose the power to exercise leadership over the entire national economy.

Therefore, by several means described below, the state must exercise the power of authority over the enterprises under the ownership of the whole people that assume sole responsibility for their own profits and losses. This also indicates the special nature of the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people in contrast to the assumption of sole responsibility for profits and losses by the enterprises under collective ownership.

1. The state must have the statutory power to own the means of production in the custody of the enterprises under the ownership of the whole people, and must, by virtue of this, collect taxes (or fees) from the enterprises for the possession and use of funds. The enterprises must be responsible to the state and must ensure that the means of production owned by the whole people are protected from damage.

2. The state must have the power to oversee the use of the means of production by the enterprises under the ownership of the whole people. It must be able to use various economic levers to promote the improvement in economic effect of the use of the means of production by the enterprises. It must have the power to exercise intervention, and even to close enterprises, suspend production in enterprises, merge enterprises, or shift enterprises to other types of production.

3. The state must have the power to guide and control production of the enterprises via the means of planning.

4. The state must have the power to distribute and benefit from the net income created by the enterprises, and also to stipulate the principles governing the use of the enterprises' after-tax profits.

5. On the basis of fully respecting the democratic rights of the staff and workers of the enterprises, the state must have the power to dismiss, reward or punish the principal leading cadres of the enterprises.

To sum up, to divide economic powers between the state and the enterprises in this way is only for the sake of perfecting the internal relations in the system of ownership by the whole people, and not for negating this system. Of course, when the enterprises under the ownership of the whole people really assume sole responsibility for their profits and losses, they will demand greater decisionmaking power. To a certain extent, this will indicate the separation of economic powers between the state and the enterprises. It seems that this will weaken the state's power over ownership of the means of production. However, actually, the assumption of sole responsibility for profits and losses will enable them to be closely integrated. Economic experience has shown that although under a management system marked by the assumption of responsibility for profits and losses solely by the state and marked by a high degree of concentration of power, the state's ownership power seems to be quite adequate and secure. However, because the enterprises are devoid of power, responsibility and benefits, the means of production cannot be managed really satisfactorily. A great deal of the means of production in the custody of enterprises under the ownership of the whole people have been deliberately damaged or wasted, and an even larger quantity of the means of production have not been fully utilized. Actually, the state's ownership power has thus been weakened. With the assumption of sole responsibility for profits and losses, the enterprises, proceeding from the consistency of their own interests with the state's interests, will exercise their decisionmaking power consciously, will strive to continuously improve the economic effect in their use of funds, and will thus enable the material substance of the state's ownership power to be continuously enhanced.

II

The assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people differs from the assumption of such responsibility by the enterprises under collective ownership, not only qualitatively, because these two categories of assumption of sole responsibility embody different ownership relations, but also quantitatively, because the scope in which, and the extent to which, these two categories of enterprises shoulder responsibility for profits and losses differ.

Considering the scope in which enterprises assume sole responsibility for profits and losses, those enterprises under collective ownership must shoulder complete responsibility for the profits and losses arising from their own production activity and operations, whereas for the enterprises under the ownership of the whole people, their responsibility for profits and losses is limited by their functions and powers in the domain of management and operations. For the latter, if they earn excessive profits because the state has provided them with excellent means, such as in terms of funds and technology, or if they incur losses because of mistakes in state planning, then in principle, they must not shoulder responsibility for such profits and losses.

Considering the extent to which enterprises assume sole responsibility for profits and losses, in regard to those enterprises under collective ownership, after they have paid taxes to the state, all the remaining profits will belong to their workers. All losses must be sustained by themselves and their workers, to the extent that their assets may have to be sold to cover the losses. Things are different for the enterprises under the ownership of the whole people. When they obtain profits, they must ensure benefits for the state as a priority, and they can claim only a portion of the profits. If there are losses, they should, in the first place, employ reserve funds or production development funds to cover the losses, and when the losses cannot be adequately covered in this way, they will have to use part of the staff and workers' wages as compensation. However, it must be ensured that the staff and workers' wages must not fall below a certain minimum, and moreover, their assets must not be sold at will for the sake of covering the losses. When they are incapable of bearing the responsibility for losses, the state will have to grant subsidies. For those enterprises whose operations cannot continue on account of their losses, the state must take measures to support them, close them, suspend their production, merge them with other enterprises, or shift the workers to other occupations. When enterprises under the ownership of the whole people close down, the state must accommodate their staff and workers in a centralized way.

Why are there differences in the scope and extent of responsibility for profits and losses for the two different categories of enterprises, namely those under the ownership of the whole people and those under collective ownership? It is because the degree of public ownership is different for the two categories of enterprises, so that there are differences in the extent to which, and the style in which, the enterprises' power, responsibility and interests are integrated. The enterprises under collective ownership have the power not only to possess, use and allocate, but also to own, the means of production. Correspondingly, their economic responsibility and economic interests are relatively complete. They must assume complete responsibility for their own profits and losses. On the other hand, the enterprises under the ownership of the whole people merely have the power to possess, use and allocate the means of production in their custody. Moreover, they are empowered to benefit from merely part of the fruits of their operation. Correspondingly, their economic responsibility must inevitably be incomplete, so that actually they assume responsibility for profits and losses on an incomplete and relative basis.

The relative nature of the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people is essentially embodied in the dual character of this kind of assumption of responsibility, namely, for one thing, the economic realization of the enterprises' power to possess, use and allocate the means of production, and for another, the economic realization of the state's power to own the means of production. Because of this dual character, we must clearly know the jurisdiction of the enterprises and of the state in matters of management when we want the enterprises under the ownership of the whole people to assume sole responsibility for profits and losses. Not only must the enterprises assume responsibility for profits and losses in the light of their own functions and powers, but those bodies in charge of economic leadership and management, which exercise powers on behalf of the state, must also shoulder responsibility for those profits and losses which they should be responsible for, in view of their functions and powers. In our country, over many years, great losses and wastes have been caused by the enterprises' own actions; however, losses and wastes to an even more serious extent have been due to macroeconomic disproportion and mistakes of higher organizations in management. Therefore, when we require the enterprises under the ownership of the whole people to assume sole responsibility for their profits and losses, we must proceed from the dual character of this kind of assumption of responsibility, and require both the enterprises and the leading bodies concerned in charge of management to share in the responsibility for profits and losses. Therefore, when the enterprises under the ownership of the whole people assume sole responsibility for profits and losses, this move not only appears as a reform of the enterprise system, but calls for a simultaneous reform of the entire economic system. If we do not understand this point, it will be difficult to really implement the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people.

III

The relative and incomplete nature of the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the wh[illegible]ple is also reflected in the distribution of the enterprises' profits. [illegible]ibution of the profits of those enterprises which assume sole responsibilit[illegible]rofits and losses is effected through the payment of various taxes to the state by the enterprises and the subjecting of the after-tax profits to allocation by the enterprises. Just like the enterprises under collective ownership, the enterprises under the ownership of the whole people must pay various taxes, deducted on behalf of society, to the state. Moreover, they must also pay to the state various taxes arising from the power to own the means of production, such as taxes for the possession and use of funds, resources taxes, and so on. For these enterprises, whether the designed types of taxes are rational is related to whether the role of such taxes as economic levers can be fully brought into play. This is naturally a very important point. The levels of tax rates are related to whether profits are distributed in an appropriate ratio between the state and the enterprises. This is an even more important problem which we must study vigorously.

To determine an appropriate ratio, we must in the first place clearly know what factors affect and determine this ratio. We think that generally there are two main factors. The first factor is the enterprises' need for a definite amount of economic benefit from their production, due to the enterprises' role as relatively independent producers of commodities. (The magnitude of this need varies with differences in the enterprises' circumstances and with different requirements of the readjustment of macroeconomic proportions in different periods.) The second factor is the amount of fiscal funds needed to be centralized by the state as society's overall representative. What we describe as the enterprises' need does not refer to the subjective desires of the leaders, staff and workers of the enterprises, but refers to the economic benefit which corresponds with the enterprises' economic powers and economic responsibility arising from their assumption of sole responsibility for profits and losses. The quantity of fiscal funds needed by the state depends mainly on the objective needs of state fiscal expenditure. Both the magnitude of the enterprises' need and the amount of fiscal funds needed by the state are to a certain extent flexible. However, there is a limit to this flexibility. The appropriate limit to the "enterprises' need" is that its magnitude must not be smaller than what is needed to maintain simple reproduction, to provide for the staff and workers' welfare, to distribute bonuses, and so on. The appropriate limit to the "amount of fiscal funds needed by the state" is that it must not be smaller than the minimum required amounts of social consumption funds and social accumulation funds in the state's fiscal expenditure. However, to determine a rational ratio of distribution, we must discover an optimum point somewhere between these two limits. What are the factors affecting this optimum point? The principal factor is determining jurisdiction with regard to expanded reproduction between the state and the enterprises. It is because in considering the four categories of substance in the enterprises' need, the production development funds exhibit greatest flexibility, and the other categories are relatively stable. Considering the state's fiscal matters, generally speaking, if revenue is steady, the flexibility of certain expenditures, such as those on national defense, scientific research, education, subsidizing commodity prices and so on, is limited. Such expenditures can be satisfactorily estimated. The question is that capital construction expenditures account for a large proportion of the total expenditure and are also highly flexible. Therefore, to determine a ratio according to which profits are to be distributed between the state and the enterprises, we must mainly consider how to work out a ratio by which funds for expanded reproduction are to be distributed between the state and the enterprises. In distributing such funds, we must consider whether the distribution is conducive to mobilizing the enthusiasm of the enterprises, and whether it helps the state grasp the power of leadership over the national economy. However, our consideration should basically proceed from whether it is conducive to bringing the economic effect of investment into play. Thus, we must proceed from the actual circumstances, such as the level of the productive forces in, and the economic structure of, our country at the present stage; we must carry out technological and economic forecasting and study what proportion of investment undertaken by the state, coupled with what proportion of investment undertaken by the enterprises, will produce the optimum overall economic effect in a given stage. This should be taken as the basic criterion in determining jurisdiction with regard to expanded reproduction between the state and the enterprises.

Moreover, in the light of the requirement of the planned development of the national economy, we must define the jurisdiction of the state and the enterprises with regard to expanded reproduction. Our defining of the jurisdiction must be based on various macroeconomic and microeconomic levels. In view of the many years of experience in economic planning and also the experience in the use of the enterprises' production development funds over the past 2 years, we may consider dividing the jurisdiction over expanded reproduction into sic levels: First, the level of national economic sectors; second, the level of industrial sectors; third, factories undertaking socialized or specialized production; fourth, medium-sized and small factories whose products cater to local needs; fifth, the level of major products; and sixth, the level of product variety, specifications and design. At the first and second levels, the power of investment should be mainly vested in the state. At the fourth, fifth and sixth levels, the power of investment should be mainly vested in the enterprises. The situation of the third level is rather complicated. We should determine the appropriate magnitude of the power of investment in expanded reproduction to be assigned to the enterprises in the light of differences among various enterprises in their production activities and products. For those specialized factories which have attained a high degree of socialization in production, whose products are of a single variety, and which can be conveniently subjected to statistical check, planning and supervision by society, such as modern electric power stations, power-generating plants, large-scale equipment for producing chemical fertilizer and so on, the state should take responsibility, in a centralized way, for their geographical distribution and for investment in connection with them, and should provide them only with those funds for maintaining simple reproduction and small amounts of funds for expanded reproduction. There are some specialized factories and combined enterprises which have attained a high degree of socialization and which can be conveniently subjected to statistical check and supervision by society, but whose product variety is extensive and whose product quality varies greatly. Examples are large machine-building factories, combined iron and steel works, and so on. The state should give them the necessary power of expanded reproduction. The state should assign even greater power over expanded reproduction to those specialized factories whose products exhibit great variety, involve numerous different specifications, and are quickly replaced by new generations of products. Consequently, different trades or enterprises differ in the extent to which they assume responsibility for profits and losses. The state may regulate them by means of different types of taxes and different tax rates.

IV

The assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people includes an inherent requirement of regulating, on a full scale, the differentials in the enterprises' income.

Income differentials represent excessive profits earned by some enterprises by virtue of their objectively superior conditions of production and operations. It should be noted that regulating the enterprises' income differentials constitutes an objective requirement of socialist production relations, because the existence of income differentials is contradictory to the socialist principle of equal benefits for equal amounts of labor. Considering this point, the assumption of sole responsibility for profits and losses by both the enterprises under the ownership of the whole people and the enterprises under collective ownership includes the requirement of regulating income differentials. However, the scope and extent of the regulation required differs between the two categories of enterprises. For the enterprises under collective ownership, only the regulation of part of the income differentials is required, and the state will have no power to regulate those income differentials caused by certain factors such as differences in the enterprises' technical equipment, and so on. Such income differentials can belong only to the enterprises. The assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people requires the regulation of income differentials among the enterprises on a full scale, because this kind of assumption of responsibility is connected merely with the effect of the staff and workers' labor and the effect of management and operations. Therefore, the enterprises' after-tax profits should be a sensitive indicator of the effect of the staff and workers' labor and the effect of management and operations. Such profits should not embody profits or losses due to objective conditions, such as prices, taxation, differences in technical equipment, resources or geographical location, and so on. The part of the profits or losses arising from these factors should change according to the power of ownership (or power of decisionmaking) governing these factors.

Judging from the practice of the experimentation conducted in Sichuan on the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people, the problem of regulating the income differentials among the enterprises on a full scale has been increasingly and markedly manifested as a characteristic of the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people, and has been viewed as an important matter by various circles and parties. We believe that if we base our ideas on a profound understanding of the general contents and specific characteristics of the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the people, and if we adopt the necessary measures to solve the practical problems realistically, step by step and in an orderly way, then the work of experimenting on the assumption of sole responsibility for profits and losses by the enterprises under the ownership of the whole people will develop healthily and steadily along the correct orientation.

'JINGJI GUANLI' ON PRIVATE INDUSTRIALISTS

HK021011 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 7, 15 Jul 81 pp 31-34

[Article by Liang Zhuanyun [2733 0278 6663] of the Industrial and Commercial General Administrative and Management Bureau: "Problems Concerning the Restoration and Development of Individual Industrialists and Businessmen in Cities and Towns"--note passages within slantlines denote boldface type]

[Text] Individual industrial and commercial households in cities and towns are an important part of the individual economy in cities and towns and they constitute nonagricultural individual laborers. Following the 3d Plenary Session of the 11th CCP Central Committee, the Party Central Committee has, in order to promote economic activities, suggested that under the premise that the socialist public ownership has overwhelming superiority, a diversified economy should be allowed to exist while individual industrial and commercial households in cities and towns should be properly rehabilitated and developed. Facts prove that this policy is totally correct.

The Importance of Rehabilitating and Developing Individual Industrial and Commercial Households

Small businessmen and pedlars carry out their business in a diffused and flexible manner and they are able to readjust the varieties of their products in their efforts to promptly meet the needs of the people and to accommodate themselves to market changes. They may have fixed shops, set up stalls or sell their goods in streets and lanes to provide service on customers' doorsteps and therefore they are welcomed by the broad masses of consumers. In particular, the small businessmen and pedlars in rural areas are often engaged in both selling and purchasing and therefore such a practice is very much in line with the habit of exchanging goods that is very common in the countryside. Thus with such features, small businessmen and pedlars are supported by the masses and consequently they have vitality.

Negative and positive practice over the past 3 decades has proved that under the premise that the state economy and collective economy are in overwhelming superiority, it is of great significance to develop production, promote market activities, meet the needs of people's life and expand employment by actively supporting and properly developing individual industrial and commercial households in cities and towns.

/First, by developing individual industrial and commercial households we will be able to supplement the state and collective economies./ Our commercial networks have long been deficient. Take the catering trade for example. Investigations in 48 cities have shown that the number of catering points in 1979 was 90 percent less than in 1957. This means that over a period of 20 years, the number of catering points has dropped from 110,000 to 11,000. In early liberation days, the number of cities with more than 50 catering points for every 10,000 head of population was several hundred. Now there are only a handful of cities that have more than 5 points for every 10,000 head of population. It is true that over the past few years, the number of catering points in cities has considerably increased, but that is the result of the merging of the state and collective catering points with individual points which constituted a greater proportion. For example, of the catering points in Xinxiang City of Henan Province, 8 percent belong to the state, 44 percent to the collective and the remaining 48 percent to individuals. The number of catering points run by individual households in Guilin in Guangxi Province, Shangqiu in Henan Province and Liuan in Anhui Province made up two-thirds of the total catering points in each province while the proportion of state-run catering points is less than 10 percent. It is very striking at present that the number of service points lags far behind social need. But Zhengzhou City has to a certain degree solved this problem through developing individual households. For example, 20 households have been permitted to process clothing in the agricultural and sideline products market in Huayuan Street of the city. They receive 200 to 300 customers per day and they are welcomed by the masses. The masses also have complained about the shortage of repairing points. It is said that Beijing, with 3 million bicycles, has only 177 bicycle repair points and they are run by the state and the collective. Thus, an average of one repair point for every 17,000 bicycles can in no way meet the needs of the masses. Some individually-run repair points have recently begun to be developed, which is welcomed by the masses.

Individual industrial and commercial households are most suitable for undertaking scattered business focusing on handicrafts and other trades that are closely related to the people's life. In these aspects, individual industrial and commercial households are superior to the state and collective economy. For example, to totally depend on the state and collective economy in such trades as cotton fluffing, mending pots and pans, sharpening knives, repairing furniture and preparing specially tasty snacks, it is hard to meet the needs of the people. It is exactly in these aspects that the individual economy may make up for the shortfalls in the state and collective economy.

/Second, proper development of individual industrial and commercial households is in the interest of expanding employment./ At present there is a considerable number of people awaiting employment; some of these people may be employed by state enterprises but most must be employed by collective enterprises or through their own individual efforts. Practice has proved that the method of the state being totally responsible for arranging the labor force in cities and towns has not been successful and according to this method our road has been becoming narrower and narrower. On the other hand, the individual economy is easy and practicable and quick for solving problems and therefore we must make use of this channel. Investigations show that of the 4,317 individual households granted business licenses in Guangzhou early this year, 2,700 people were newly employed. In Shenyang, more than 3,000 people were employed last year because of the development of individual households; more than 1,500 badly off people had their problems resolved after they were given temporary licenses.

/Third, proper development of individual industrial and commercial households will help the diversified economy to launch competition./ People often criticize that for dozens of years the products of our enterprises have been low in quality with few varieties and the service quality of our shops has been low and service attitude bad, coupled with a serious "bureaucratic commercialized" style of work. Of course there are many reasons for this consequence and one of them is that these aspects are monopolized by the state economy without any competition. In order to overcome such shortcomings in economic activities, it is necessary as one of the methods to allow the diversified economy to launch competition. Facts have proven that this method is very important for some enterprises to improve the quality of their products and their style of business. A noodle shop in Shenyang that is run by the state had business hours from 8:00 to 9:00 am until 4:00 to 5:00 pm and it sold nothing but noodles and consequently business was not good. But last year there were two or three individual households selling deep-fried twisted dough sticks in front of the shop. They began their business early in the morning and closed late in the afternoon. Their business was good and they drew a lot of customers to the shop. Seeing that this situation was threatening their interest, the staff of the shop also got up early in the morning and they began to sell twisted dough sticks. They sold them at a lower price and of better quality and consequently they squeezed the individual households out. The service attitude and quality of the shoe-repair shops in Beijing have improved over the past few years and people say that it is largely because there is competition between these shops and the service given by individual households.

In addition, by developing individual households the state will have more revenue. In this way, we will also be able to resume the production of some traditional handicraft articles and skills and foodstuffs with local features and flavor so as to enrich the life of the people.

Obstacles in Rehabilitating and Developing Individual Industrial and Commercial Households

It is true that individual industrial and commercial households in cities and towns have developed quite rapidly over the past few years, but from the viewpoint of the whole country, the development is far from balanced. So far only Liaoning, Heilongjiang and Jilin provinces have made rapid progress in this matter. Up to the end of August last year, the number of individual industrial and commercial households in Beijing was 1,298 as against 10,000 in Shanghai and more than 4,300 in Tianjin. The majority of the staff of such households are social idlers rather than those who are approved by the departments concerned. The number of young intellectuals who are awaiting employment is very limited in such households. Investigations show that 80 percent of those engaged in individual business are social idlers and the figure for young intellectuals is less than 10 percent. The proportion of young intellectuals is even smaller in some places.

For example, of the 5,828 individual households that were given licenses in Shenyang up to the end of July last year, 49.5 percent were social idlers, 45.6 percent were retired staff and 1.8 percent were young intellectuals. Most of these people are engaged in commerce, catering and service and repair trades; only a few are engaged in handicraft and transportation. The investigations in Guangzhou carried out early this year show that of the 5,022 households that have been granted licenses, 48 percent are engaged in commerce and catering and 9 percent in handicrafts. This shows that some problems have yet to be resolved before we are able to develop individual industrial and commercial households.

/First, the question of understanding, particularly the understanding of some leading cadres./ Some people hold that developing individual industrial and commercial households will foster such styles of business as speculation and profiteering; others are even worried that with the development of such households, capitalism will become rampant. Some comrades who are responsible for this work have been warned that by developing such households they will make mistakes. A district leading cadre in Luda said not long ago: "I was criticized during the great cultural revolution because I had developed individual households and now it is necessary to consider carefully in developing such households." In order to clarify such vague understanding it is necessary to clarify: First, is developing individual households developing capitalism? The answer is no. That is because the individual industrial and commercial households we are talking about are individual laborers and they are part of the individual economy. The individual economy came into existence long before the emergence of capitalism and it is a subordinate economy. Of course, the individual economy has some negative factors that will give rise to some problems if we relax our vigilance. But as long as we are able to strengthen our management, we will be able to make this economy subordinate to the socialist economy so that it will not cause danger. Second, will the development of individual industrial and commercial households give rise to unhealthy tendencies such as speculation and profiteering? This question has to be analyzed. It is right to say that with the development of individual industrial and commercial households there will appear capitalist business style such as speculation and profiteering. But speculation and profiteering are related not only with developing such households, they have a deeper reason for their existence. And this reason is the level of development of productivity and the level of people's consciousness. But the basic way to eliminate such tendencies is to constantly develop productivity and heighten people's ideological consciousness. We cannot, just because the development of individual households may give rise to unhealthy tendencies, restrict the development of such households. The key for preventing a capitalist business style from developing is to strengthen management.

/Second, is the question of policy./ Simply speaking, the past policy for individual industrial and commercial households was that for capitalist industry and commerce. That is the policy of "utilization, restriction and restructuring." The general principle for such households was that they "could only be decreased but not increased" and finally they were to be abrogated. For example, such households were not allowed to open accounts with banks and they were not entitled to get loans from the banks. As a result, they could only engage in small business and they could not have substantial economic relations with the state and collective economy. During a long period, such households had to pay progressive tax. Under such a tax system, they had to pay 7 percent tax for an annual turnover of less than 120 yuan, 8 percent for 120 to below 180 yuan and 62 percent for an annual turnover of more than 1,320 yuan. It was also defined that they had to pay additional tax in four categories. That is to say, they had to pay an additional

10 percent tax for an annual turnover of 1,800 to below 2,500 yuan; an additional 30 percent tax had to be paid for an annual turnover of 3,500 to below 5,000 yuan; and an additional 40 percent tax for an annual turnover of over 5,000 yuan. It was thus difficult for such households even to make little profits. Such taxes were levied arbitrarily in some places and consequently it was difficult for such households to continue with their business.

The problems of the supply of goods and materials were even more serious. Commercail departments do not supply such households with commodities that are in short supply, while the supply of sugar and meat is restricted. Grain departments at most can only supply them with limited amounts of low-priced grain and edible oil. Goods and materials departments do not guarantee the supply of tinplate for repairing pots and pans and nails for repairing shoes. All this hampered the development of such households. For example, a hand-pulled noodle shop and a cold noodle-in-sauce shop that are respectively situated in Taipingqiao market and Sidao Street of Western Daoli District in Harbin can only use flour that is purchased at negotiated prices and consequently they have to sell their noodles at 0.15 yuan per liang and this price is over 100 percent higher than state-owned shops. It will be difficult for these shops to continue with their business in this way. Recently, more than 3,000 individual households in Shenyang Municipality have suspended or temporarily closed down their business because they did not have enough supply of goods.

The political treatment of individual households also has to be studied. One reason that only a few young intellectuals who are awaiting employment joined such households is that such individual households have a low social position while their political treatment is yet to be resolved. The young intellectuals who joined such households do not have social insurance and nobody cares about the length of their service and whether they want to join the party of CYL. That is why most of the young intellectuals that are awaiting employment would rather lead an idle life than working with such households; some who have joined such households regard their work as an expedient measure and do not intend to keep their jobs for long.

/Third, is the question of management./ The management over individual industrial and commercial households is very chaotic at present. In many places, such households are under the management of neighborhood committees, urban construction departments, business departments, industrial and commercial administrative departments and even public security departments. But such management is nothing but restriction or these departments are only responsible for collecting management fees and do not care about the business difficulties of these households. Government departments do not know even the basic situations of such households and therefore they are not in a position to guide and manage these households.

Strengthen Leadership and Management Over Individual Households

More people have come to gradually see the positive roles of rehabilitating and developing individual industrial and commercial households. But we must understand that such households belong to the private economy that has a negative aspect. For example, such households have a tendency of making progress blindly and they may care about nothing but making money and consequently cause social waste. They may also develop a capitalist business style such as engage in speculation and profiteering, confuse the genuine with the sham or give short measure or with such households it may be difficult to guarantee traffic safety and food hygiene. Therefore it is imperative to strengthen management over such households.

/First, strengthen iedological education./ It is necessary to repeatedly disseminate the party and government principles and policies among individual households and to educate them to be law-abiding, to resort to just trading and to serve socialism with their own labor and to educate them not to live on exploitation nor reap without sowing. We must in particular be concerned with the progress of the young intellectuals that are working with such households so that they will understand that such work is part of socialist labor and feel that it is glorious to do the job.

/Second, resort to economic measures to guide the healthy development of individual households./ The state must use the supply of goods and materials to intentionally support the business of individual households that is needed by society and restrict the business that is not suitable socially. Economic levers such as tax and interest must also be used to regulate the development of individual households. Not long ago, inland revenue departments temporarily stopped levying aggressive taxes on such households and instead, various places may levy taxes on such households as they do on the collective handicraft industry. Banking facilities have also relaxed their policies toward individual households. The individual households that have won licenses and that are doing just business and are able to repay are allowed to open bank accounts and they may ask for certain loans. These measures will no doubt play positive roles in developing individual households. All our economic policies are to serve socialist politics and therefore these policies must include encouraging just business and opposing illegal activities. For example, as a support for the young intellectuals who are undertaking individual economy, they may be permitted during a certain period to pay less or be exempted from tax; but this method is not applicable for other staff of individual households. The individual households that do not have licenses must pay tax according to the tax rate of "temporary business." Such households must pay additional tax once their profits exceed the quotas. Such a measure is not only to restrict the development of such households but is also a different treatment for the individual households with and without licenses. The individual households that should not enjoy support should not be permitted to open bank accounts, nor should they be given loans. Such households that have opened accounts should have their accounts cancelled or if they have been granted loans, these loans must be frozen. All this is aimed at directing the development of individual households.

/Third, strengthen administration and management over individual industrial and commercial households./ All individual industrial and commercial households must register and receive business licenses from industrial and commercial administrative departments in the places where they are located; no household is allowed to start doing business without approval. The industrial and commercial administrative departments must check and supervise individual households and often investigate the quality and prices of their products. Unhealthy business methods such as crude processing and replacing quality products with low-quality products must be corrected promptly while illegal activities such as speculation and profiteering and exploiting staff must be stopped. The individual households that have violated the state policies and laws must, according to the seriousness of their case, be educated, fined or have their licenses cancelled. Legal action must be taken with regard to serious offenses.

In order to manage individual households effectively it is imperative to help them establish mass organizations for self-education. In the past, individual households had their own organizations for self-education. In the past, individual households had their own organizations such as pedlars unions and handicraft unions and it is our duty to help them rehabilitate such organizations as soon as possible.

SUPPORT FOR COLLECTIVE ECONOMY IN CITIES, TOWNS URGED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 8, 4 Aug 81 pp 16-17

[Article by Zhang Zhongshan [1728 1813 1472] of Gansu Branch of People's Bank of China: "Vigorously Support the Development of Collective Economy in Cities and Towns"]

[Text] The collective economy in cities and towns is an important component of the national economy as well as a strong economic force for realizing the four modernizations. The vigorous development of the collective economy in cities and towns is of great significance in developing production, enlivening the market, providing job opportunities and serving the people in production and daily life.

The Strong Vitality of Collective Economy

Both the collective economy and the state economy are under the system of socialist public ownership, but compared with the state economy, the collective economy has its own special features and strong points. Collective enterprises are generally organized by the laboring masses with self-raised funds or the investments of shareholders, and no state investment is needed. Apart from the taxes paid to the state, all the products of these enterprises are the property of the workers. They are small and can be operated in many different forms, and with greater decision-making power in their business operation. Their operational flexibility in meeting various social needs plays an important role in filling up certain gaps left in the state economy. The equipment for production in these enterprises is rather simple, mostly requiring high labor intensity. This is an important factor in the solution of the employment problem. Since these enterprises have their own independent accounting and the responsibility for profits and losses, personal gains are closely related to the success of business; this serves as an impetus to the workers in production and management. Besides being regulated by state planning, a fairly large portion of their supply and marketing is regulated by market conditions. Collective commerce is an important link between the city and the countryside and between production and marketing, and has the responsibility of catering to the consumers' needs. Collective commerce and state commerce combine to form a multichannel network for the circulation of commodities, and thereby help enliven the market and the economy. These are the special features that have a decisive effect on the rapid development of the collective economy in cities and towns, and on its better results. If the 1970 total industrial output value of Gansu Province is used as the base figure, then by 1980, the output value of units owned by all the people increased by only 85.67 percent, while that of units owned by collectives increased by 258.37 percent. In 1980, the total amount of profits earned by state-operated industry in Gansu Province was less than one-sixth the value of fixed assets; in the same year, however, the profits earned under the system of the collective economy in cities and towns amounted to one-quarter of the value of fixed assets. In 1979, 2 workers were employed for every 100 yuan's worth of fixed assets under state economy; under the collective economy, however, the same amount of fixed assets could provide employment for 11 workers.

From the above, we can see that the collective economy in cities and towns has been able to survive and develop mainly because of its adaptability to our productive forces at their present level, plus the many other advantages which the state economy does not enjoy. Hence, the vitality of the collective economy. As long as we provide the correct guidance, adopt flexible policies and strongly support its production, the collective economy will play an even greater role in the four modernizations by forming a mutually supplementary relationship with the economy of the whole people.

Problems Confronting Collective Economy

1. Shortage of funds, material and manpower. For many years, the state has given little financial support to collective enterprises. After tax payment, the major portion of the remaining profits was kept by the higher level departments in charge, and only a very little was left for the enterprises to use as accumulated funds. Therefore, expanded production was difficult. In 1979, for example, Lanzhou Municipality invested 3.04 million yuan in capital construction under the collective economy, and this amount was only 8 percent of the total investments in capital construction for the municipality. It was further stipulated in unequivocal terms that no graduates from universities or vocational high schools could be assigned to collective units. Moreover, the production of these units could not be included in state planning, and there was no guarantee of a supply of the required equipment and raw materials. Thus the development of the collective economy was seriously hampered.

2. Low wages and limited fringe benefits. In 1979, the average wage of a worker of the collective industry in cities and towns throughout the country was 515 yuan, 190 yuan less than that of his counterpart in a state-operated unit. In the same year, 62,416 workers in the collective sector of the province were not elegible for a nonstaple-food subsidy. Workers of many collective units could not enjoy labor insurance, retirement benefits or free medical care during retirement.

3. Heavy tax burden, high tax rate and low minimum taxable income. Before 1956, the state collected progressive taxes from collective enterprises at the rate of 5-36 percent within fixed limits. Now, unlimited progressive taxes are being collected up to 7-55 percent. For this reason, some small collective enterprises lacked the courage to expand their business, while the large collective enterprises were increasingly impoverished.

4. Lack of guiding ideology for banks in dealing with collective economy. Some comrades in banks held the view that the collective economy is only a transitional form which should be taken advantage of, restricted and remolded; therefore, it is not entitled to the same treatment as that given to the system of ownership by the whole people. Furthermore, in view of the large number of collective units in the

cities and towns, their weak economic foundation and their personnel from diversified class origins, these comrades were afraid that the loans could not be redeemed by them. Therefore, these comrades refused to grant loans under any pretext; if they granted any at all, they would reduce it to a minimum. In some localities, banks were unapproachable for loans. They were particularly strict in opening or settling the accounts of collective enterprises, thus creating more difficulties for these enterprises.

5. The problems of duplicated construction, blind production and competition for tasks, materials and technology in the collective economy. In Pingliang County, for example, there are six collective enterprises utilizing waste paper as raw material. Formerly there was an "overabundance" of waste paper; now there is a scarcity. If the required material has to be imported from Xian, the cost of each ton of waste paper will be increased from 70 to 140 yuan, and this high production cost will result in poor sales. There are huge stockpiles of coarse paper and toilet paper, and two old plants in Pingliang--one paper mill and one fiberboard plant--were forced to close down. This is an indication of some problems in overall planning and readjustment in developing collective economy.

All these problems are inseparable from the effects of "leftist" ideology which claimed that "the bigger a productive unit is, the higher should be the degree of its public ownership." For many years, the collective economy failed to receive the consideration it deserved; even for a time it was treated as a "capitalist tail" and the "soil for breeding capitalism" and therefore given the axe. Whenever there was an opportunity, there would be irrational "escalations" and "transitions" which restricted the development of collective enterprises.

Banks' Obligation To Support Collective Economic Development

In order that the collective economy can play its proper role in the national economy, we should conscientiously sum up our experiences, draw our lessons, emancipate our minds and arrive at a correct understanding. We should also adopt more flexible policies and carry our readjustments. In dealing with collective enterprises, the departments concerned should uphold the principle of "helping it to mount the horse and escorting it to a certain point," and "allowing a period of rest for the sake of recovery." They should take positive action to "loosen the fetters and smash the locks" in a vigorous effort to support the development of the collective economy. The banks, on their part, should quickly correct their wrong ideas about collective economy, and support it by extending loans and providing facilities in the settlement of accounts. They should also guide them in financial bookkeeping so as to expedite the improvement of their business management.

In granting loans, the banks should continue to uphold the principle of "giving preferential treatment to the best" instead of arbitrarily imposing restrictions. If collective enterprises are making good use of their resources and producing easily saleable goods, the banks should actively support them. The banks should also grant loans at appropriate times for the purpose of tapping potentials, renovation and transformation among the collective enterprises, so that their equipment can be upgraded or replaced. In dealing with funds needed by collective retail stores or commercial cooperatives for the purchase of goods, loans should be granted according to the minimum standard. In granting loans, however, they must be careful to avoid any further extention of the capital construction front. Bearing in mind the need to create more job opportunities and to bring into play the strong points of each locality, they should correctly implement the credit policy by treating every case on its own merits so as to promote the healthy development of the collective economy.

State funds indirectly appropriated by collective enterprises should as a rule be replaced by direct bank loans. There have been many restrictions on granting loans, and on the opening and closing of accounts for the collective enterprises. This has resulted in the overdue repayment of their loans. There was also encroachment on one another's funds so that finally the state economy had to be chiseled. This is an indirect way to use state funds. Therefore, instead of allowing them to use state funds, it would be better for the banks to extend them direct loans. To solve the employment problem for the sons and daughters of their workers and staff members, some large plants have specially allocated funds, equipment and even raw material to set up small collective factories, which were in fact equivalent to workshops affiliated with the large plants. Some of these investments took the form of advanced payments; others were simply given free. In essence, this is the use of state funds in the collective economy. Therefore, we should try our best to create favorable conditions for large plants to operate collective enterprises so that the funds for these plants, instead of dying down indefinitely, would be replaced gradually by bank loans.

It is suggested that cooperative banks be set up in cities and towns for the unified handling of deposits, loans and remittances as a facility for these collective enterprises, so that money from a collective source will be spent on collective undertakings. This will be a more effective way of using loans and interest rates as economic levers to supply funds for the development and regulation of the collective economy.

We should actively assist the collective enterprises in cities and towns to clear the channels for production, supply and marketing and to solve real problems in production. At present, collective industrial enterprises are mainly dependent on the processing of materials supplied by customers and industrial-commercial contracts, besides producing and selling their own goods. The raw materials sources for them are not included in the state planning, and they have to "look for rice to cook their meals." As to the marketing of their products, they can only rely on their own efforts in the absence of a regular contractual relationship between them and the commercial procurement departments. That is the cause for occasional overstocking which tied down the circulating fund. With their wide range of contacts and their ability to promptly reflect on the general situation, the banks therefore should take advantage of their special position in helping the enterprises, through industrial or commercial loans, make reliable market forecasts, ascertain the laws of supply and demand, produce easily marketable goods and strengthen their own competitive power. There will then be steady progress and sustained development for the collective economy.

FINANCIAL RESPONSIBILITY SYSTEM PAYS OFF IN HEBEI PROVINCE

Shijiazhuang HEBEI RIBAO in Chinese 30 Jul 81 p 1

[Article by correspondent Ji Cainong [0370 6299 6593]: "Profits Continue To Increase Every Year After Introduction of Financial Responsibility System for Farms and Pastures in Hebei"]

[Text] The system of financial responsibility adopted by 33 state farms and pastures has shown remarkable economic results.

For a long time, many farms and pastures suffered losses. After the introduction of the system of financial responsibility, they made a total profit of 3.7 million yuan in 1977. It was raised to 26.68 million yuan in 1978 and 34.46 million yuan in 1979. In 1980 despite various natural disasters and other causes of poor harvests, their profits still remained as high as 48.21 million yuan, which was 12.8 times that of 1977. The reform of the financial system has not only reduced the state's burden, but also changed the conditions of production at state farms and pastures. According to statistics, the surplus funds retained by the farms and pastures, after fulfilling their quota, amounted to more than 100 million yuan, or twice the state investments in the province's capital construction from 1972 to 1979. The income of workers and staff members has also been increased. The farms and pastures have also appropriated 20 million yuan to build dormitories for the workers with a total floorspace of 250 million square meters which is equivalent to the total floorspace of houses built with state funds in the past 10 and more years. The housing situation characterized by "three generations being crammed in the same house with inadequate protection against inclement weather" has been basically changed.

As present, the broad masses of cadres, workers and staff members of various state farms and pastures in the province are conscientiously summing up their experiences of the responsibility system, and, on this basis, revising the rules and regulations in an effort to improve business management and to achieve even greater success this year.

FINANCIAL SUPERVISION NEEDED TO CHECK UNHEALTHY TENDENCIES

Beijing ZHONGGUO CAIMAO BAO in Chinese 1 Aug 81 p 1

[Article by unidentified correspondent: "Uphold Financial and Economic Discipline, Check Unhealthy Tendencies--Many Localities Have Set Up Organs To Exercise Financial Supervision"]

[Text] Under the leadership of the party committees and the government at various levels, the financial supervisory departments in many localities have actively carried out investigations on cases of violation of financial and economic disciplines since last year. According to incomplete statistics, more than 12,000 cases involving more than 689 million yuan have been brought to light. By now, some 9,100 cases have been closed and some 251 million yuan recovered.

Acting in accordance with "Several Regulations Concerning Financial Supervision Issued by the Ministry of Finance" approved and relayed by the State Council, many localities and departments have formed and improved their own financial supervision organs. By now, financial supervision centers have been set up in the financial bureaus of all 29 provinces, municipalities and autonomous regions of the country, while the financial departments of some 320 prefectures, municipalities (prefectures and leagues) and some 1,400 counties have either set up their own supervisory organs or included professional financial supervisors in their personnel. Throughout the country there are now more than 3,500 financial supervisory cadres, more than doubling the number since 1979. Among the various ministries, commissions and other organs directly affiliated with the State Council, 31 of them have already set up, or are preparing to set up, financial supervisory organs.

In 1980, acting in accordance with the spirit of "Several Regulations Concerning Financial Supervision Issued by the Ministry of Finance," the financial supervisory departments in various localities have allocated more than 1,900 persons to the job of auditing financial receipts and expenditures from 1979 and enforcing financial and economic discipline.

To sum up and exchange experiences in this connection, and to plan future work, the Ministry of Finance recently held a national financial supervision work conference in Beijing which called on the financial departments in various localities to strengthen their supervision in order to maintain a financial balance for the current year and to check unhealthy tendencies in the economic sphere. The financial departments were also urged to take a serious view of the violations which might jeopardize the financial receipts and expenditures balance, and the cases of seeking revenge by attacking financial and accounting personnel. Such cases must be dealt with severely.

The conference called on all ministries, commissions and other organs directly affiliated to the State Council, and the various bureaus in the provinces and municipalities to act in accordance with the State Council's relevant regulations by setting up financial supervision organs or by including financial supervisors in their personnel. Financial departments at all levels were also urged to keep a sufficient number of supervisory cadres to meet the requirements of financial supervision.

Comrade Zhang Yun [4545 5686], deputy secretary of the Central Commssion for Inspection of Discipline, attended the conference and made an important speech. She called on the committees of inspection of discipline at all levels to support strongly the financial supervisory cadres and the financial and accounting personnel in combating violations of financial and economic discipline and in checking unhealthy tendencies in the economic sphere.

Before the conference adjourned, some leading comrades of the Ministry of Finance also came to give talks and to present summary reports.

FINANCE AND BANKING

NEW DEVELOPMENTS IN CURRENCY CIRCULATION STUDIED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 8, 4 Aug 81 pp 7-8

[Article by Meng Zhaoxia [1322 3507 1115] and Peng Ziqin [1756 1311 0530] of Tianjin Branch of People's Bank of China: "New Conditions and New Changes in Currency Circulation"]

[Text] Along with the deepening of national economic readjustments and restructuring and the implemention of the party's rural economic policies, many new conditions and new elements have emerged in our currency circulation. What are the effects of these new conditions and new elements on the amount of currency required for circulation in the market? Based on recent research on currency circulation, we are of the opinion that the following conditions deserve our attention.

1. The increase of social groups and units, and the greater number of people seeking employment have brought about the need for an increased amount of currency in circulation. These increases along with economic development have made it necessary to increase the amount of cash to be used as operating expenses. According to statistics compiled after an investigation in Tianjin Municipality, the number of units responsible for cash control in the municipality in 1980 increased by 67 percent over that of 1965. Furthermore, because of the continual increase of channels for economic activities and the more flexible scope for the use of cash, the average cash on hand as established by the banks for the units was raised from 250 to 340 yuan, a 36 percent increase. For these two increases alone, an increase of 2.85 million yuan is required for circulation. Also, in view of the huge number of people looking for jobs, the need for increased currency is obvious. In the 15 years since 1965, some 1,391,000 people were added to the work force. The number of persons to be supported in each worker's family in the municipality was reduced from 1.78 in 1965 to 0.48 in 1980. The number of workers and staff members has been sharply increased, and the currency holdings of each new worker are estimated to be 6.36 yuan.

2. The change in the pattern of consumption by residents has led to the need for increased currency. In recent years, consumers have spent more on clothing and daily conveniences and less on food. According to statistics, the proportion of food in the retail sales of consumer goods in the municipality was reduced from 58.8 percent in 1965 to 43.18 percent in 1980, while that of clothing was increased from 12.7 percent to 22.42 percent, and that of daily conveniences was increased

from 28.5 percent to 34.44 percent in the same period. An investigation of the household expenses of 500 workers has revealed that among the 30 items of commodities for household use, electric appliances and garments, bicycles, sewing machines, clocks and watches, TV sets and others of the 10 major items, woolen garments and furniture are now in great deamnd. The demand for high-grade consumer goods is particularly keen among young people preparing to be married. According to a study on newly married couples and young people preparing to be married in Yangu District of Tianjin, each wedding ceremony cost more than 1,500 yuan. In planning of this occasion, each of these young people had to keep on hand 420 yuan--which is 12 times the average holdings of the urban population--for a month or more before the wedding. Based on the number of married couples in 1980 throughout the municipality, namely 115,300, there would be at least 4 million yuan of floating currency in the market.

3. The increase of channels for commodity circulation leads to an increased need for currency in circulation. Speaking of agricultural trade fairs, we now have more than 100 of them in the urban and suburban areas of our municipality, and the volume of their transactions increased from 23.21 million yuan in 1977 to 108.42 million yuan, or 3.1 percent of the total retail sales, in 1980. According to estimates based on investigations, the volume of transactions of agricultural and sideline products in the central district of the municipality in 1980 totaled some 42 million yuan with 11.75 turnovers. A total of 3.4 million yuan was thus required for circulation. The volume of transactions in the trade fairs of the suburban counties reached 67 million yuan with 10.06 turnovers and requiring an amount of 6.6 million yuan for circulation. This shows the very great effects of agricultural trade fairs on currency circulation. Now let us look at the situation of individual industrial and commercial undertakings. In 1977, there were in the municipality only 888 of them; by the end of 1980, the number was increased to 8,544 with a total personnel of 9,653, a total private capital of 1.23 million yuan and business transactions totaling 14.23 million yuan. The number of these undertakings was further increased to 11,106 with a total personal of 12,592 in May 1981. In 1980, individual industrial and commercial undertakings opened 929 bank accounts, which amounted to 10.87 percent of the total number, with an average credit balance of more than 100 yuan. There are 7,615 such undertakings which have not yet opened any bank account, and, based on the calculation from this bank balance, they should be in possession of approximately 760,000 yuan. If we figure an average of 220 yuan for cash holdings, according to a survey on 26 undertakings, then an additional 1.9 million yuan will be required for circulation. Hereafter, the increase of individual undertakings will also increase the amount of currency holdings.

4. The implementation of the party's rural economic policy and the further improvement of the rural economy will require more currency for the market. This requirement is first manifested in the increase of rural communes, production brigades, production teams and work groups following the introduction of the responsibility system in the countryside. According to statistics, the number of production teams in the municipality in 1980 was increased by 1,166, an 8 percent increase. No statistics are available on work groups in the municipality; however, according to a survey conducted in Jinghai County, there are in this county 412 work groups. Based on this figure, it is estimated that there are more than 3,000 work groups in the municipality. More imprest funds are required for additional accounting units. In Jinghai County, each unit possesses an average of not less

than 100 yuan for its own fund for lending, and according to this rate, more than 400,000 yuan are required for the whole municipality.

Secondly, settlement of accounts with cash, which has become more common in the countryside requires a corresponding increase of currency in circulation. In 1980, the total value of procurement for agricultural and sideline products was 420 million yuan, of which 31.8 percent was paid for in cash. Aside from the marked increase of commodities as a result of a diversified economy, the system of production quota for groups and households has increased the channels of sales to the state. There is now a greater need for cash settlement, and for state procurement alone, an additional 1.1 million yuan is required.

Thirdly, the increase of labor power in the countryside has also increased the amount of currency holdings. In 1980, the labor power in the communes and production brigades and teams of the municipality was 42.2 percent more than in 1965. After working for the collective, the vast majority of commune members are engaged in private cattle raising, in weaving and knitting by hand, or in other sideline occupations. The average income for each commune member from the collective was about 155.8 yuan, an increase of 7.4 percent over 1979, and an alltime high. According to surveys conducted on 10 production brigades of the upper, lower and middle categories with regard to household sideline occupation, the average income from the sales of material objects (mainly grain and nonstaple food) for each commune member was 14.02 yuan, a 4.4 percent increase over 1979; from products of private lots and other sideline occupation, 75.28 yuan, a 4.5 percent increase; and 18.37 yuan from wages, bonuses and subsidies, a 43 percent increase. On this basis, an additional amount of 3.8 million yuan in circulation is required.

Fourthly, many peasants are building new houses. According to statistics, 7.4 percent of the peasants in the municipality have built new houses and some 210,000 of them have been, or are being, built. About 80 percent of these houses are built of bricks, and each of these houses costs approximately 770 yuan. In view of the general scaracity of building materials in the countryside, the peasants have to wait some time for these materials and to keep approximately 42 yuan on hand for each house. In the countryside, new houses are usually built during the transition period from spring to summer, especially from March to May. By the yearend, the amount of currency required is usually below the annual average, but still not less than 1 million yuan.

5. The reduction of private hoarding has correspondingly alleviated part of the demand for currency in the market. In 1979 and 1980, the rate of bank interest was constantly raised and savings deposits increased rapidly. The total amount of these deposits is now more than 8 percent of the total payment of wages. According to statistics compiled from a survey on 7 savings centers, approximately 25 percent of the savings deposits came from the "cash drawer bottom." For this, we can deduce that in the past 2 years, the amount of private hoarding was reduced by 22.3 million yuan. At the same time, the hoarding of subsidiary coins has increased. From 1977 to 1980, the municipality withdrew a total of 450 million yuan from circulation, but, in the same period, the total amount of subsidiary coins issued was 2.12 million yuan more than the amount withdrawn; and for every subsidiary coin withdrawn, 2.6 subsidiary coins were issued. In the past 2 years, particularly, the hoarding of coins among young people and children showed a marked increase. According to

to statistics based on a survey on 26 children in the No 7 Kindergarten, 24 of them had personal savings. Out of these 24, 19 students saved a total of 48.06 yuan in coins, averaging 2.33 yuan each; [figures as published] and 30.4 yuan in bank notes of 10-cent denomination, averaging 1.6 yuan each. Apart from this, the 184,000 yuan issued in coins in the municipality were all hoarded. The grand total of subsidiary notes and coins hoarded amounted to 2.3 million yuan.

6. Credit sales have reduced the volume of currency in circulation. Since 1980, credit sales have been on the increase. Credit usually takes one of these two forms: first, in the form of consumer loans granted by the credit and investment company of the bank. This was how 1,905,000 yuan was loaned out to push the sales of 14-inch color TV sets, produced by the 712d Plant. Second, in the form of direct credit sales by the industrial enterprises or through consignment to commercial enterprises. The No 3 Radio Plant has set up a credit system for the sale of 12-inch black and white TV sets of Tianjin brand and has sold 14,000 sets for 5.2 million yuan in this way. It is estimated that credit sales in the municipality will be above 14 million yuan, and this will reduce the volume of currency for circulation by approximately 1 million yuan.

From the above, we can see that many new conditions have emerged in currency circulation in the past 2 years. Some of these conditions call for an increase of currency in circulation; others call for a decrease. We must therefore conduct in-depth investigations to ascertain the actual situation and then carry out a comprehensive analysis before we can reach a correct decision and work out correct currency policies accordingly.

BEIJING MINING BUREAU OVERFULFILLS COAL PRODUCTION PLAN

Beijing BEIJING RIBAO in Chinese 25 Jun 81 p 1

[Article by Yu Fei 0060 7378: "The Leadership Goes Deeply Into the Pits To Command, Greatly Reorganized Labor Discipline; From January to May, the Beijing Mining Bureau Overfulfills Raw Coal Production Plan"]

[Text] The Beijing Mining Bureau has conscientiously changed the style of leadership, reorganized the labor discipline, and from January to May this year, it overfulfilled the raw coal production plan.

As of April this year, the Beijing Mining Bureau's production showed a deficit, and up to the middle 10 days of May, the whole bureau was short over 50,000 tons of raw coal production. The party committee of the bureau made the timely decision to strengthen command at the first line of production in the pits, reorganized labor discipline and strengthened safe production. The party committee secretary and the bureau chief and leading cadres led 57 cadres of the bureau agencies to form a production leadership group which went deeply into 9 mines to ascertain the reason for the production deficit and to solve the problems existing in production. At one time the Datai coal mine had a larger deficit, and the bureau's leadership group studied the problem with the mine leaders and decided to implement the management method of dividing the responsibility of the production sections in the pit. The mine leaders accompanied the three shifts to direct production. By the end of May, this mine completed the raw coal production plan with a surplus of 2,200 tons. The party committee secretaries and chief officers of many mines went into the pits to struggle alongside the workers and strive to produce coal. Each mine exerted efforts to praise the progressive comrades, and at the same time, those who violated labor discipline were severely dealt with. During the last 10 days of May, the Daanshan mine had six workers who falsely reported attendance. After the mine leaders understood the situation, the workers were severely dealt with individually. By the end of May, this bureau not only pulled itself out of its deficit, but it completed the raw coal production plan for the period from January to May with a surplus of 699 tons. While assuring the completion of the production task, it also took measures to actively carry out reorganization. Since the beginning of June, the production of this bureau has continued to increase, and by 23 June the entire bureau produced 4,000 tons more raw coal than planned.

ENERGY

DATONG BUREAU USES MECHANIZED COAL EXTRACTION TECHNOLOGY

Beijing GUANGMING RIBAO in Chinese 10 Jul 81 p 1

[Report by reporter Sun Xinde [1327 2450 1795] and correspondents Wang Rongping [3769 2837 1627] and Ma Yuxiang [7456 3768 4382]: "Datong Mining Bureau Suits Measures to Local Circumstances, Develops Comprehensive Mechanized Coal Extraction Technology and Achieves Noticeable Results"]

[Text] In recent years, our nation's largest coal production base, the Datong Mining Bureau in Shanxi Province, suiting measures to local circumstances, has actively developed a new comprehensive mechanized coal extraction technology and has achieved noticeable results. In 1980, the entire bureau's production of coal by mechanized extraction constituted 39 percent of the extraction production, whereas in the first quarter of this year the percentage reached 48 percent.

Comprehensive mechanized coal extraction is an advanced coal extraction technology developed internationally in the 1950's and 1960's. It involves the use of a system of facilities to extract, load and transport coal, support the mine shaft and control the roof plates in the mine shaft, and similar work procedures to carry out comprehensive mechanized production. The Datong coalfields have a rich reserve located at a shallow depth, the geological structure is simple, and the coal layer reserves are level, so they are suited for using this new technology. The bureau cooperated with the Taiyuan Coal Institute of the Coal Sciences Institute and successfully developed a mobile support for hydraulic pressure extraction of the thin coal layer in the Datong coalfields after 4 years of research and development for use in production. Later, they went on to develop a fixed model and put into production many types of buttress hydraulic pressure mobile supports suitable for the Datong coalfields. At the same time, the state also adopted some comprehensive extraction facilities introduced to the bureau from abroad and they served importantly in production. At present, the bureau has 28 comprehensive extraction teams which have successfully experimented and popularized the new technology of comprehensive extraction in 14 exploitable coalbeds.

The efforts of the Datong Mining Bureau to develop comprehensive mechanized extraction of coal has brought about five welcome changes for this large-scale coal production base:

1. The yield and the efficiency have been increased. Last year, the entire bureau's production increased 4.28 million tons over that before employing comprehensive mechanized extraction. The average monthly production of comprehensive extraction was 3.4 times that using ordinary mechanized extraction of coal and 2.46 times that of blast mining. The efficiency of extraction is 2.5 times that of ordinary extraction and blast mining.

2. Safety is good and fewer injuries occur. The upper part of the Datong coalfields belong to the Jurassic period: the coal is hard, the top plate is hard, metal and wooden supports for the top plates do not completely satisfy the requirements, and top plate accidents occur easily. Now, the comprehensive extraction facilities include a high-tonnage strong metallic mobile hydralic pressure support for the top plate, the injection of water, and similar other technical measures, so the safety is greatly increased. For several years, comprehensive extraction has eliminated death due to accidents caused by the collapse of the top plates.

3. The retrieval rate of coal resources has been increased. In 1980, the entire bureau worked 16 new comprehensive extraction sites: the retrieval rate at the sites reached 71.59 percent, an increase of 5.41 percent over that of 1979, and over 2 million tons more of coal were retrieved.

4. The scope of coal extraction has widened, the direction has lengthened, and the amount of work involved in digging tunnels and alleys required to produce the same quantity of coal has been reduced. According to statistics, in 1980 the entire bureau dug 42,000 meters less tunnels and alleys using comprehensive extraction.

BEIJING NOTICE ORDERS STRONGER CONTROL OVER BOTTLED GAS

Beijing BEIJING RIBAO in Chinese 12 Jun 81 p 1

[Article: "Strengthen Control of Civilian Liquid Gas, Carry Out the Work of Planned Supply Well; City Government Notice Orders a Halt to Blind Production and Sale of Steel Bottles of Liquid Gas"]

[Text] The city government recently issued a notice ordering stronger control over civilian liquid petroleum gas and a halt to blind production and sale of steel bottles of liquid petroleum gas, calling on concerned departments to enforce implementation of the order.

Since last year, civilian liquid petroleum gas in the city has been in short supply, the gap between demand and supply has become wider and wider. To cope with this, many ways must be used to increase the source of gas, and on the other hand, control must be strengthened in order to carry out the work of planned supply well. But at present, the units that produce steel bottles of liquid petroleum gas in the city have increased in number, and steel bottles of gas are even being sold on the agricultural and commercial markets. This disregard for the condition of resources and blind production and sale of steel bottles of gas have destroyed the planned supply of liquid petroleum gas, throwing the amount of sales out of control and intensifying the supply shortage.

To carry out the work of planned supply of liquid gas well and to strengthen control over civilian liquid petroleum gas, the city government has ordered:

1. All steel bottles of liquid petroleum gas for civilian use in the city of Beijing are to be manufactured under assignment by the Beijing City Gas Utensils Plant; other plants and units are not allowed to produce any further bottles.

2. All steel bottles of liquid petroleum gas for civilian use in the city of Beijing must be uniformly managed and sold by the city gas company and must carry the label of the city gas company. Other units or individuals are prohibited from dealing in or selling steel bottles of liquid petroleum gas. The steel bottles produced by the city gas utensils plant and used in the city are sold under contract by the city gas company. The gas utensils plant cannot sell them in the city in any way.

3. The city's liquid petroleum gas users will be uniformly dealt with and developed by the city gas company in accordance with the conditions of petroleum resources. No units or individuals are allowed to purchase steel bottles of gas elsewhere or use other illegal means to increase users or to purchase liquid petroleum gas in the city.

4. The city gas company must conscientiously strengthen control over the supply of liquid petroleum gas and strictly control the blind increase in the number of users of liquid petroleum gas. Users that do not have the capital or that borrow capital to purchase gas and users that use steel bottles of purchased gas without the label of the gas company will not be supplied.

The supply to autonomous users, industrial, scientific research and other users must be limited. Shipment of liquid petroleum gas to other places is strictly prohibited. The city gas company must conscientiously investigate and halt the supply to users in other regions. Units or individuals located in Beijing are not allowed to purchase gas in Beijing for any outside units or users in any way.

5. The city public utilities bureau and its subordinate gas company and the city coal company must join together to strengthen the leadership of the supply and marketing stations of liquid petroleum gas, improve management and control, improve the quality of service, and strictly carry out the above regulations.

6. The responsible persons of units violating the regulations will be given the necessary discipline by the superior departments according to the situation.

'JINGJI GUANLI' ON SHANDONG COTTON OUTPUT

HK030920 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 7, 15 Jul 81 pp 14-16

[Article by Zhong Yi [0022 3015]: "What Is the Significance of the Great Increase in Cotton Output in Shandong?"--slantlines denote boldface]

[Text] In 1980, Shandong Province witnessed a great increase in cotton output. The unit output of ginned cotton of the province reached 97 jin per mu, an increase of 56 jin per mu over 1979. This figure far surpassed the national average output level. A great number of typical examples of high output have emerged throughout the province and there are 30-odd counties with an average output of over 100 jin per mu. For example, Guan County attained an average output of 132 jin, Yanggu County 137 jin, Wenshang County 150 jin. The total cotton output of the province exceeded 10 million dan for the first time, in other words, the output increased by 7.40 million dan over 1979, an increase of 2.2 times. A level and growth margin of cotton output per unit area such as that achieved in the province last year has not been witnessed since the founding of the People's Republic.

Due to the good harvest of cotton, the province supplied the state with a large amount of commodity cotton. The total amount of commodity cotton sold to the state by all communes and brigades throughout the province in 1980 exceeded 10 million dan, which surpasses the total sold in the 3 years of 1977, 1978 and 1979, and is more than double the highest annual output in history. The average amount of ginned cotton sold by each cotton producer to the state was 42 jin last year. In Liaocheng, one of the key cotton-producing regions, every cotton producer, on the average, sold 85 jin of cotton to the state. In Linqing County it was 106 jin. Based on a rough calculation, with the yarn spun from the increased 7.40 million dan of cotton, about 2.1 billion meters of cloth can be produced; that is to say, for every person in our country there is an extra 6 plus chi of cloth. This has not only vigorously assisted the development of the textile industry enabling it to produce more cotton fabrics to fulfill the needs of the people, but also helped a lot in activating the market, withdrawing currency from circulation, and increasing the state's financial income.

Due to the good harvest of cotton, collective and personal incomes doubled last year. In 1980, the income from the cotton production of the province reached 2.4 billion yuan, an increase of nearly 1.7 billion yuan over 1979. Every cotton producer's income increased by an average 70 yuan. Some backward regions, in particular, the key cotton-producing regions in the north western part of Shandong Province, have begun to undergo gratifying changes because of the all-round good harvest of cotton last year. The revenue from cotton production in the four cotton-producing regions of Huimin, Dezhou, Liaocheng and Heze amounted to 1.8 billion yuan, and accounted for more than 80 percent of the total agricultural revenue. The revenue from cotton production in Liaocheng region, which is the cotton-producing center of the province, amounted to 680 million yuan last year, and exceeded the total agricultural revenue of the year before. Hence, the fund used for collective accumulation and production has more than doubled. In the three cotton-producing regions of Liaoching, Dezhou and Heze, there were 940,000 households, about one-fourth of the total number of farm households, whose income exceeded 500 yuan. The revenue from cotton production of Wenshang County exceeded 100 million yuan last year, an increase of 3.8 times over the year before and this accounted for 67 percent of the total agricultural revenue. And the commune members of this county had an average per capita income of 284 yuan. The revenue from cotton production of Linqing County was 116 million yuan last year. There were 27,000 households, 24.5 percent of the total number of farm households, whose income exceeded 1,000 yuan. The Fengquan production team of the Yandian commune in this county is a well-known "barren land" where only weeds thrive, and the average cotton output was merely 2.8 jin per mu in 1977. This team also achieved a tremendously good harvest in 1980. The average output reached 140 jin per mu and the income of every member rose to 146 yuan in contrast with the 51 yuan of the year before.

The reasons why Shandong achieved such a big increase in cotton output are varied. The main reasons can be summed up in four points: correct policies, a scientific attitude, the people's efforts and a favorable climate.

1. /The conscientious enforcement of the policy./ In the last few years, the cotton output of the province has been fluctuating around 3 million dan or so, much lower than the record level. What were the actual reasons? According to the investigation, one of the most important reasons was that the problem concerning the grain ration for cotton producers has not yet been solved. Besides, the income gained from cotton producing remained low, the rewards did not match work and both these factors caused problems as well. To deal with these problems, the provincial authorities last year further carried out the whole series of guidelines and policies initiated by the central authorities concerning the promotion of cotton production. A policy of linking grain ration to cotton production has been carried out throughout the province. According to this policy, the grain ration for cotton producers is calculated in basic accounting units. Everyone who provides the state with 10 jin of ginned cotton can get a grain ration of not less than 365 jin; if providing more than 10 jin, every extra jin of ginned cotton will be rewarded with 1.5 jin of grain; everyone who provinces 20 jin of ginned cotton will be assured of a grain ration of 380 jin; those who provide more than 20 jin will get 4 jin of grain or 2 jin of chemical fertilizer for each extra jin of ginned cotton. Thus the grain ration can be increased to as much as 600 jin. In order to win the people's confidence, the provincial authorities set aside more than 500 million jin of grain at the beginning of last year to be used in implementing the policy. Under such a policy, the cotton producers' grain ration is ensured; and on the other hand, the more cotton produced, the more grain received. Thus the problem concerning the grain ration for the broad masses of cotton producers has been solved fairly.

In the meantime, as the purchasing price for cotton has been raised and the production responsibility system of linking remuneration to output has been adopted, the situation of low returns for cotton producing has been changed and the egalitarian practices in distribution have been properly overcome. The cotton producers' enthusiasm for production was vigorously mobilized as soon as these policies were put into effect. Last year, besides actively promoting cotton producing, many communes and brigades even reallocated plots for cotton producing--some fertile plots and even quite a few private plots have been used for cotton producing.

2. /The enforcement of "five fixes and one reward"--multiform job responsibility system of linking remuneration to output./ The "five fixes and one reward" means: Fix the plot, fix the labor, fix the output, fix the cost, fix the remuneration; and reward overproduction. The so-called multiform job responsibility system means the coexistence of three forms: fixing output quotas on a group basis for some cases, on a household basis for some others and on an able-bodied person basis for the rest. No matter which form is adopted, all things must be done under the prerequisite of "three upholds" (uphold the public ownership of the means of production, uphold the accounting system in which the basic accounting unit is the production team, uphold the principle of distribution according to work) and "five unifieds" (unified leadership, unified planning, unified plowing, unified irrigation and unified distribution). In order to carry out the policy of the "five fixes and one reward," contracts for production and purchase were signed at all levels--the province, the region, the county, the commune, the brigade and the production team--and job contracts on rewards and punishments were signed between the team and commune members. All these activities have played an essential role in improving the administration of cotton producing and raising the cotton output.

According to reports from different places, the enforcement of the "five fixes and one reward" production responsibility system of linking remuneration to output has brought about a few great changes. The first change is the raising of the production consciousness of commune members. In the past, people used to reluctantly go to work only after earnest urging by team leaders, and always loafed around the fields. Now they go to work without being urged and work from dawn to dusk, striving for a high yield. The second change is the meticulosity of field management. In the past, the management was a mere formality to deceive higher authorities. Now, intensive and meticulous farming and stressing practical results has become a common practice. Take sowing for example. Now people process seed by seed, strip by strip, and work very carefully to save all seedlings, just like they do when planting melons. The third change is the raising of the land utilization ratio. In the past, people used to leave a wide margin around cottonfields, and gaps could always be found in strips. Today, people make use of every inch of land and save even a single seedling. The fourth chage is the advocating of scientific cotton producing. In the past, people used to grow cotton in a traditional way and rejected any scientific developments. Now, as they are always concerned with the output, they do not hesitate at all to try improved varieties and new techniques. The merit of the "five fixes and one reward" job responsibility system of linking remuneration to output lies in the principle of distribution according to work. It negates the rrational practices of egalitarian distribution, and really links the results of the producer's labor to his material interest. In the words of the masses, linking remuneration to output is like linking our mind to it; whoever is involved will be concerned with production; now we go to work without a call by a whistle or bell, without being urged by the production team leader; intensive and meticulous farming boosts the output; the principle of more remuneration for more work encourages us to work hard.

3. /The rational readjustment of the internal structure of agriculture./ As one of the important cotton-producing areas of the country, Shandong possesses all the advantages for cotton producing. There are long hours of sunlight; the broad masses of people have a tradition of cotton producing, a rich store of planting techniques and experiences, a number of examples of high production have occurred before in the province, and so forth. However, for many years, the production of cotton was always squeezed out by that of grain because of the one-sided emphasis on the guideline of "taking grain as the key link." Proceeding from reality, last year the provincial authorities adopted the principle of taking cotton producing as the main task while giving due consideration to the production of grain and other crops, and carried out a reasonable readjustment of the proportionate relation between grain and cotton. After the reallocation, the cottonfield area has been increased from 8.14 million mu in 1979 to 11.05 million mu in 1980, an increase of 2.91 million mu. The focus of readjustment was put on the four regions of Liaocheng, Dezhou, Huimin and Heze. The increase in cotton producing area in these four key cotton-producing regions accounted for more than 80 percent of the total increase in the whole province. After the reallocation, the proportion of cotton-producing area to the total area of cultivated land has attained a record level. In the meantime, according to the principle of rational allocation and proper concentration the provincial authorities have set up 61 commodity cotton-producing counties instead of the 65 in 1979, of which 28 counties each possess more than 200,000 mu of cottonfields, in contrast with 14 counties in 1979. Most of the cotton-producing communes and brigades have also reallocated the plots. According to incomplete statistics, 2 million mu of cottonfields have been transformed from poor land into fertile land. The readjustment of the internal structure of agriculture and the regional reallocation helped to develop strong points and avoid shortcomings, enabled the favorable natural and technical conditions to be rationally employed, and created the important conditions for an increase in cotton output.

4. /Scientific cotton producing./ There is an outstanding problem in cotton production. When seedlings come out late in the initial stage, the cotton plants boom in the middle stage, and the cotton bolls ripen late in the final stage. Tall cotton plants will shed cotton at all stages and eventually grow big but empty bolls. In such a case, although there are a lot of bolls, the harvest is usually poor. In order to avoid this, the authorities have extensively carried out the following effective measures. First, they have actively popularized the improved cotton variety of "Lumian No 1." This variety has high resistance, short maturity period, and high boll-forming rate, and grow a large quantity of big bolls which blossom in a concentrated way, resulting in high yields which are over 20 percent higher than the local varieties. It was popularized in 80 percent of the cottonfields throughout the province last year. Second, they have paid much attention to the basic facilities. Just to name the major ones, they have extensively taken care of irrigation in winter and spring to preserve the moisture of the soil, dug irrigation ditches and ditches for reducing the alkalinity of the soil, applied phosphate and cake fertilizer, engaged in timely sowing, intertillage and soil loosening, timely treating of seedlings, and so on. Therefore, the seedlings in

most of the cottonfields were saved and grew healthily. Third, they have vigorously promoted the prevention and cure of insect pests. Fourth, the cottonfield management has been strengthened. In the past, "whenever the harvest of wheat began, cotton seedlings would shrink like a fist;" and "as soon as the sowing of wheat started, nobody would take care of cotton anymore." Such a situation basically changed last year. People completed the field maintenance work such as hoeing fields, eliminating damaging insects, topdressing, soil loosening, pruning, and so on in time. Most of the cotton producing teams managed to ensure their fields were free of weeds, insect pests and hardened and impervious soil. The phenomenon of early aging due to shortage of fertilizer has been greatly changed.

5. /The solid improvement of the leadership in cotton producing./ Leadership is the key link in raising cotton production. In order to strengthen leadership the first important thing is to pay attention to the enforcement of guidelines and policies. The Provincial Party Committee and the provincial government convened a few conferences on cotton producing last year. They reiterated the policies in "the decisions concerning the speeding up of cotton production," and saw that all of them were concretely carried out. Second, many leading groups have been set up in those regions, counties, and communes in the cotton-producing centers, and cotton production was raised to an important position and grasped as a key task. The third thing is to spread experience from one point to the whole area. The authorities concerned have summed up the typical experiences of the key cotton-producing regions and spread the information to other places to instruct these areas in production. The fourth thing is to promote technical instruction. Technical advisory groups have been formed at the provincial level and in all key cotton-producing regions. These advisory groups have provided technical guiding suggestions relating to the different farming seasons. Organizing training classes and fostering a great number of technical cadre, the authorities have brought fully into play scientific and technological personnel. Finally, they have organized production and circulation departments in a unified way and made them coordinate closely in supporting cotton production.

Apart from all the above factors, "nature" also contributed. As there were few cloudy and drizzly days and sunshine was abundant in the blossom period of last year in the province, bolls did not shed a lot. The high temperature and the late arrival of the frost season also helped a lot in boll maturing and opening. These were really favorable climatic conditions for a good cotton harvest.

What is the significance of the experiences of Shandong in achieving a good cotton harvest? It has demonstrated two "very bigs." For one thing, the power of policies is very big indeed. Over the past years, because the policies were wrong, the initative of cotton producers was not mobilized and the output remained low. Now, as the correct policies have been carried out well, the cotton producers have found their prospects bright, production has been raised and the people's livelihood greatly improved. Based on experience in leading agricultural production over many years, the party's central authorities have formulated a guideline for the future--to develop agricultural production, we must rely on policies, science and the strengthening of the responsibility of peasants. The practices in Shandong have proved once again that this guideline by the central authorities which conforms with the actual circumstances of agricultural production in our country is correct. Then, will the production increase spontaneously with the correct guideline and policies? Not necessarily. It depends on whether the policies are solidly and well carried out. In fact, there are still plenty of places and units where the production remains as low as before because the policies have not been solidly carried out. The authorities concerned in Shandong have seized the key to the problem. Regarding the enforcement of relevant policies as important work, they were really determined, their speeches inspired confidence and the measures they took were effective. As they have upheld the policies all the way, it has resulted in good effects. As to the other thing, the latent power for increasing output is very big indeed. The output of 1 mu increased by a few 10's of jin and the total output more than doubled. This fact has proved that low yield can be turned to high yield and new production levels can be attained only if the initiative of man is mobilized and the latent power for increasing output is brought into play. If we broaden our outlook from Shandong to the whole country, we find that the cotton production in many provinces, cities and regions also achieved good results last year, and the whole country's cotton output increased by more than 20 percent. Nevertheless, it should be noticed that the output per mu in some key cotton-producing provinces is still far below that of Shandong. And in particular, there are still one-fifth of the cottonfields throughout the country on which the output is below 50 jin per mu. This shows that the cotton production in our country still has considerable latent power. If other regions can conscienciously learn from the Shandong experience, develop their own strong points, avoid the shortcomings, and give full play to their dominance, they will surely be able to achieve a fair increase in cotton output in their own regions. This is definitely possible and the conditions do exist.

There is one more question to discuss. Should the development of the cotton production depend on expanding cottonfield area or on raising the output per mu in the future? In our opinion, from the national view, it should depend on raising the unit output because our country has an enormous population yet little cultivated land, and the grain production level is still low. The key cotton-producing provinces should further readjust the allocation rationally, give better play to the dominance of cotton production with the prerequisite that the stable growth of grain production is ensured. In provinces where the areas of cottonfield has already attained record levels, these cottonfield areas should not be expanded any more; our aim is to maintain a proper relationship between grain and cotton, so as to stress the production of grain with that of cotton and ensure the production of cotton with that of grain.

INCREASED PURCHASING POWER, PROSPEROUS MARKET REPORTED

Guangzhou GUANGZHOU RIBAO in Chinese 18 Jul 81 p 1

[Article by correspondents Wu Mingxian [0702 2494 0341] and Shi Caibai [2457 2088 4101]: "Increased Purchasing Power and Flourishing Market--Guangzhou Market Busy in Usually Slack Seasons; Purchasing Power Greatly Increased in Countryside; High-Grade and Brand Name Commodities Selling Well; and Commercial Structure Beginning to Change"]

[Text] Since the beginning of this year, the market in our municipality has enjoyed such prosperity as has rarely been seen since the liberation. The total commodity procurement, the net sales, retail sales, state revenues, people's savings deposits in both urban and rural areas, and the withdrawal of currency from circulation have all increased by wide margins. The situation is gratifying.

Since the beginning of this year, the market here has witnessed four special conditions:

1. Business is as usual even in slack seasons, but is even more flourishing in busy seasons. Even after the usually busy seasons of New Year and the spring festival, the market still remains as busy as ever. The sale of industrial goods for daily use in the municipality has always been brisk, and in the first 5 months of this year, the total volume of commodity sales was more than 570 million yuan, an increase of 14.4 percent over the same period in the previous year. According to statistics compiled on 21 main varieties of industrial goods for daily use, sales have increased for 12 of them including TV sets, tape recorders, leather shoes and floor fans. At present, apart from cotton cloth--which has to be rationed according to government regulations--and sewing machines and bicycles manufactured in Shanghai for which supply does not meet demand, there is now an abundance of industrial goods for daily use. The supply of nonstaple food has become more plentiful. From January to May, pork, poultry, eggs and fish sold in the market totaled more than 145 million jin, and each person in the urban area had an average of 14 jin each month.

2. There has been a greater increase of purchasing power in rural than in urban areas. From January to May 1981, the sale of nonstaple food in the city area (including the suburbs and Huangpu District) was 8.3 percent more than the same period in 1980, while sale of the same item in the 6 counties under the jurisdiction of Guangzhou increased by 15.3 percent. The sales of industrial goods for daily use in the first 5 months of this year increased by 15.1 percent over the same period of last year, while the sales of the same items in the subrubs of

Guangzhou, Huangpu District and the same 6 counties showed an increase of 17.1 percent. In the first 5 months of this year, again, people's savings deposits in the city area increased by 52.8 percent over the same period of last year, while the savings deposits of commune members in the 6 counties increased by 81.6 percent.

3. People's money is being spent more on high-grade or brand name goods or novelties. Because of the general increase of income for people in the urban and rural areas, their consumption level has been raised, and they are more selective in their purchases. In the first 5 months of this year, the number of TV sets, tape recorders and floor fans sold in the municipality exceeded that of the same period in 1980 by 3 to 7 times. According to the statistics of Nanfang Daxia Department Store, 331 refrigerators, 318 washing machines and 2,994 electric rice cookers were sold here in the first 5 months of this year. High-class wooden and and metal furniture is also being sold fast, and in the first 5 months of this year, the volume of sales exceeded that of the same period in 1980 by 13 and 20 percent respectively. For clothing, more chemical fiber materials and garments were sold than cotton cloth and garments in the municipality.

4. There has been a marked change in the commercial structure, along with the gradual return and development of many economic sectors and the increase of circulation channels and forms of transactions. Commercial transactions are now more flexible than before. Since the beginning of this year, many trades and undertakings have provided commercial services according to social needs. This has broken the monopoly long enjoyed by state-run commerce in the past, and a new spectacle of mutual competition among various economic sectors has appeared. At the same time, under the guidance of planned regulation, market regulation is now playing a more active role, and negotiated transactions outside the plan are serving as a means to make up for the shortage of commodities. The market is now more enlivened. In the first 5 months of this year, the total volume of transactions at the trade fairs in the municipality exceeded 125 million yuan, an increase of more than 50 percent over the same period of last year.

DIVERSION OF 'THREE WASTES' PROGRAM FUNDS REPORTED

Beijing Battery Plant

Beijing BEIJING RIBAO in Chinese 15 Jul 81 p 1

[Article: "Battery Plant Diverts 'Three Wastes' Special Management Funds To Build Office Building; Management Projects That Should Have Been Completed Last Year Have Not Been Completed yet"]

[Text] Reporter of this paper Liu Tingzhao [0491 7200 2507] reports: the Beijing City Battery Plant disregarded concerned regulations of the higher authorities and diverted 80,000 yuan of special "three wastes" management funds for other uses; thus, the "three wastes" management projects which should have been completed last year have not been completed yet.

For a long time, the city battery plant's waste water and waste gas had a higher mercury content than the state standard, seriously harming the health of the workers and the surrounding masses. To eliminate pollution of the environment by this plant and to provide experience for the nation's battery producers in the management of the "three wastes," the state's Light Industry Ministry gave the city battery plant 200,000 yuan of special funds at the end of the year before last and ordered the plant to complete the task of managing the gas and water containing mercury in 1980.

According to the demands of the higher authorities, 120,000 yuan of the special funds were to be used for civil engineering construction of a battery liquid shop and the other 80,000 yuan were to be used for the purchase and installation of mercury treatment facilities. However, the responsible comrades of the plant disregarded the regulation of the higher authority stipulating that "special 'three wastes' management funds must be used for that purpose," and they used the 80,000 yuan of special funds for mercury treatment on constructing the plant production office building. After more than a year, the 200,000 yuan were spent, the production office building of the battery plant was handed over for use, but the treatment tasks ordered by the higher authorities were not completed yet. Although the civil engineering construction part of the battery liquid shop has been completed, the mercury treatment facility has not been started, and poisonous water and gas are still being released. When the higher authorities inquired about the treatment situation, they were told: "We do not have any more money." At the beginning of this year, that plant again requested special mercury treatment funds of 80,000 yuan from the city's financial committee, and it is estimated that the waste gas and wastewater treatment projects will be completed at the end of this year.

The concerned departments of the city's First Light Industry Bureau approved the battery plant's diversion of the special "three wastes" treatment funds on its own without approval from the responsible bureau chief and the Ministry of Light Industry, and it should also be held responsible. It is worth mentioning that the city battery plant did not conscientiously investigate the mistake of diverting special funds and correct the use in time, but tried hard to explain it away and digressed from the main issue. The Ministry of Light Industry and the Environmental Protection Bureau have offered serious criticism and have demanded that the debt for the treatment of the "three wastes" be repaid right away.

Criticism of Diversion

Beijing BEIJING RIBAO in Chinese 15 Jul 81 p 1

[Article: "Diverting Special 'Three Wastes' Management Funds Is Not Allowed"]

[Text] Diverting "three wastes" management funds has occurred many times recently and we must pay attention to this.

The debts of "three wastes" management incurred by some units have not been repaid. One reason given is: "We have no money." Yet, in fact, at some units, the special funds appropriated by the state for "three wastes" management have become capital construction funds for building production office buildings, repairing asphalt roads and beautifying the plants. This phenomenon shows that the leaders of these units do not care about environmental protection. In the eyes of these comrades, environmental protection work is not necessary, and in arranging work it is pushed out of the way or abandoned whenever possible. This way of thinking and acting are contrary to the demands of the directives of the party and government and the masses of people. They are completely wrong. We sincerely hope that the comrades who think and act this way will increase their understanding, correct their attitude and strengthen their discipline through discussion of "serving the people and being responsible to the people" to conscientiously grasp environmental protection work well. The special funds appropriated by the higher authorities must be assured of being used in the treatment of the "three wastes." It must not be diverted at will. Each leading agency must also strengthen supervision and examination of the subordinate enterprises to stimulate them to conscientiously implement the measures of managing the "three wastes" and concretely use special funds for special purposes. At those units that violate the directives of the higher authorities and divert the special funds for "three wastes" management at will, their leaders should be subjected to criticism and education and they should be ordered to make improvements within a specified time. The necessary treatment should be carried out when the situation is serious.

GENERAL

NEED FOR RESPONSIBILITY SYSTEM IN FINANCE, TRADE STRESSED

Kunming YUNNAN RIBAO in Chinese 19 Jul 81 p 1

[Article by correspondent Gong Zongsui [7895 1350 6659]: "System of Responsibility for Business Must Be Practiced by Finance and Trade Enterprises--Provincial Finance and Trade Department Called on all Localities Actively To Promote Responsibility System by Proceeding from Realities"]

[Text] The leading comrades of the Finance and Trade Department under the Yunnan Provincial CCP Committee recently led a number of work teams to Qujing and Zhaotong, where they conducted investigations on conditions for adopting the responsibility system in various forms among the finance and trade enterprises at the basic levels. After summing up their experiences, they called on various localities to proceed from realities and adapt the measures to local conditions in order to popularize the responsibility system.

Since the second half of 1980, many finance and trade enterprises at the basic levels have adhered to the principle "to each according to his ability" in order to change the old practice of "eating out of the same pot," and to further arouse the enthusiasm of workers and staff members. In the experiments in expanding the decision-making power of enterprises, they learned from the experiences of the system of responsibility for production in agriculture, and tried out various forms of the system of job responsibility and economic responsibility. According to their investigations, this system mainly took the following forms: responsibility for a set profit quota, sharing above-quota profits and bearing all losses; receiving rewards for profits and paying compensation for losses; fixed quota for work and production with work groups held accountable for business results and eligible for quota-fulfillment rewards; fixed levels for losses among some enterprises and sharing of savings if losses are kept below the allowed level; people engaged in diversified economy to be evaluated according to their production and their commune affilitation; job responsibility for everyone engaged in tax collection and food procurement; and four others.

Adoption of the responsibility system aroused the enthusiasm of workers and staff members of the enterprises. Instead of waiting for customers to call on them, they are now making door-to-door deliveries; and instead of sitting behind the counters of procurement centers, they are now going down to the countryside. Late opening and early closing are now replaced by early opening and late closing. There has been a marked improvement in their service, accompanied by increased sales and profits and reduced expenditures. The People's Restaurant under the Qujing County Food Company has four branches with 105 employees. In practicing the responsibility system of receiving rewards for profits and paying compensation for losses, every employee has a sense of responsibility for fulfilling the four quotas (for volume of business transactions, expenditures, gross profits and net profits). Their work performance is reviewed at the end of each month and they will receive rewards or penalties according to the result. These measures have produced good economic results. Since the introduction in March of the responsibility system, this restaurant has fulfilled its quota every month, and its business transactions and profits have increased by 25 and 47.3 percent respectively over those of the same period in 1980. In Sayu Supply and Marketing Cooperative of Zhaotong County, formerly there was no clear definition of job responsibility and its system of operation was not strictly enforced resulting in frequent cash shortages. Early this year, the system of fixed quota was introduced among its 8 procurment and marketing centers and 11 retail stores, and evey counter and work group were held accountable for their business results. They would, however, be rewarded for fulfilling their production quota. Since then, they have not only overfulfilled their assigned duties of procurement and marketing but also improved their methods of accounting. By keeping careful records of all transactions and inventories, with all discovered shortages to be made up by the persons concerned, they made only one wrong entry in their books throughout the first 5 months of this year.

To promote the experiment of the responsibility system among finance and trade units, the Finance and Trade Department under the Provincial Party Committee recently held a conference attended by responsible comrades of various bureaus on the finance and trade front. After listening to the reports by the work teams, everyone realized that the system of responsibility was a good way to promote circulation, to improve business management and to raise the quality of services, and should therefore be promoted. They also felt the need to further emancipate the mind, provide more active leadership, sum up and popularize the experiences, and adapt their measures to local conditions in order for this system to be popularized.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

PARTY'S LEADERSHIP OVER ENTERPRISES

HK090905 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 7, 15 Jul 81
pp 3-7

[Article by Jin Guangwen [7246 1639 2429]: "Strengthen and Improve the Party's Leadership Over Enterprises"--passages within slantlines denote boldface as published]

[Text] The great Chinese Communist Party has just celebrated its 60th anniversary.

Under the leadership of the party, the Chinese people have over the past half a century and more waged tortuous and arduous struggles, finally defeated vicious internal and external enemies one after another and won historical victories for the new democratic revolution and socialist revolution to pioneer the great cause of socialist construction. Under the leadership of the party, we have smashed the counterrevolutionary cliques of Lin Biao and the "gang of four," saved the country and revolution and begun a new historical period of the socialist construction that is aimed at realizing the four modernizations. The experiences in the course of revolution and construction have proved that the Chinese Communist Party is the leading core of the whole Chinese people as well as the mainstay of the Chinese revolution and construction. Without the party, there would be neither new China nor modern China.

It is our general task for a long time to come to realize the four modernizations. It is unimaginable to build our country into a powerful socialist country without the leadership of the party that is representing the interests of the people and that is in a position to unite the people of various nationalities in their fight.

But because the party's good tradition and work style have been seriously spoiled by the sabotage of the "gang of four" during the 10 chaotic years, because of the defects in the party's system of leadership and because the new historical period has set new tasks and demands on the party, it is imperative to strengthen and improve the party's leadership. Comrade Deng Xiaoping said that we are facing a big problem of how to improve the party's leadership, and if we do not study and solve this problem, we will not be able to uphold the party's leadership and prestige. He also said that in order to improve the party's leadership it is imperative to improve the current leadership work of the party and rectify the party's leadership system that includes the leadership system over enterprises.

The leadership system of our enterprises has experienced constant development and change. Prior to the founding of new China, some state-owned enterprises in base areas resisting Japanese aggression and liberated areas implemented a factory director responsibility system under collective leadership. That is to say, the important matters of the enterprises were decided by "three-member teams" that were composed of the party branch secretary, the factory director and the head of the trade union or factory management committee, while the factory manager was responsible for daily production and administrative work. This system accorded with the situation during war time and with that of small-scale enterprises and simple production.

Following the nationwide liberation, we confiscated large enterprises. Some state-owned enterprises introduced the party committee system and the enterprises were directly under the management of the committee. Other factories implemented the factory director responsibility system, with a unified command for both production and administration so as to meet the objective need of socialized mass production. Still other enterprises implemented democratic management system by factory management committee and workers' congresses while the party organizations were responsible for guiding ideological and political work in factories and mines. Beneficial experiences were gained from trial implementation of these systems but there were also some problems. In 1953, some enterprises introduced the "system of one-man leadership," but it resulted in weakening the party's leadership and the staff's democratic management. The Eighth Party Congress that was convened in 1956 officially decided that the workers' congress system and factory director responsibility system under the leadership of the party committee be implemented in enterprises. It must be affirmed that these systems played a positive role in strengthening the party's leadership and workers' democratic management. But they had the major weak point of confusing the party's leadership with workers' democratic management. Both the "unified leadership of the party" and the "first secretary in command" were one-sidedly stressed in carrying out these systems, administrative powers were totally centralized in the hands of the party organizations, and all matters had to be discussed by the party committee and approved by the party secretary. Consequently, people thought that realizing party leadership meant that the party had to take care of everything. Other people even thought that party leadership meant that everything had to be approved by the party secretary. Practice proved that, by confusing party work with administrative work, the broad masses of the people were not able to fully display their role as the masters of the country, and this confusion was not beneficial to establishing and perfecting the responsibility system of production and technology and unified command in production and administration. More important was that with such a system, the political party, which is the vanguard of the proletariat, was downgraded to an administrative organization as well as to a direct manager of economic activities in production and technology of enterprises. As a result, the tendency for the party not to care about its own work emerged. In fact, the party's ideological and political leadership in enterprises was weakened.

The 3d Plenary Session of the 11th Party Central Committee pointed out that the leadership system must overcome confusing the party's work with administrative work. Now the party and state leadership system is being reformed according to the principle of separating party and administrative work. The restructuring of the leadership system of enterprises must also overcome shortcomings such as confusing the party's work with administrative work, confusing the party's work with that of enterprises, the party replacing administration and the party not caring about the party's work itself. The reform must be carried out according to the principle of separating party and administrative work so that the party organizations in enterprises will be freed from administrative affairs to engage in guiding ideological and political work.

In his speech to the enlarged meeting of the Political Bureau of the Party Central Committee on 18 August 1980, Comrade Deng Xiaoping pointed out that "it is necessary to gradually reform the factory director responsibility system and the factory manager responsibility system under the leadership of the party committee and to gradually popularize through trial points the factory director responsibility and manager responsibility system under the leadership and supervision of the joint committee composed of the management committee, company board of directors and economic integrated organs." He also stressed: "Following the decision of the Party Central Committee, some matters still have to be put on a trial basis so that we can acquire experience, gather the wisdom of the collective, and so that each matter can be solved when the situation is ripe. The decision on each matter has to be made by the Party Central Committee, coupled with a feasible system and regulations that are worked out by the Party Central Committee and that can play their role over a long period and that can only be implemented step-by-step. Before the new system and regulations are declared by the Party Central Committee, the tasks of various departments concerned must be carried out according to the existing system." At present, there are dozens of enterprises throughout the country carrying out experiments, and they are shouldering the glorious tasks of exploring and pioneering a new and complete Chinese-style leadership system for socialist enterprises. The enterprises that are not carrying out experiments are still following the existing factory director responsibility system and workers' congresses system under the leadership of the party committee. But a number of enterprises are implementing the party's leadership over ideological and political work under the principle of separating the party's work from administrative work and perfecting the workers' congresses system and factory director responsibility system in their efforts to make preparations for the necessary reform, even though they are still operating under the existing system.

The reform of the leadership system of enterprises is a major step not only because it is part of the reform of our political system but also because it is directly related to the reform of our economic system. Like the reform of other systems, the reform of this system also needs people's unified ideological understanding, because of some views that have been formed through habit over the past long period, some comrades do not really understand the necessity and great significance of carrying out reform, and therefore they are skeptical about it. Such a situation is inevitable. These comrades hold that when separation of party and administrative work is carried out and the party alone acts as the nucleus in the leadership over ideological and political work in enterprises and does not directly manage the enterprises, the party will then lose "power." Since the party does not have the "power," people will not listen to it and such a situation shows that the party's prestige has dropped and its leadership has weakened. Is such a view correct? To answer this question we must analyze the following two points. First, we must basically understand the leadership role of the party, and second, we must proceed from the point of the development of history and see how the party should display its leadership role in the new historical period.

The revolutionary cause of the proletariat will not achieve victory unless the proletariat has its own vanguard as its leadership core. But any revolutionary cause is the business of the laborers themselves. Comrade Mao Zedong also said: "The basic principle of Marxism and Leninism is to enable the masses to understand their own interests and to unite in the struggle for their own interests." ("A Talk to the Editorial Staff of the JINSUI RIBAO" [SHANXI SUIYUAN DAILY]) This is the view which holds that the people will liberate themselves; it is also the basic view that has always been resolutely followed by our party. Comrade Liu Shaoqi explained this question in detail in his "On the Party" and this explanation merits our studying it afresh. He said:

"[Begin passage in italics] All the causes of us communists are the causes of the people. No matter how correct our programs and policies, they cannot be realized if the broad masses of the people do not directly support them and persist in struggling for them. Therefore, we must rely on the broad masses of people, and whatever we do is decided by their consciousness. Without this consciousness we will accomplish nothing and consequently we will do numerous but thankless tasks. As long as we rely on the consciousness of the masses and as long as they are truly and consciously mobilized, and there is a correct party leadership, all the great causes of the party will finally end with victory and succeed. Therefore, as the vanguard of the masses of people, we communists have the duty in carrying out any work when the masses of the people are not yet conscious to resort to all effective and proper methods to raise their consciousness. No matter how arduous our tasks are and how long the time required, this is the first task we have to do and we must do it well. We will be able to take the second step only when we have done a good job in the first step. That is to say, when the masses of the people are conscious, our responsibility is to guide them in action, in organizing and in struggle. When the people have been organized and they have waged struggles, in the past, we must proceed from their actions and enlighten them to become conscious again in the present. In this way we will be able to guide the masses step-by-step in their struggles for the basic slogans put forth by the party. This is the only complete role played by us communists, the advanced elements of the masses of the great people and great persons. There is no other role but this. If some people want to display their roles more fully, they may consequently make mistakes or turn to heroism, commandism, running things by themselves without consulting others or resort to bestowing favors." [End passage in italics]

He continued: [Begin passage in italics] "In the cause of the liberation of the masses of the people, communists must and can only act as their guides and must and can in no way become the "heroes" to replace them in making revolution. In carrying out revolutionary struggles, the broad masses of the people urgently need guides that are determined and have far-reaching views, because having good guides constitutes a necessary condition for the victory of the people. But the people do not need the "heroes" to replace them in making revolution because such "heroes" who are divorced from the masses will not be able to accomplish any cause of the liberation of the people." [End passage in italics]

This delicate explanation of Comrade Liu Shaoqi shows the correct relations between the party and the people; it also shows the true meaning and nature of the party's leadership. He said that the party can only display its role as a guide in enlightening the consciousness and further consciousness of the people. There is no other role. He said: "If some people attempt to display more roles, roles of the party, they may make mistakes." All these words are by no means groundless; they represent a high point in the experiences gained by our party during the long period in guiding the broad masses of the people in waging revolutionary struggles.

The party's leadership differs from administrative leadership. Comrade Mao Zedong pointed out in "On Correct Handling of the Contradictions Among the People": "In order to be able to effectively carry out production and study and to live in an orderly way it is common knowledge that the people demand their own government, leaders in production as well as leaders in cultural and educational organizations to issue various proper and coercive administrative orders; without such orders it would not be possible to maintain social order." But the party's leadership is totally different from administrative leadership. Comrade Mao Zedong said in "The Question of Political Power of the Base Areas Resisting Japanese Aggression": "Having the power of leadership does not mean that we should shout it as a slogan the whole day long, nor does it mean arrogantly ordering the people to obey us. It represents a correct policy of the party and its own exemplary work; it means to persuade and educate the people outside the party so that they will be willing to accept our suggestions."

During the years of the revolutionary war when we were carrying out underground struggles under white terror, our party did not hold political power except in the base areas. That is to say, our party did not have "actual power" that was incessantly thought of by some comrades. However, we led hundreds of millions of the people in overthrowing the three big mountains that were suppressing the people, and we finally founded the great People's Republic of China. What does the party rely on in realizing its leadership? It relies not on its own power but on the principles and policies that represent the interests of the broad masses of the people. What method does the party resort to in carrying out its leadership? [The party] relies not on administrative order but on the method of persuasion and education, on propagating and organizing the masses and influencing and leading them in carrying out its own exemplary deeds. By relying solely on this, the party was able to make the whole people consciously listen to and follow it in realizing the great task of the new democratic revolution.

Our party became the ruling party after the liberation of the whole country and it has enjoyed high prestige among the people. Closely following the party, the people across the country have launched great struggles in carrying out socialist revolution and socialist construction. The position and tasks of our party have changed since it became the ruling party. But the nature of the party and its relations with the masses have remained unchanged. It can be said that the leadership of the party is still displaying the role of a guide. But because our leadership system did not in a certain period differentiate party work from administrative work, the two have been mixed for a long time, and this system is in fact a system under which the party is also engaged in administrative work. As a result, some comrades have gradually lost the glorious tradition of the party, and intentionally or not, they have become rulers of the people issuing orders instead of persuading and educating them, and they have resorted to administrative leadership to replace ideological and political leadership. To "replace administration with party" is in fact also to "replace party with administration," and this has resulted in weakening and even abolishing the party's leading role. If this abnormal situation continues, the party is likely to degenerate and become itself in opposition to the people. We must clearly sense the danger of this situation.

Our party's general task in the new historical period is to unite the people of various nationalities throughout the country and mobilize all positive factors so as to go all out with one heart and one mind, aim high and achieve greater, faster, better and more economic results in building a modern and powerful socialist country. Realizing this very arduous task can be compared with the revolutionary war to overthrow the oppression and rule of imperialism, bureaucrat capitalism , and feudalism. Whether this mission succeeds or not also depends on whether the party is able to mobilize the whole people ideologically and politically and to organize them so that they will be conscious in making contributions to the realization of this historical task.

Basically the leading role of the party is that mentioned by Comrades Mao Zedong and Liu Shaoqi, that is to enlighten the people to become conscious and then conscious again and to lead them to liberate themselves. Concretely speaking, the tasks of different historical periods have different natures. The task of the party during the period of the revolution was to lead and organize the masses to defeat the enemies; but its main task during the construction period is to establish and constantly perfect the socialist democratic system, lead and support the broad masses of the people in exercising their rights as the masters of their own house and to consciously manage the state, enterprises and all other causes so as to accomplish the great task of building socialism.

The socialist democratic system includes political democracy and economic democracy. The nature of the current reform of the economic system is to establish an economic democratic system of socialism. The results of this reform will realize the presumption of Marx and Engels that our enterprises are united organs composed of free and individual producers on an equal basis, while social economy is a big union of all united organs and all free producers consciously carrying out their social labor under rational and unified planning. To realize such an economic system with democratic union and democratic management cannot but rely on the consciousness of the hundreds of millions of laboring people. Reform of the leadership system of enterprises according to the principle of separating party work from administrative work is needed not only in strengthening the party's leadership but also in realizing such a democratic economic system.

Some people have held that since enterprises are grassroots units with production as their main task, if party committees do not grasp production they will have nothing to do. Is this a fact?

The party committees in enterprises are the party's grassroots organizations and they represent the leading core of the ideological and political work of these enterprises. Separating party work from administrative work will help to overcome the tendency of confusing the party's work with administrative work and of the former replacing the latter. It does not mean discarding or weakening the party's leadership; on the contrary, it sets a higher demand on party organizations in carrying out ideological and political leadership over various organs and the broad masses of the people in enterprises so as to guarantee that the party's principles and policies are implemented in enterprises. But it does not mean that party committees no longer care about production and administrative work; it means that the party committees do not directly interfere with but rely on the method of persuading and educating the masses through the strength of party organizations so that they will be able to improve the efficiency of their leadership. It also means that party committees will have more work to do.

/First, party committees must guarantee that party's principles and policies are conscientiously implemented in enterprises./

The party's political leadership over enterprises is mainly shown in the leadership over principles and policies. The party's major principles and policies are worked out by the Party Central Committee. Some principles and policies are announced or passed down through legal forms by government departments under the leadership of the party. With regard to these, party, administrative, trade union, youth league and other aspects within an enterprise all have the responsibility to implement them.

Party committee secretaries have the responsibility, on behalf of the committees, to make political reports to workers' congresses or plenary sessions, to talk about situations and explain principles and policies from the point of view of enterprises and point out the orientation of these enterprises. The party committees may make suggestions with regard to the topic of workers' congresses and, through persuasion and education by the representatives of party members, guarantee the implementation of the party's principles and policies and government laws and orders. Though administrative, trade union and youth league organizations in enterprises are not subordinate to the party committees, the latter still have the responsibility to acquaint themselves with the work of these organizations so as to help them correctly implement principles, policies and laws and orders.

/Second, it is necessary to strengthen the building of party ideology and organization and display the vanguard and exemplary role of party members./

In order to enable party committees to guarantee the implementation of the party's principles and policies in enterprises, they should have a good party work style and be able to display the vanguard and exemplary role of party members. If party members do not really understand the principles and policies of the Party Central Committee, comply in public but oppose in private, and are in a state of passive resistance or if they depart from the masses or take advantage of their power to seek private interests and resort to other unhealthy deeds, they will not be able to lead the masses in making progress. Therefore to strengthen the building of party ideology is an important premise for strengthening the party's leadership.

As party committees do not carry out direct administrative leadership over the work of enterprises, in order to guarantee the implementation of the party's principles and policies, the committees cannot but rely on the strength of their own organizations and the vanguard and exemplary role of party members to educate and unite the masses so that the broad masses of workers will be willing to consciously accept the party's leadership. In the past, as the work of the party was confused with administrative work, the party committees mainly concentrated their efforts on production and administrative work. As a result, they did not care about party work which seriously hindered the work of party building. With the division of work between the party and administration, the former will be able to concentrate its efforts on party building so that the party organizations will become organized and disciplined vanguard ranks that are the first to bear hardship and the last to enjoy comfort and have a close relationship with the masses.

/Third, rely on the whole body of party members and do a good job of ideological and political work in enterprises./

Persuasion is the basic method of our party in leading the masses and it is a party discipline that each party member must unconditionally implement the decisions of the party. But the party cannot force the broad masses of the people to follow its decisions. Party slogans can be turned into conscious actions of the masses only through the party's ideological and political work and mass work. If it resorts to coercive directives, superficially it will seem that the party is exercising leadership over everything, but actually such leadership has no vitality.

Both party members and the masses of nonparty members have the obligation to observe and implement government laws and orders. The responsibility of party members is not only to display their exemplary role but also to carry out ideological and political work among the masses so that the latter will be able to understand the relevant laws and under this situation party members will take the lead in observing and implementing the laws and orders together with the masses.

In order to do a good job in ideological and political work in enterprises, party committees must organize workers to study political theory in a planned way and to launch various lively activities of ideological education. At the same time, they must also rely on the whole body of party members to go deep among the masses to solicit their opinions, understand the ideological situation of the masses and talk with them individually in a bid to carry out meticulous ideological work so that both party members and the masses will spare no efforts in realizing socialist modernization with one heart and one mind.

/Fourth, support and guide the masses of staff and workers to display their role as masters of their own house and to correctly exercise their powers of democratic management of enterprises./

To realize democratic management of enterprises is an important step of the party in perfecting the socialist democratic system.

Since the founding of the PRC, under the leadership of the party, we have accumulated rich experiences in managing enterprises democratically. Most enterprises are still carrying out the workers' congress system under the party's leadership and a few are trial-implementing the method of dividing party work from administrative work and expanding the powers of workers' congresses so that they will become the top management organizations of enterprises and will have the power to decide production policies and management within the range defined by state law and under state planning.

Party committees must support and guide the workers of all enterprises in carrying out their powers of democratic management and regard this work as one of their main tasks. Following its constant perfection and development, the power of the workers' congresses may be expanded while party committees mainly strengthen their leadership over ideological and political work.

In implementing the democratic management of enterprises, it is necessary to correctly handle the relations of the interests among the state, the enterprise and the individual. Party committees must guide and educate the whole body of workers to understand the mutual relations between the overall interest and partial interests and between intermediate interests and long-term interests, to defend the proper right of both the enterprises and themselves and to prevent departmentalism and individualism from developing. Another question is to correctly handle the relations between democracy and centralism within an enterprise. While democracy must be fully displayed it is also imperative to strengthen centralized and unified command headed by the factory director (manager) over production and technological management on the basis of democracy so as to meet the objective needs of socialized mass production. Party committees must educate the whole body of staff and workers to observe labor discipline, implement rules and regulations and respect the power of the centralized and unified command of the factory director.

Fifth, display the role of mass organizations such as trade unions and the CYL and coordinate the relations among the party, government, trade unions and CYL.

Mass organizations such as trade unions and the CYL are helpful in assisting the party to propagandize and organize the masses. In strengthening the party's ideological and political leadership over enterprises it is necessary to display the positive role of these organizations. As the core of ideological and political leadership over enterprises, the party also has the responsibility of coordinating the relations among party, government, trade unions and the CYL. Party committees may convene liaison conferences of the party, government, trade unions and CYL or enlarged meetings so as to understand the situations and problems of various aspects, unify ideological understanding and coordinate work so that various aspects will be united in their efforts to fulfill various tasks of state planning and enterprises.

The reform of the leadership system of enterprises is an important part of improving the leadership system of our party and country; it is also an important content in the reform of the economic management system. We are confident that under the leadership of the party committees at various levels and by persisting in emancipating the mind, seeking truth from facts, consciously summing up experience and lessons and daring to be innovative, we will be able to create a more perfect leadership system for enterprises that accords with the new historical period and make greater contributions to the strengthening of the party's leadership over enterprises as well as to the realization of socialist modernization.

'JINGJI GUANLI' ON DISTRIBUTION, REWARDS

HK080856 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 7, 15 Jul 81 pp 58062

[Article by the Shoudu Iron and Steel Company: "Uphold the Principle of Distribution According to Work and Properly Practice the Reward System"]--note passage within slantlines denote boldface type]

[Text] Under the direction of the correct guideline defined in the 3d plenary session of the 11th CCP Central Committee, our company officially resumed the reward system in the fourth quarter of 1978. Since then, we have quite conscientiously eliminated the influence of "leftist" thinking, combined the strengthening of ideological and political work with the amplification of the responsibility system and the practice of the reward system, and banned the reckless issuing of bonuses and equalitarianism; thus enabling the principle of distribution according to work to be carried out better, in bringing the function of bonuses into full play as an economic lever and mobilizing the socialist initiative of the broad mass of workers and staff by strictly enforcing the state's regulations concerning the reward level. We have achieved fairly good economic effects so far.

The principle of distribution according to work is one of the basic characteristics of socialism. However, people cared not conscientiously carry out this principle for a long time and the tendency of equalitarianism in distribution was really serious due to the influence of "leftist" thinking on economic work. The situation became worse during the 1-year turmoil when the principle of distribution according to work was defamed by the cliques of Lin Biao and the gang of four as "soil which fosters capitalism." During the period between the smashing of the gang of four and the third plenary session, the problem of bonuses still remained a forbidden zone in the economic field because of the trammels of the "two whatevers." When we decided to resume the reward system in the fourth quarter of 1978 and set up prizes for excellence in the complete chain in some plants and mines, some people even publicly criticized us for "intending to buy 'the four modernizations' with bonuses" and "resuming revisionist material incentives," and hence shook the conviction of some leading cadres in our company. Confronted with this situation, we armed ourselves with the guideline of the third plenary session, and resolutely enforced prizes for excellent in the complete chain of production. In the meantime, we embarked on discussions concerning the criteria for truth among all the staff and workers and successively at the end of 1978 and in the second half of 1979. We tried to lead them to link the discussion with ideological reality, centering on the question of whether the reward system based on the principle of distribution according to work should be practiced, so as to eventually correct misunderstandings and reestablish the correct conviction. The discussion achieved a breakthrough on the issue concerning the forbidden zone of reward, and the cadres at different levels confirmed their conviction in carrying out the reward system.

However, that one dares practice the reward system does not mean that one can correctly practice it. Since the influence of the "leftist" practices of egalitarianism and eating out of "a big pot" have lasted for a long time and become deeply rooted, "leftist" thinking has always persisted in showing itself almost every time we move a single step forward in carrying out the reward system. Therefore, in order to correctly carry out the reward system, we have to struggle all the way against "leftist" thinking and insist on unremitting education on distribution according to work for cadres and the masses. Over the last 2 years, we have reached a relative consensus on solving the following problems:

//First, is the bonus a fixed income or encouragement for work in excess of the quota?//

We began to enforce the reward system of winning prizes for excellence in the complete chain of production in a number of major plants and mines in the fourth quarter of 1978. Under this system, those major productive plants or mines are chosen as the "dragon heads," and the staff and workers of all auxiliary departments which directly coordinate the "dragon heads" are grouped together respectively in accordance with the production processes to form units of "one dragon" for prize appraisal. There are 10 "dragons" in the whole company. The assessment of such a reward system is based on 2 key points. The first point is comprehensiveness, in other words, the overall economic effects of the "dragon head" must be comprehensively assesses, which include various norms of technical economy such as output, quality, variety, consumption, and on on. For any norm not attained, the bonus for everyone who is in the chain will be reduced. The second point is "excellence," that is to say, the reward standard must be worked out in relation to the average advanced level. Those who attain the standard and win the championship of their trade in the whole country will get double prizes; those who win the championship yet fail to attain the standard or attain the standard yet lose in the championship competition will only get lesser prizes. The assessment standard is a floating one; as the level of the champion in the same trade rises month after month, the assessment standard will be raised correspondingly. Obviously, it is rather difficult to win the prize under this reward system. Therefore, there arose a lot of misgivings among the staff and workers. Some cadres, in consideration of the low salary level of many staff and workers, always tend to increase the certainly for them winning the prize and reduce the chance of losing bonus. Some staff and workers prefer to turn the winning prize for excellent in the complete chain into individual prizes for various single items, and get rid of the assessment of overall economic effect. So, as bonuses are to be issued when any single norm is attained, "the West will light up though the East does not," and their income can be ensured. Some comrades have asked for a lower standard for rewards. They reckon that bonuses should be issued only if the state plan is accomplished; the bonuses are to be increased if a high standard is achieved, yet not to be reduced if the championship is not won.

After analysis, we believe that all the abovementioned thinking is the manifestation of egalitarianism in the reward system, and that the focus of debate is on the nature of the bonus, the essential question of whether the bonus is regarded as the encouragement for work in excess of the quota or as fixed income and welfare payment. For this reason, after having reached a common understanding within the leading group, we began to carry out ideological education of cadres and the masses, centering on the understanding of the nature of bonuses. The emphasis was placed on the following points. 1) The bonus is an encouragement for work in excess of the quota, not a fixed income, still less is it a welfare payment to staff and workers. To complete the state plan is just to fulfill one's basic duty. It is a basis for salary calculation but not for bonus calculation. 2) The assessment of work in excess of the quota must be based on that of the overall economic effect. Only on the premise that the economic revenue of the state is increased, can enterprises retain more profit and individuals get more bonus. 3) For bonuses to promote the improvement of production technology and administration and management, the assessment criteria must be set above the average advanced level and be subject to change. 4) As the prize for excellence in the complete chain embodies the abovementioned basic principles of the reward system, it is an advanced and reasonable system which should be upheld.

As the leading cadres at different levels have reached a common understanding on the nature of bonuses, the leading groups of many units which used to actively call for the lowering of assessment criteria in the name of "representing the voice of the masses" have now turned to strengthening management with the support of the masses and are striving to create a new level and reach a high standard in an effort to win the championship. For example, the steelworks linked the 4 norms stipulated by the company for winning the first prize with other economic norms, adding up to 13 norms of 9 types altogether, changed from big to small, enforced them at every level, and put forth 3,471 assessment standards for all 1,059 workers in the plant according to division of labor in accordance with the post responsibility system. The assessment is strictly related to the standards and linked to the reward system, and the bonus is calculated according to division of labor. As there are standards to be aimed at in working, working results are subject to assessment, rewards and punishment are based on regulations, and the post responsibility system is solidly carried out, the production level has been boosted. In the 2 years from 1978 to 1979, our company achieved national supremcy for three of the technological norms including the capacity factor of steel conversion, the consumption of iron and steel materials and the average life span of furnaces, which also reached the world advanced level. The function of rewards in raising production has further been brought into play since we vigorously popularized throughout the company the method of managing steelworks centered around the post responsibility system while standards, assessment, and rewards and punishment are combined three-in-one.

//Second, is the bonus to be distributed equally or differentiated according to the extent of the contribution?//

In our enterprise, because of the difference in division of labor, there are differences in responsibility and contribution between the major productive plants and mines and the auxiliary units, between major posts and minor ones, between cadres and workers, between leading cadres and general ones. There is a difference in efficiency between two persons even though both of them are working at the same post. Only by taking these factors into account in distributing bonuses can the principle of distribution according to work be realized. However, due to the influence of egalitarianism, we had to face up to an intense ideological struggle when we were ready to differentiate the amounts of distributed bonuses according to the differences in responsibility and contribution and based on the assessment of everyone's results. Some advanced staff and workers who were making conspicuous contributions were wholeheartedly in favor of such a practice, but worried that bigger bonuses would lead to "divorcement from the masses." Those backward staff and workers, in particular those who were doing badly in their work and used to profit from the egalitarian practice of "everybody sharing a spoon of soup," really had a strong aversion to this since they could no longer out of a "big pot" and get a "bonus for peace and tranquility." They were afraid that the strict assessment and the bonus calculation according to division of labor would expose their backwardness; some of them even defamed the methods of assessment, and reward and punishment, as "local policies" exclusively invented by the Shoudo Iron and Steel Company. Some leading cadres worried that the differentiation of bonus distribution would "expand bourgeois rights," and believed that equal distribution had better be adopted so as to "minimize contradictions and do the job well."

To cope with these circumstances, we enforced the education on distribution according to work once again. We quoted first of all from volume 10 of "Manuscripts of Lenin" the discussions concerning the settling up of the individual responsibility system, the improvement of working efficiency and the practice of a strict system of rewards and punishment, compiled all these quotations and then printed and distriubted them to the basic levels in order to vigorously propagandize the great significance of carrying out the three-in-one management system of standards, assessment, and reward and punishment. Next, in conjunction with the trial-point expansion of enterprise autonomy which was under way in the Shoudu Iron and Steel Company, we tried to elaborate on the fact that the amount of bonus is dependent upon how well and enterprise is operated since the system of retaining a portion of profit has been adopted in the enterprise. In order to open up a source of bonus, every worker and staff member has to work hard at his own post to improve the economic effect of the whole enterprise. The more products the state can purchase, the more profit the enterprise can retain and the more bonuses are available. The three-in-one method of standards, assessment and reward and punishment is really a good one, which directly links the economic effects of an enterprise with the working efficiency of everyone and the amount of bonus for everyone, and embodies the conformity of interests between the state, the enterprise and the individual. Finally, we have reiterated the harmfulness of egalitarianism and the advantages of the discrimination between rewards and punishment. We have elaborated on the question not only from the angle of theory but also from that of practical experience. Not only have the leading cadres talked about the problem but also the masses have been motivated to engage in the debate. Many cadres at the basic levels and the masses have cited numerous facts to show the encouraging changes emerging after the responsibility system had been linked to the reward system. Now the examples of full work attendance and full working hours have been increased, while those who shirked the job on the excuse of being since have become fewer and fewer. Accidents in production have been reduced as more people have started to observe the production regulations and discipline. More people have become conscientious and responsible while those careless and perfunctory people have become fewer. More people have begun to be concerned for the collective and production while those who are concerned only for themselves have become fewer. There is another conspicuous manifestation of "leftist" thinking in the distribution of bonuses. For a long time, it had become an understood rule that the reward level for cadres, especially for leading cadres, should be lower than that for workers. It seemed that a "privileged stratum" would be formed and "revisionism" would revive if cadres took more bonus than workers did. In order to break through this forbidden zone, in the second quarter of last year, we widely organized cadres of various types at different levels to work out detailed working regulations according to the division of duties and working process, and made them the basis for the appraisal of cadres' work and for rewards and punishment. On the basis of strictly inspecting, checking and accepting the work of cadres according to the duty responsibility system and the detailed working regulations, we began to enforce step by step the duty prize for cadres, raise the bonus level for them, and differentiate the reward levels in accordance with their tasks and responsibilities. This reform of the reward system provoked yet another debate among the masses. Some people said, "the cadres just sit in the office and do not sweat their guts out, yet take more bonus than we workers do. What an unreasonable thing it is!" Some cadres themselves also felt that they were in the wrong, they say "sharing more bonus is nothing more than bringing vexation on oneself. It just makes us unable to speak justly and forcefully and makes our work more difficult." To cope with such thinking, we unfolded once again the education on distribution according to work.

We quoted from Marx' "Das Kapital" the expositions on the indispensability of management in enlarged production and the duality of management, so as to support our argument that the management labor is an important type of productive labor under the socialist system, and management personnel are also one of the component parts of the proletariat. By criticizing the old erroneous "leftist" views that negate enterprise management and revaling the harm they brought about in practice, we convinced everybody that the cadres, though not sweating out their guts like workers, do make a contribution in all sorts of professional management work which is really indispensable. We also made an evaluation of the outlay in issuing duty bonuses to cadres, showing that the average bonus amount for cadres would still be less than that for workers who made conspicuous achievement although we had raised the bonus level for cadres. The workers found the truth at last through detailed evaluation. They said, "The cadres come to work earlier and leave later, taking on heavier tasks and greater responsibilities, they absolutely deserve to share more bonuses, and this completely conforms with the principle of distribution according to work!"

As we have upheld the principle of more work more may and banned the egalitarian practices in bonus distribution, we have achieved great success at the expense of less bonuses, and the enthusiasm of the staff and workers has been raised higher and higher. People say, in the past bonuses were distributed either in a way to "taking turns to be the dealer" or according to the leading cadres' impression of each workers; but the situation has been changed now, the amount of bonus depends on each person's contribution, the evaluation of the contribution is based on assessment, and rewards and punishments are fairly balanced. There were 19,483 persons participating in the competition for the first prize for excellence in the complete chain in the company last year. The outlay for regular bonuses amounted to 2.93 million yuan, equivalent to a standardized average sum of salaries for 2.78 months; everybody shared 12.52 yuan a month on the average. This conforms to the State Council's regulations by which a well operated enterprise can issue in 1 whole year a total sum of bonuses not exceeding the sum of salaries for 3 months, with the authority of the department concerned.

//Third, should the assessment on reward standards be strictly practiced?//

Only by the strict assessment of reward standards can egalitarianism be prevented in the distribution of bonuses. For this reason, in August last year we convened a congress of staff and workers in which the decision for stricter assessment of reward standards was adopted and stress was put on the 100-percent enforcement of the system. All offences against the system of regulations, whether or not they have caused accidents or losses, have to be recorded and reported, and the offenders will be disqualified from accepting bonuses for that month. A disturbance arose as soon as the resolution was announced. Those who used to overlook the organizations and discipline and have serious anarchic tendencies had a particularly strong aversion to this measure. Some said, "It is too absolute a deed to carry out the rules and regulations by 100 percent. To assess like this is really too strict." Some others said, "Those cadres are trying to bind our workers." Feeling the great pressure, team and group leaders and cadres were afraid that the workers would criticize them for applying the means of "controlling, blocking and oppressing." Hence, some of them never recorded or reported any offences against rules and regulations, and tried not to offend anybody; some tried to gloss over faults by attributing them to objective conditions and feared not reduce the bonus justly when it was found that some workers had not fulfilled the assessment standards. To cope with these circumstances, we unfolded once more the education on the principle of distribution according to work, emphatically solving the problem of hesitation in strictly carrying out the assessment, and criticized the "seeking good relations with all and sundry at the expense of principle" and anarchic practices.

Making use of the basic concept which Engels elaborated in "On Authority," we pointed out to the masses of workers that strict management is an ojbective requirement for enlarged production. We propagandaized a well-known saying by Engels, "at least in terms of working hours, we can put up such a note at the main gates of the plants: Those who enter by this gate please give up all autonomy!" In the meantime, we pointed out that the fear of strict management is an expression of small producers' individualistic aversion to discipline while carrying out the rules and regulations by 100 percent is the duty and responsibility of the working class. On the other hand, we also criticized the once popular erroneous argument which only put emphasis on "abolition" and "revolution" and overlooked "establishment" and "construction" concerning rules and regulations. We mobilized the cadres and workers to draw bitter lessons from examples of offences against rules and regulations, which caused accidents, to sum up experience from practice of strict enforcement of rules and regulations, which led to the stabilization and growth of production, to make clear the truth that "being strict is low, being lax is doing harmful." So we made the cadres and the masses understand that to allow offences against rules and regulations to pass unpunished seems outwardly to be "concern" for the interests of the masses of workers, but actually means dereliction of duty for the workers' safety; those cadres who "seek good relations with all and sundry at the expense of principle" are in fact bad cadres.

//Fourth, in raising the reward level, should we simply raise the amount of bonus, or further bring into play the reward system as an economic lever?//

Apart from the first prize for excellence in the complete chain awarded to the major plants and mines and those posts directly coordinating with them, and the duty bonuses designated to cadres, there are 26,000 or more staff and workers of auxiliary units receiving an all-inclusive bonus whose level is lower than the former two by around one half. At the beginning of this year, when convening the congress of staff and workers to work out the reward scheme, we planned to adopt a modified all-inclusive reward system to properly raise the reward level for this section of people. An ideological struggle was then unfolded between the opinion to uphold the principle of distribution according to work and that of practicing egalitarianism, centering on the problem of how to raise the reward level. In accordance with the principle of distribution according to work and more work more pay, these auxiliary productive units cannot win a raised bonus level unless they can ensure the completion of the assigned production tasks, manage to improve labor productivity and open up new ways of production, and thus increase the state's profit. However, the leading cadres of some auxiliary plants and mines, worried only about bonuses and regardless of their share of contribution, just look forward to simply raising the amount of bonus and do not want to set practicable advanced standards of assessment. In promises to the workers of their own units, some people even said, "I have got to fight for bonuses for all of you even if it means losing my job as secretary or director." To cope with these problems concerning ideological understanding, we organized the leading cadres of plants and mines to unfold a discussion on how to raise the reward level, and tried to guide them to make it clear that bonuses are not a welfare offer but an economic lever to enhance production. The raising of the reward level must be accompanied by the raising of the assessment standards for rewards. If we simply raise the amount of bonus, the bonus will not be able to function as an economic lever. With a common understanding reached, we organized those auxiliary units to work out, according to their own specific conditions, concrete schemes to properly raise the bonus level on the premise that the assessment standards are raised and more wealth is created for the state, thus we improved the all-inclusive bonus and mobilized the initiative of the staff and workers in broadening the sources of income and reducing expenditure. For example, when the original all-inclusive bonus system was in force in the electricity plant, every worker could get 6 yuan a month if he fulfilled the planned task. Starting from February this year, we replaced the old system with a new one which links the amount of awarded bonus to the electricity supply rate reward issued by the electricity supply bureau, on the premise that all the assessment indices are fulfilled. As the reward system has been modified, the electricity plant has begun to make every effort to rationalize electricity supply and reduce the loss of power in actively coordinating with the departments concerned. The comprehensive electricity supply rate was 0.94 in January, and was raised to 0.96 in February and March. The electricity supply rate bonus was 36,000 yuan in January, and rose to 87,000 yuan in February and 102,000 yuan in March; the average bonus per month for every worker or staff member was 6 yuan in January, 8.1 yuan in February and 9 yuan in March. Now the economic gain of the enterprise has become more eminent since, in modifying the reward system, we have combined economic responsibility with economic effect and economic interests, "awarded people according to their contributions," fairly discriminated between rewards and punishment, and thus given full play to the function of bonuses as an economic lever, and pushed ahead with the mass drive of broadening the sources of income and reducing expenditure. Compared with the same period last year, the whole company has achieved a growth in profit of 15 percent in the first quarter of this year, even though the output of steel has decreased by 4.41 percent since the state has reduced the production quota. A good situation of more profit for less output has taken shape.

To meet the requirements of economic readjustment, the quota of steel and iron output set by the state for our company this year has been cut to a lower level than last year. Facing this new situation, egalitarianism did not miss the opportunity to emerge again. Some people thought that we need not strive any more for higher standards and the first prize since the quota had been lowered. They even announced that the first prize for excellence in the complete chain was a "leftist" mistake, and wanted to return to the old path of eating out of a "big pot." In order to refute these arguments, we clearly pointed out the following facts. 1) It is on the basis of the present production level which is close to or has even reached the advanced level at home and abroad that we are mobilizing the masses to create a new level and strive for the first prize. Therefore it is fundamentally different from the old practice of seeking a "high index" despite the objective practical conditions. 2) The first prize for excellence that we are practicing is designed to examine the comprehensive economic effects and is basically different from the "leftist" deeds of one-sided pursuit of output. 3) Although the output quota for iron and steel has been cut, we still have to strive for an increase in the production of those products such as rolled steel, steel tubes and so on which are needed for light industry, the textile industry and agriculture, while actively promoting the production of everyday consumer goods needed by the market. Although the production of iron and steel is confined, we still have to create a new level and strive for the first prize in the operation of blast furnaces and conversion furnaces. We would rather spend part of the time on maintenance than carry on production at a lower level, letting the enterprise be slack and perfunctory and the morale of the workers become lax. Aiming at a high level which is economically rational technologically practicable and actually possible, we have put forth a new objective of struggle this year, and also added some new assessment standards such as energy consumption for a process, administration of environmental protection, production of consumer goods, work to keep the surroundings of the factory green, and so on.

In practice, we have found that the tenacious struggle against egalitarianism must be upheld unremittingly so as to solidly carry out the principle of distribution according to work.

Practice over more than 2 years has enabled us to find out an effective way of upholding the principle of distribution according to work and carry on the struggle against egalitarianism. That is to closely combine ideological and political work with a strict responsibility system and a rigorous scheme of rewards and punishment. In the past, in handling the relations between these three types of work, we always emphasized "combination" on paper yet practiced divorcement in effect. When stress was placed on strengthening business management and linking the responsibility system to that of rewards and punishment, some cadres would always regard this way as the only means to push forward the work, or even misunderstand that ideological and political work was dispensable. Conversely, when stress was placed on ideological and political work and the construction of spiritual civilization, some other cadres would tend to regate the responsibility system and the reward system, and be ready to return to the old path of "spirit is omnipotent." In fact, the responsibility system, the reward system and the ideological and political work are not at all in conflict with each other but are related to and complement each other. None of them is omnipotent and none can work independently. Of them, management is the basis of the various work of an enterprise. Without rigorous business management, rewards will lose their objective basis, and the principle of distribution according to work will not be able to be actually carried out. The distribution according to work, which provides an enterprise with economic impetus, is the link between the interests of the state, the enterprise and the individual. It can turn a laborer's focus of attention from private material interests to those of the enterprise and the collective, and push him to actively engage in business management, and thus make the ideological and political work more convincing. Ideological and political work is not only the important guarantee for the enforcement of the responsibility system and the reward system, but also for the strengthening and improvement of the party's leadership and the construction of socialist spiritual civilation.

Over a long period of time, we failed to handle well the relations between ideological and political work, the responsibility system and the reward system. One of the important reasons for this, apart from the pernicious influence of "leftist" thinking, was the absence of a form to properly combine these three matters.

In order to solve this problem, since the fourth quarter of last year we have unfolded education to strengthen the sense of responsibility of staff and workers being masters of the enterprise, in combination with practicing trial-point "responsibility for one's own profits and losses." And this year, we are driving the campaign further while unfolding the discussion on the topic of "serving and being responsible to the people." In the campaign, we have paid attention mainly to the following matters. The first is to give an education of the revolutionary outlook on life and unfold the discussion on "who one is working for." We have propagandized the communist work ethic of "serving and being responsible to the people" to negate the hired-hand mentality of "looking toward money in everything." The second is to give an education about the conformity of the interests of the state, the enterprise and the individual, in combination with trial-point reform of the system. We tried to make the workers realize their status as masters and understand that they are working today first for the state, then for the enterprise and also for themselves. The third is to further amplify such democratic management committees as staff and workers' congresses, various democratic management committees, advisory committees, and so on, to enable the staff and workers to get a sense of being masters of the state and masters of the enterprise through real participation in management.

The educational campaign to foster a sense of being masters has organically bound ideological and political work, the responsibility system and the reward system together. This educational campaign was vigorously strengthened the sense of responsibility of the broad masses of staff and workers in politics and their enthusiasm and initiative in production. It has animated the responsibility system, provided distribution according to work with a basis, and also tightly combined ideological and political work with production management so as to make it more lively and increase its fighting strength.

'JINGJI YANJIU' ON ECONOMIC MANAGEMENT SYSTEM

HK140359 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 7, 20 Jul 81 pp 11-24

[Article by Ma Hong [7456 3163]: "On Several Questions of Reforming the Economic Management System"]

[Text] Why It Is Necessary To Reform the Economic Management System

What is the economic management system? On the whole the economic management system is economic relations. The economic management system also includes economic management work, therefore, it involves the superstructure. But in essence, it is production relations, that is economic relations. And economic relations are relations of material interests.

Reforming the economic management system means readjusting and improving the economic relations, that is readjusting and improving the relations of material interests in the various aspects of the national economy. In the economy under the system of ownership by the whole people, there are the relations between the center and the localities, between the state and enterprises, between enterprises themselves, between workshops in enterprises and between enterprises and their staff and workers. Enlarging the autonomy of enterprises means readjusting the economic relations between the state and enterprises. Our state-run enterprises should all be relatively independent economic organizations. They should be economic cells that are full of vigor. Each state-run enterprise should have its own interests that are unified with and at the same time different from the interests of the state. We must see, accept and correctly handled this point. Only in this way can we correctly handle the relations between the state and enterprises, between enterprises themselves and between enterprises and their staff and workers, and only in this way can we bring the initiative in various fields into full play so as to serve the four modernizations.

The economic management system now carried out in China is a highly centralized system that takes administrative management as the dominant factor. Viewed from its basic form, this sytem is similar to the system carried out in the Soviet Union in the latter period of Stalin during the 1950's. Our country's practice in the past 30 years has proved that this system has quite a few drawbacks, which can be summed up in the following four aspects: First, enterprises have become subordinated to the administrative institutes at various levels, and the enterprises' relative independence is negated. Our enterprises are like the beads of an abacus, they can be pushed up or down by the various central ministries and by the various departments and bureaus in the localities. These enterprises have little initiative. It is not that the enterprises do not want to have initiative, but our system has restricted their initiative. Second, the economy is managed according to the administrative system and administrative districts. They have formed their own systems and served the internal relations of the economy. For instance, our enterprises are managed according to conventional rules and regulations by the responsible departments of the center or the localities. In the main they exercise vertical relations, lacking horizontal relations. So many irrational phenomena have emerged. Third, too many plans and quotas are fixed by directives from above. Control from above is too tight. The producers cannot get in touch with the consumers directly. Production is divorced from marketing and demand. Thus, products are stockpiled in large quantities. On the other hand, many products are not marketable. Fourth, state monopoly for income and expenditure, holding "iron rice bowls," eating out of a "big pot," egalitarianism, economic irresponsibility and disregarding economic effect are the rule.

This economic system does not comply with the objective law for the development of the socialist economy. It is not suited to the requirements for developing the socialist commodity economy, to satisfying the people's everincreasing and ever-changing needs or to the requirements for getting the maximum economic effect with the minimum consumption of labor. Under this system, the state monopolizes the formulation of all plans, or purchase and marketing, or assignment and allocation of labor and of the use of income and the arrangement of expenditure. All this inevitably requires an integrated management system that is highly centralized, with administrative means as its dominant factor. It even refuses to use economic means to manage the economy. Under this management system or method, it is impossible to rapidly develop the socialist commodity economy. The situation in which our present economy is not brisk and economic results are bad is closely related to the drawbacks of our present economic system.

The reason why we have implemented this economic management system for a long period of time is the lack of understanding of the character of our socialist economy. Specifically speaking, in the past, we did not regard the socialist economy as a planned commodity economy, but actually as a natural or semi-natural economy. Now if we want to reform our economic system, we must have a correct understanding of the character of our socialist economy. This is the prerequisite for correctly solving the questions of orientation, principles, policies and methods for reforming the economic system.

How should we understand the character of our country's socialist economy? There are still different views on this question. A comparatively unanimous view is that China's socialist economy at the present stage is a planned commodity economy. Of course, there are persons who do not agree to this view. The central issue is whether the means of production exchanged under the socialist system of ownership by the whole people are commodities. Some comrades think that they are not commodities. Therefore they hold that the socialist economy is not a commodity economy. In the past, this viewpoint occupied a dominant position. There are persons who still hold on to this viewpoint.

In my view, China's economy is a planned commodity economy. Of course, this commodity economy is different in nature from the commodity economy of a capitalist society. The capitalist commodity economy is based on the capitalist system of private ownership and it is unplanned. The system of public ownership occupies an absolutely dominant position in the socialist commodity economy, which is a planned economy.

Accepting the viewpoint that the socialist economy is a planned commodity economy constitutes great progress and a leap in theory. We know that the question of socialist commodity production has been under discussion for more than 100 years and that there has been much argument on this question among Marxists. In "Critique of the Gotha Program," Marx said that socialism is the early stage of communism and that it still retains traces of the old society. The traces of the old society Marx talked about are mainly meant that "bourgeois rights" are still retained in the principle of distribution according to work. At that time, the socialism Marx envisaged was based on highly developed capitalism. Under such socialism, there was no relation between commodities and currency. Marx failed to foresee that socialist revolution could win and socialism could be built in countries where capitalism was only moderately developed and even in a country like ours where capitalism was in its early stages and the natural economy still occupied a dominant position. To build socialism in a country like ours where the economy is so underdeveloped, it is necessary to fully utilize the relations between commodities and currency. In other words, the socialist economy at the present stage is a planned commodity economy.

We can also consider such a question as this: In the highly developed capitalist countries, when the working class has seized political power and built the socialist system, may commodity production and money be abolished immediately? Quite a number of Marxists are now considering this problem. In these few years, I have had the opportunity to go to Japan, the United States and several developed capitalist countries in West Europe on a fact finding mission. The comrades who took part in the mission had a common viewpoint that the economy of these countries is much more developed than what was described by Marx. Things are different from what they were 100 years ago. Marx did not foresee that 100 years later the capitalist economy would have developed to such a high degree. One hundred and five years after Marx wrote "Critique of the Gotha Program," there has been greater development in the productive forces of the developed capitalist countries than the period in which Marx lived. Even though the economy has developed to such a stage at present, can the proletariat abolish the commodity economy and currency immediately after seizing political power in these countries without bringing chaos to the economic life of the society? It seems it is not possible. If the term "currency" is changed to "labor coupon," which still plays the role of currency, what significance does it have? Many problems will certainly emerge, if currency, that is the commodity economy, is really abolished. The Mitsukoshi Department Store in Tokyo, Japan, deals with 500,000 types of commodities, while our country's biggest department store, the First Department Store in Shanghai, deals with more than 40,00 types of commodities and the Beijing department store deals with 24,000 types. There are 14,000 types of foodstuffs in a supermarket in a small city with a population of nearly 200,000 people on the outskirts of San Francisco. If the relations between commodities and currency are abolished, how would we effectively allocate these products? Human beings invented currency after long years of innumerable practice in life. Currency has given great impetus to the development of the economy of mankind. If we want to abolish it, we must have something more rational to replace it. This is no simple matter. It seems that when the productive forces have not reached a highly developed stage, when labor has not become people's primary necessity, it is not so practical to abolish the commodity economy or to abolish currency. This viewpoint is a supposition, which must be proved in practice.

In his book "The State and Revolution" written before the October Revolution, Lenin quoted Marx's words and explained Marx's viewpoints in "Critique of the Gotha Program," which also advocated the abolution of the commodity economy and currency. After the October Revolution, the Soviet Union once implemented the communist economic system of the war period, mainly due to the imperialists' armed interventions and the civil war. But is does not mean that it was not related to the theory of the abolition of the relations between commodities and currency. The attempt to abolish the relations between commodities and currency under communism of the war period failed. Lenin summed up the experience and lessons and put forward new economic policies according to five economic components the Soviet Union had at that time and especially according to the situation in which a small commodity economy and small production were widely found. Under the new economic policies, they were to use the relations between commodities and currency to develop commerce and promote the rehabilitation and development of the socialist economy. Unfortunately, Lenin died too early, so he was unable to see the completion of socialist transformation. After the completion of socialist transformation, the Soviet Union did not have five economic components any more, but only a unitary socialist economy. Under such conditions, was the commodity economy still needed? It was too late for Lenin to answer this question, which Stalin had to tackle. Socialist transformation in the Soviet Union was completed under the leadership of Stalin. After the completion of agricultural collectivization, Stalin once pointed out that there were two systems of ownership, namely, the system of ownership by the whole people and the collective ownership system, two classes, the working class and the peasant class and that exchange was needed. But for a very long period after agricultural collectivization, Stalin did not explain or expound clearly whether the exchange between the two systems of public ownership was commodity exchange and whether the law of value could still be used. In this period, arguments about the above question kept going on in the Soviet Union. Until the latter years of Stalin, that is in 1952, he began to accept, in his book "On the Question of the Socialist Economy of the Soviet Union," that there were relations of exchange between commodity production and commodities in the two systems of ownership, and held that the law of value must be used. This was a conclusion after over 20 years of argument in the Soviet Union. In over 20 years prior to this, they did not fully use the relations between commodities and currency or the law of value, when handling the relations between the two systems of ownership.

In "On the Question of the Socialist Economy of the Soviet Union," although Stalin accepted that there were relations between commodities and currency in the two systems of ownership, at the same time he maintained that the means of production exchanged among state enterprises were not commodities. He further said that the law of value did not play a regulatory role even in the production of raw materials in agriculture. Stalin emphasized time and again that commodity production and the role of the law of value must be restricted. Therefore, we can say that Stalin never regarded or did not completely regard the socialist economy as a commodity economy, but to a very large extent, as a seminatural economy. According to this theory and understanding, the economic management system planned and carried out in the Stalin era did not comply with the requirements of the commodity economy but to the requirements of the natural or seminatural economy; Stalin did not regard products as commodities and did not carry out exchange at equal value, but unified regulation by planning mechanism while refusing to carry out regulation by market mechanism. He adopted highly centralized management methods with administrative means as the dominant factor. This unified regulation by planning mechanism regarded the whole national economy as a factory. Lenin also said such things as changing the whole society into a factory. But now this problem seems very complicated. Changing the whole society into a factory will bring forth many problems. The purpose of our carrying out the highly centralized economic management system and of our abolishing the relative independence of enterprises is to make the whole society a factory. Under such a system, have many problems not emerged?

Stalin's theory and practice have affected China's socialist construction tremendously. The pattern of the economic management system designed and implemented under his leadership has also affected China tremendously. If we want to change this pattern, we must first break away from the theoretical foundation of this pattern, that is to break away from some erroneous and outmoded conventions. Now we have already had a breakthrough in theory. We should say it is an important result of emancipating the mind. Without this theoretical breakthrough, we would not have been able to propose and implement the reform of our present system. Many comrades have realized that not only the means of existence, but also the means of production are commodities; that not only exchange between the sytem of ownership by the whole people and the collective ownership system, but also the exchange within the system of ownership by the whole people itself is a commodity exchange.

Due to theoretical progress, not only the means of existence but also the means of production may enter the market. For instance, the Anshan Steel Works has opened a store that sells steel. This has never happened before. The mechanical and electrical products that entered the market through this outlet in 1979 accounted for nearly 20 percent of its total output. It has been estimated that the percentage will be higher in 1980. Some factories' mechanical and electrical products that have entered the market even account for 70 to 80 percent. Some people do not agree with the practice of bringing the means of production into the market. But viewed from practical results, it has actively promoted the development of the economy. This also shows that the economic system must be reformed.

II. The Orientation and Requirements of the Reform of the Economic Management System

The reform of the economic management system must be based on our country's actual condition, that is to say it must be based on our country's special characteristics. What are these special characteristics? The most basic characteristic is: China is a large country with a population of 1 billion people, among which 800 million are peasants. A series of problems have emerged herefrom. First, China has a very poor foundation to start with, due to the long domination by feudalism and imperialism. Although there has been great development in China's economy since liberation, the national per capita income is just more than $200 on average. The average gross national product per capita in our country ranks lower than 120th among more than 140 countries and regions in the world. This is very low. Take the agricultural population as an example. In 1979, the average income from the collective was only 83.4 yuan per person. In 27 percent of the production teams, the average income for each person was less than 50 yuan. Although the urban people earn a little more than the people in the rural areas, they are not well-off. A large population has large consumption and accumulation is confined within strict limitations. During the 30 years since the founding of the People's Republic of China, the average net increase of people has been 14 million per year. The average net increase of the agricultural population has been 11.6 million people per year. Even if family planning is implemented and the natural growth rate drops, there will be an increase of 12 million people per year in the future. Calculated according to the present consumption level, there will need to be an increase of consumption funds of 3 billion yuan, 6 billion jin of grain and 300 million meters of piece goods per year. Only when we have met the basic demands of the newly increased population with the yearly increased products, can we talk about improving the livelihood of the original population and can we talk about new investments. Second, China's commodity economy is not well developed. Although collectivization has been realized and the collective ownership system was established in the countryside long ago, its economy is fundamentally still a natural economy, its labor productivity and the commodity rate of its agricultural products are very low. China's main agricultural products are grain and 80 percent of the grain is consumed by the peasants themselves. After deducting the part of the grain resold by the state, the average commodity rate throughout the country is only about 15 percent. Of course, different regions have different rates. For instance, the commodity rates in the grain producing regions and the commodity grain bases are a bit higher. Commodity rates in the regions of industrial crops are also a little higher. But the surplus agricultural products yearly provided by each agricultural laborer are not worth more than 80 yuan, even though the prices of agricultural products have been raised. China's urban commodity economy is not well developed either. Because of the influence of the natural economy, we have not carried out well cooperation among specialized units, instead we have been keen on being "large and complete," or "small and complete." Therefore, the original production of socialization has become a natural economy that is self-sufficient or semiself-sufficient. Another point is that the development of China's economy in uneven. There are many large cities in China in which the economy is comparatively developed. Shanghai is such a city, which is about the same as New York, Paris and Tokyo. Of course, it is not as modernized as they are. Most of the regions in China are not highly developed. There are a few backward regions which still adopt slash-and-burn cultivation. If the world is divided into developed regions, developing regions and underdeveloped regions, then according to the level of development of the economy, our country can also be divided into comparatively developed regions, developing regions and comparatively backward regions. One more point is that the technological structure in production is multistratified. There is automation, semi-automation, mechanization and semi-mechanization. But most of the work is done by hand. The social economic structure is also multistratified. There is the system of ownership by the whole people, the collective ownership system, the individual ownership system, the combination of the system of ownership by the whole people and the collective ownership system and the state capitalist system of ownership of joint ventures. Have we not said that we must not deal with things indiscriminately? It is true, we must not, because various regions and various economic situations differ in a thousand and one ways.

To have a correct understanding of the country's situation is very important. We must solve this problem not only in the reform of the economic system but also in the whole socialist construction. Comrade Chen Yun recently said: "Our country has a population of 1 billion people, among which 800 million are peasants. We are carrying out construction in such a country." We must understand this and pay attention to this difficulty. But there are not many people who soberly understand this. The most fundamental reason why we have met with so many setbacks and committee left deviationist mistakes in our socialist construction is that we lack a sober understanding of our country's basic condition.

Starting from this actual condition, the principles and orientation of the reform of our economic management system are, by holding on to the condition that the system of public ownership of the means of production occupies a dominant position and in accordance with the requirements of developing the commodity economy and promoting large-scale socialized production, to conscientiously use the law governing the economy, to break away from the administrative conventions and the ideological trammels of the natural economy and change the highly centralized state policy system into a combined policy system of the state, the economic units and the individual laborers with the state as the main component part; to change the unified planned regulation into correctly bringing into play the role of regulation by market mechanism under planned guidance; to change the economic management that mainly relies on administrative institutions and administrative methods into economic management that mainly relies on economic organizations, economic methods and economic laws and regulations in order to bring the initiative in various sides into play, rationally organize various economic activities and accelerate the building of socialist modernization with minimum consumption of labor and maximum economic effect.

First, we must change the highly centralized state policy system into a combined policy system of the state, the economic units and the individual laborers with the state as the main component part.

Our present economic system is basically worked out by the state. Enterprises have little decisionmaking power, and the powers of individual laborers are also limited. The purpose of expanding enterprise, autonomy is to let the enterprises have the necessary decisionmaking power. In addition, individual laborers should also have the necessary decisionmaking power.

Individual decisionmaking power generally includes two aspects. One is allocation, that is how to use salaries and rewards. This should not be controlled by the state. They should be allowed to buy what they like to buy (what is meant here is mainly consumer goods). But under our present economic system, individual laborers' decisionmaking power is also limited to a certain extent. For instance, some of our products are available only by coupons or tickets, even if you have money, it does not mean that you can buy what you like. Recently, we conducted an investigation in Guangxi. The peasants of Nanning, Liuzhou, Guilin and Wuzhou want to buy bicycles and sewing machines made in Shanghai, but they are not available. In many places, people have to draw lots or use coupons to buy bicycles or sewing machines. To use coupons shows that our commodities are not abundant and are in short supply. Under such circumstances, we have to adopt methods that can guarantee the most fundamental needs of everybody. This is not the characteristic of socialism nor the method that must be adopted in socialism. Under this method, the individual laborers' right to allocate their income is limited. Only when the economy has really developed and is really brisk and there is sufficient supply of commodities, will there be room for personal choice in the purchase of commodities. Therefore, we must develop the commodity economy, enliven the economy and make the individual laborers fully realize their right to make decisions in this respect.

The other aspect of individual decisionmaking power is personal choice of occupation. Our constitution stipulates that each citizen has the right to work. But in the choice of occupation, each individual has little right to decide. In our present labor management, the state carries out unified arrangement and allocation. If you go to the labor bureau for a job, assignment, you will be required to work in whatever place is assigned by the labor bureau. It is no easy matter to find a job and it is even more difficult to choose a suitable one. The socialist principle is from each according to his ability, to each according to his work. From each according to his ability means to bring into play everyone's talents and given them the most suitable work to do and to that end, to let everyone have the right to choose the occupation they like. In the past, it was out of the question for us to talk about decisionmaking power. In the reform of the economic system, the grip on the above problem is rather loose. In other words, cadres and workers are allowed to make their choice or change their work within certain limits. This is beneficial to our economic development. Of comrse, our country has a large agricultural population and there is a great difference between the cities and the countryside. Therefore the state has to exercise the necessary control over the allocation of the labor force. But being the orientation of reform, individual laborers should have a certain right to decide in the above two aspects.

The enterprises should also have the necessary decisionmaking powers. The reason for expanding enterprise autonomy is that the enterprises are in need of the necessary decisionmaking powers. The trial-point enterprises that are now carrying out expansion of autonomy have obtained some rights in respect of retaining profits. But there are many irrational limitations as to how to allocate the retained profits. In production and marketing, personnel matters, the arrangement of work and planning, the enterprises still do not have enough autonomy. Within the limits permitted by state decrees and under the planned guidance of the state, the above various right limitations should be expanded step by step so as to give the enterprises the necessary decisionmaking powers.

The power for macroeconomic planning should be kept in the hands of the state. That includes the orientation for developing the national economy, the main proportions, the scale of capital contruction, the orientation of investment, major construction projects and the rising range of the people's livelihood. For instance, the state should decide how much of the increase of the national economy should be used for accumulation and consumption, how much of the accumulation should be used for capital construction and on what scale the capital construction should be carried out. In the first 5-year plan, the proportion of accumulation in the national income was less than 25 percent and the proportion of consumption was a little more than 75 percent. Life at that time was good. During the "great leap forward," the accumulation rate was as high as over 40 percent. In 1978, the accumulation rate was also very high. It was over 36 percent. Because the accumulation rate was excessively high for a long time, more and more problems emerged in the livelihood of the people. In the 20 years from 1958 to 1978, there was little improvement in the people's livelihood. This was because of the wrong handling of the relations between consumption and accumulation. If we had made accumulation a little less and consumption a little more, there would have been improvement in the people's livelihood. The correct policy of the state in macroeconomics is very important. Summing up past experience and lessons, we know we must correctly handle the relations between accumulation and consumption and the relations between construction and livelihood. For instance, we must have an accurate calculation on the increase of major products, revenue and expenditure, salaries, on the scale of capital construction and on how many coupons are to be issued. We must carry out well an overall balance in finance, credit, material, foreign remittance and accumulation and consumption. Otherwise, it will have an advanser effect on the development of the economy or it may even make a mess of the economy.

Second, we must change the unified planned regulation into fully bringing into play the role of regulation by market mechanism under the planned guidance of the state.

Since we have admitted that the socialist economy is a planned commodity economy, we must correctly bring into play the role of regulation by market mechanism under the planned guidance of the state.

Because the socialist system of public ownership occupies an absolutely dominant position and because the state's political power is in the hands of the workers, peasants and the representatives of the laboring intellectuals, the basic social needs can be controlled. This is why there is the objective possibility of carrying out planned guidance in the national economy. For instance, the state can control the proportion between accumulation and consumption in the national income, the scale of the country's construction and the rising range of the people's livelihood.

Of course, when carrying out regulation by planning mechanism, the state should not interfere in the enterprises' activities too excessively by administrative means. Instead it should pay attention to using economic levers such as taxation, prices and profits to carry out regulation. Under the prerequisite of holding on to the principle of carrying out the planned economy, we should correctly bring into play the role of regulation by market mechanism. This will help the national economy maintain its equilibrium persistently and conscientiously and avoid serious disproportion.

In view of the present situation in our country, the state's compulsory plan is indispensable. There must be compulsory indices for the production and allocation of some major products that are related to the national economy and the people's livelihood, such as grain, piece goods, coal, electricity, oil, steel and full sets of equipment. But at the same time the necessary economic means must be used as a supplement. The items, sizes and designs and colors of these products should be decided by the producers and the buyers. Production must be decided according to demand.

For most of the products, the state may set guiding indices instead of compulsory ones so as to let the enterprises have direct contact with the consumers and sign supply and sales contracts with them. On this basis, plans will be worked out and submitted to the department concerned for approval. In this respect, the state's responsibility is to provide the enterprises with market information and reference indices, given them instructions that they should correctly fix the development orientation of production and lead them by means of economic levers.

Third, we must change the economic management that mainly relies on administrative institutions and administrative methods into the economic management that mainly relies on economic organizations, economic methods and economic laws and regulations.

Only in this way, can the enterprises become relatively independent economic units that are no longer subordinate to the departments or the administrative institutions of the localities, and can they change the situation of "big and complete" and "small and complete." Only when we organize the enterprises according to the principle of cooperation among specialized units and of economic rationality, can we change the situation in which the national economy is divided into administrative departments and can we form a unified national economy in a planned and proportionate way. Only in this way, can we organize various economic activities in accordance with the requirements of the objective law governing the economy in order to achieve the best economic results.

It should be pointed out that, by criticizing the past economic management that mainly relied on administrative methods, this does not mean we should not adopt administrative means and methods any more. Under any circumstances, administrative methods are necessary to lead the national economy. The problem is administrative methods must be correct. In other words, they must comply with the requirements of the objective law governing the economy and at the same time be combined with economic methods. Especially at the present readjustment stage, it is all the more important to pay attention to the role and significance of administrative methods, because the national economy is seriously disproportioned and the role of many economic measures and levers has not been brought into full play. During the process of reform legislation cannot keep pace with the demands immediately and no complete set of economic means can be realized immediately. In addition, there is a distinct element of time involved in the readjustment period, so administrative methods are more effective than economic methods insofar as solving some problems is concerned. For instance, it is necessary to adopt administrative means in order to effectively prevent the tendency of blind construction and duplicate construction and resolutely carry out closing, suspending, merging and shifting in the enterprises that have incurred losses for a long time and consumed raw materials and energy to excess. Therefore, it will take time to change from economic management that mainly relies on administrative methods into economic management that mainly relies on economic methods. We must resolutely further enliven the economy, but we must also pay attention to administrative methods. The state must interfere in problems that are of great importance. We must combine well these two aspects and guarantee the smooth realization of the task of readjustment.

By carrying out such a reform, does it not mean that we are changing the socialist system of public ownership into the capitalist system of private ownership? No. Not only will such a reform not change the socialist system of public ownership, but it is beneficial to the consolidation and development of the system of public ownership. There is a fundamental difference beteen the capitalist commodity economy and the socialist commodity economy, that is, whether or not the labor force is a commodity. In the economy of the socialist system of public ownership, the labor force is not a commodity. At the present stage, we permit the existence and the limited development of the individual economy, because it is a subordinate and a necessary supplement to the socialist economy. It is also permissible to employ some apprentices in the individual economy. From the Marxist point of view, to employ a limited number of apprentices cannot be branded as capitalism. In his "Das Kaptial," Marx did some calculation. According to the situation at that time, to be a capitalist, one had to employ eight workers so that one did not need to take part in labor and could live by exploiting the surplus value of the workers. Now when we consider this question, we must base ourselves on the present situation. But to allow handicraftsmen to employ several apprentices does not after all mean that the labor force has become a commodity. Another difference between the socialist economy and the capitalist economy is whether money has become capital. In our socialist economy, money does not become capital. In joint-venture enterprises, foreign capital is allowed in China for the purpose of accelerating China's socialist construction. However, the socialist economy still occupies a dominant position in the whole national economy. The above shows that what we uphold are the Marxist line and the socialist orientation.

III. Some Thinking on the Pattern of a Chinese-style Socialist Economic System

After having been reformed, the pattern of our country's economic system is a Chinese-style socialist economic management system that is based on our country's actual condition. The general outline of this system mainly includes the following five points. First, expansion of enterprise autonomy, second, is carrying out various forms of economic integration, third, set up trade organizations, fourth, take developing the economy as the center, fifth, change the functions of administrative management institutions.

First, separate government from enterprises, delegate power to the lower levels and expand enterprise autonomy. This is the foundation of the reform of our whole economic system. On the whole it includes three requirements:

(1) Economically, under the condition that the enterprises have fulfilled the tasks put forward by the state, they may carry out independent accounting and adhere to the principle of responsibility for their own profits and losses so as to become relatively independent economic units that have internal motivation, external pressure and great vitality.

Enterprise autonomy must be expanded to the extent that they can carry out independent management and activities and so that they have independent accounting and responsibility for their own profits and losses, after having fulfilled the tasks put forward by the state. China's present socialist economy is still a commodity economy and enterprises are commodity producers and are the basic units that can directly give play to the role of production and exchange. Under the unified leadership of the state, the enterprises should have independent management and relatively independent economic interests. In this way, the enterprises can become dynamic organisms, can become economic cells that are full of vitality and can become the source of strength of the national economy.

By carrying out the principle of independent accounting and responsibility for their own profits and losses, will the nature of the system of ownership by the whole people be changed? I do not think it will. In the past, the fixed assets and circulating funds of the system of ownership by the whole people belonged to the state and were used gratuitously by the enterprises. Now the enterprises have become relatively independent management units, so the fixed assets and circulation funds are used with repayment liabilities but still belong to the state. The enterprises only possesses and use them and the nature of the system of ownership by the people has not changed. The right to use and the right to own can be separated under certain conditions. After the October Revolution, Lenin said that the land belonged to the state and could be possessed by those who cultivated it. He said it was not the transfer of ownership rights but the transfer of allocation relations. Lenin once proposed to rent some of the state factories to foreign capitalists, which was to be called state capitalism. This is the separation of the right to own and the right to use.

When the enterprises under the system of ownership by the whole people carry out the principle of independent accounting and of responsibility for their own profits and losses, do the new fixed assets formed by self-accumulated funds belong to the system of ownership by the whole people? This problem merits deeper study. In my opinion, the new fixed assets formed by self-accumulated funds of the state enterprises should still belong to the system of ownership by the whole people. But to encourage the enterprises to tap their potential, renovate, restructure and expand reproduction by means of self-accumulated funds, the state should not charge them for the use of the new investments for a given period. After a given period of 3 to 5 years, the state may reduce the cost. In this respect, the fixed assets are treated in a different way from those of the original system of ownership by the whole people. If the enterprises are required to pay the same cost as that paid for the use of the fixed assets of the original system of ownership by the whole people, then the enterprises' initiative for exapnding reproduction will be affected.

In addition, the self-accumulated funds of the enterprises under the system of ownership by the whole people may be used for tapping their own potential, renovating, restructuring and expanding construction. If they have some funds left, they can use them for investment in other enterprises (whether they be enterprises under the system of ownership by the whole people or enterprises under the collective ownership system) and carry out joint management with them, on a voluntary basis and under the principle of mutual benfits. We should make a study of the nature of the ownership of investments in enterprises under the system of ownership by the whole people should belong to the system of ownership by the whole people. The case is different with investments in enterprises under the collective ownership system. This is the combination of the self-accumulated funds of the enterprises under the system of ownership by the whole people with those of the enterprises under the collective ownership system. It is a new economic form. The state should also give economic encouragement to such investments, besides giving planned instructions. The state may reduce the tax on the income from the investments of the enterprises under the system of ownership by the whole people within a given period of say 3 to 5 years. Otherwise, the enterprises will lose their initiative for investment. Besides, if all of the income earned by the enterprises under the system of ownership by the whole people from the investments in other enterprises is used for the development of production, the initiative of the staff and workers will be affected. It seems that it is necessary to use some of the income for the enterprises' welfare. We should know that the form of the socialist system of public ownership may change. Socialist production relations are based on the system of public ownership of the means of production. This definitely cannot be changed. But there are various forms of public ownership systems and we must not be rigid in our attitude towards them. For instance, now we have a new economic form in which the system of onwership by the whole people is combined with the collective ownership system.

This combination has brought good economic results. Can you say this is irrational? Or can you say this is not the socialist economic form? We must further study which form of public ownership system is more suitable for the development of the economy.

(2) Politically, the staff and workers have become masters of their own house and can carry out democratic management, so they love their factories like their own homes and a "community of destiny" has emerged in which the staff and workers maintain flesh-and-blood relations with the enterprises. This is like what was described by Engels as the combined body of free and equal producers.

The expansion of enterprise autonomy must be combined with the expansion of the workers' rights to become masters of their own house. This is one of the fundamental differences between our system and the one-man leadership system of the Soviet Union. We emphasize that the factory director exercises the right to direct production, but major problems of the factories and enterprises must be decided by the workers themselves. Only in this way, can the workers become the masters of the enterprises.

If we want our enterprises to resolutely take the socialist road, we must fully develop the socialist democratic style of work in the management of enterprises so as to make the laborers really become the masters of the means of production. Marx once made the following prediction as regards socialism in future: "The nationwide centralization of the means of production will become the nationwide social foundation formed by the combined body of free and equal producers, who will conscientiously undertake social labor in accordance with the common and rational plan." (Marx: Collected Works of Marx and Engels, "On the Nationalization of the Land," vol 18, p 67) What we want to build step by step is such a society. The system of ownership of the means of production is not just a question of who possesses, but also a question of who allocates. Only by transferring the allocation right to the producers on the production front (including management cadres, technicians and workers), can we better utilize the means of production of the system of ownership by the whole people for developing production, in order to make various measures practical, bring into play the initiative of the direct producers, emancipate the productive forces and give full play to the superiority of socialism. Therefore, to set up staff and workers' congresses and their standing institutions that have sufficient power is of great significance and is an important reform in the leadership system of enterprises.

The staff and workers' congresses should have the following power in respect of the enterprises' production, and management activities: Under the state's planned instruction, the congresses will work out the enterprises' long-term and short-term plans, determine the plan on major technological reforms, examine and approve the budget and finalize accounts and adopt important rules and regulations after the enterprises pay the tax to the state, the congress will decide on the allocation of the results of the work, that is expansion of reproduction, collective welfare, wages and rewards and the allocation of reserved funds according to the state's policies and decrees; the congress can decide on the appointment and dismissal of the enterprises' main cadres, according to the state's policies and decrees. If the staff and workers want to really become the masters of the enterprises, they should have the power to decide on the above major problems. That is to say that the staff and workers' conference and congress should not be regarded as merely organizations to absorb the workers to "participate" in management, or at most as organizations for inquiries and inspection. Starting from the prerequisite that the staff and workers should be the masters of enterprises, we should make staff and workers' conferences and congresses play the role of the organ of power. As members of the working class, the staff and workers are not only the masters of enterprises, but also the masters of the state and society; they will not only manage the enterprises, but also take charge of the state's political, economic and other social affairs. For the staff and workers to manage the enterprises is the foundation for taking charge of the state's political, economic and other social affairs.

(3) In the leadership and management system, we should adhere to the responsibility system of the factory director being in charge based on democratic management. Opinions are not yet completely identical as to what the responsibility system of the factory director being in charge is. Some comrades propose carrying out the responsibility system of the factory director being in charge under the leadership of the staff and workers' congress, others propose carrying out the responsibility system of the factory director being in charge under the leadership of the management committee of the enterprises, and still others propose carrying out the responsibility system of the factory head being in charge under the leadership of the party committee, except for a few trial-point enterprises and until the party Central Committee makes new decisions.

In reviewing out history over the past 30 years, there have been three great reforms in the leadership and management system of our industrial enterprises. In the beginning it was called the party committee system. The method adopted by the revolutionary base areas in 1942 whereby the party, the government, the army, the civilians and the students should be unified under the party leadership was introduced in the management of enterprises. Recently, some comrades pointed out that the decision on unified leadership was quite necessary for winning a revolutionary war during a war period and that it was correct. But our practice in the past 20-odd years has proved that it is not appropriate for the method to be applied without any change in the four modernizations drive, especially to be applied in factories. For a period of time after liberation, we used this method and later changed it to the responsibility system of the factory director being in charge because we felt it was not so suitable for modern large-scale production. During the implementation of the responsibility system of the factory directors of some enterprises had excessive power and that the party committee and mass organizations could not play their role well. In order to overcome these shortcomings, the system was criticized in 1956, that is, the one-man leadership system was criticized and changed into the responsibility system of the factory head being in charge under the leadership of the party committee. This system has been implemented for 24 years. Practice has proved that this system has a lot of shortcomings and it has even changed into the one-man leadership system of the party committee secretary, under which the party committee decides on everything. The factory director, the staff and workers' congress and engineers have lost their functions. Of course, when the socialist transformation of the means of production had not been completed and when the contradictions between the proletariat and the bourgeoisie were still the main contradictions, the responsibility system of the factory director being in charge under the leadership of the party committee was specifically suited to the situation and tasks at that time. It once played a positive role. But following the shift of the stress of the party's work to socialist modernization and following the unfolding of the reform of the economic management system, many problems have emerged. This system must be reformed step by step and in a planned way, but the responsibility system of the factory head being in charge under the leadership of the party committee has to be implemented until trial points are carried out, experience is ripe and the party Central Committee makes new decisions.

The party committee system, the responsibility system of the factory director being in charge and the responsibility system of the factory director being in charge under the leadership of the party committee have common shortcomings, namely, the staff and workers (including production workers, cadres and technicians) have not really become the masters of enterprises and have not developed the democratic style of work. This is an important reason why the leadership system of the enterprises must be improved.

No matter what method is adopted in the reform of the leadership and management systems of industrial enterprises, the following targets must be achieved: First of all, we must overcome the disadvantages of mixing the party, the government and the enterprises toegether and really intensify and improve political and ideological leadership exercised by the party over the enterprises. Second, we must exercise democratic centralism in the management of enterprises so as to make the broad masses of staff and workers really become the masters of enterprises and work hard for running the socialist enterprises well with a full sense of responsibility. In addition, on the basis of democratic management, we must form a centralized and unified system headed by the factory director (manager) and a responsibility system of the factory director being in charge that carries out production technology and management, in order to meet the objective demands in modern large-scale socialized production and achieve good economic results.

In order to realize the above-mentioned economic and political demands, enterprises should carry out the following six changes in their economic management:

(1) They should change the enterprises from being appendages of the departments and the administrative institutions of the localities into economic units which are responsible for their own profits and losses and which can form an independent production and economic management system and be fully responsible for their management results. The separation of enterprises from administrative organs means the changing of the profits turned over to the state into taxation. In taxation, the center and the localities can carry out appropriate allocation to prevent each from being unwilling to let go of the enterprises.

(2) They should change the enterprises from organizations which are in need of vitality into economic units which have internal motivation and external pressure and in which how the enterprises are run is directly connected with the interests of the staff and workers. When the enterprises carry out democratic management, the personal interests of the staff and workers are directly connected with the management results of the enterprises. In this way, the enterprises can have internal motivation. The enterprises are to carry out competition so as to have external pressures. With motivation and pressure, the enterprises can advance in a better way.

(3) They should change the enterprises from units which simply carry out orders into units which can make their own decisions. Except for some necessary planned

guidance, the state's plans should be worked out in such a way that they will gradually become of a guiding nature instead of compulsory. Our country is so large and our enterprises are so many. How should concrete and meticulous arrangements be carried out in every enterprise under the state's plans? Of course, the state's interference and guidance are necessary. But the enterprises should be allowed to make their own decisions according to the market situation under the state's planned guidance.

(4) They should change the enterprises from being "large and complete" or "small and complete" economic organizations into economic organizations in which specialization is combined with cooperation.

(5) They should change the enterprises' pattern of just being engaged in production into that of being able to manage production. The enterprises should pay attention not only to production but also to marketing, not only to management but also to the way of doing business and not only to their plans but also to the market. So new requirements are constantly set to the enterprises' management personnel, and they are impelled to adopt new attitudes toward production and new methods to organize production and pay attention to the market situation. They should learn how to engage in competition.

(6) They should make the enterprises responsible not only to the higher authorities but also mainly to the consumer.

The above are the changes the enterprises themselves will undergo after they have expanded their autonomy. In 1981, the enterprises will formally carry out the principle of independent accounting and responsibility for their own profits and losses in their trial points, but these trial points should not be carried out on a large scale. As to the retention of profits, some comrades think that only the enterprises which have a lot of profits can retain them and that the enterprises which have little profits or which in our losses cannot do that. This viewpoint merits careful consideration. From Sichuan's experience we know that the enterprises which have little profits or which incur losses can improve their management by carrying out the principle of retaining the profits or of being responsible for their own losses. Experience in some other districts has also proved this. Recently, I went to Liuzhou in Guangxi for investigation. From 1966 to 1979. tke Liuzhou iron and steel works incurred a loss of 180 million yuan. In 1978, it incurred a loss of 15 million yuan and in 1979 8.73 million yuan. In 1980, the party committee of the Guangxi autonomous region adopted a financial method of being "responsible for their own losses, no replacement for serious losses and of retaining what they have when losses are small." As a result, this works soon overcame its losses. From January to October, it neeted a profit of 2.85 million yuan. It is obvious that this method brought very good results.

Of course, trial points should not be carried out in an isolated way. The planning units, statistics units, material units, taxation units, banking credit units, pricing units, commercial units, foreign trade units, labor and salary units, organization departments and personnel departments should all take part in them. Because the reform of a system involves many problems, without the participation of various units concerned, these problems cannot be solved well or cannot be solved at all. The trial pints of paying "substituting taxes for profits and of being responsible for one's own profits and losses" are carried out in some places only by relying on the financial bureau and the tax bureau. How can they carry out the trial points well? Many enterprises have complained that they are in need of the right to use and transfer personnel. It seems that the organization department and personnel department of the party committee should also take part in the trial-point expansion of autonomy.

Second, on the basis of expanding enterprise autonomy, it is necessary to organize tens of thousands of scattered enterprises to form economic integration of various forms and to set up economic integrated bodies and all kinds of companies. Economic integration should be carried out on a voluntary basis and under the principle of mutual benefits. We should combine the method of from bottom to top with that of from top to bottom. There are various forms of integration, namely, the integration among enterprises under the system of ownership by the whole people, the integration among enterprises under the collective ownership system, the integration between enterprises under the system of ownership by the whole people and enterprises under the collective ownership system, integration among provinces, integration between China's enterprises and foreign enterprises, integration of production processes, integration of circulation processes, integration between raw materials and technology, integration of funds, integration of transport, integration among enterprises and integration between one economic integrated body and another. Various forms of integration are beneficial to the horizontal relations of the economy and will enliven our economy.

It is necessary to conscientiously study the major problem of how the socialist enterprises should rationally get organized, give full play to their potentials and superiority. Two years ago we had an idea of establishing nationwide or regional specialized companies and comprehensive companies from top to bottom, in order to unify various enterprises under the leadership of such companies. Now it seems that it is difficult to establish in a very short time. The form of economic organization is determined by the level of development of the productive forces. China's present production has not reached a high degree of socialization and the development of production in various regions, various departments and various enterprises is not even. Under such circumstances, it is not suitable to organize in a short time all the enterprises under the leadership of specialized or comprehensive companies in which manpower, financial resources, material resources, production, supply and marketing are highly centralized. If we do not start from practice or consider the demands of the development of production and the ecnomic effect, but indiscriminately adopt the method of centralizing all the enterprises under the leadership of such companies from top to bottom, it will inevitably mean "the same old stuff with a different label," and the companies will become administrative organizations in a covert form. Thus the administrative structure will be made more complicated, bureaucratism will be fostered and the target of promoting economic development will not be achieved. Practice has proved that this method has many drawbacks. First, such companies are highly centralized, so monopoly and suffocation of competition will easily emerge; second, power is liable to be centralized by the companies, the enterprises will be deprived of their recently earned autonomy and their initiative will be seriously affected; third, the orginal horizontal economic relations among enterprises are liable to be cut off, and if enterprises want to carry out cooperation, they have to go through the companies of a higher level to get in touch with each other, even though the enterprises are close at hand; fourth, economic results are liable to be ignored. An example is the northeast agricultural machinery company which was set up in March, 1978. It consisted of 144 factories which carried out cooperation over a wide area of 3.3 million square kilometers. The farthest distance was thousands of kilometers away and 20 percent of the factories were not along the railroad line. As a result, the cost of each tractor was as high as 15,000 yuan, while the cost of a similar product of the Tianjin tractory factory was only 9,000 yuan.

Practice has once again proved that forming economic integration by means of various forms, forming various economic integrated bodies and carrying out rational cooperation among specialized units on a voluntary basis and under the principle of mutual benefit are beneficial to giving full play to the enterprises' superiority, unfolding competition and accelerating economic development. Since 1980, enterprises in Sichuan and other provinces have taken the road of forming integration of their own accord and carrying out various forms of economic integration. There have been many advantages. First, the superiority of various economic units can be brought into full play and the economic results promoted. Second, they are helpful to linking up the horizontal economic relations and breaking through regional blockade and partial separation. Third, they are beneficial to the realization of cooperation among specialized units and to avoiding unnecessary duplicate construction and blind production. Fourth, they are beneficial to attracting the financial resources of enterprises into the urgent demands in economic construction. Fifth, this economic integrated body does not exercise monopoly but competition towards the enterprises outside this body; it does not deprive the various enterprises under this integrated body of their autonomy but respects their independent accounting and their power to carry out the principle of responsibility for their own profits and losses. Therefore this integrated body has internal motivation and external pressure. On the whole it has great vitality. It is just because the integrated body has many advantages that joint enterprises in various places have emerged and developed one after another after the central authorities put forward such a suggestion. In the first half of 1980, in Shanghai alone, 140 joint enterprises of different types were set up in 3 undertakings of light industry, textiles and handicrafts. Notable economic results were achieved. For instance, the joint enterprises run by Shanghai's handicrafts generally can start production 2 or 3 months after the signing of a contract. Production capacity is formed half a year later and they can recoup capital outlay within a year. Joint enterprises are run mainly by using production capacity now available. No new capital construction projects are carried out. This is an important experience.

The carrying out of economic integration should be based on the whole economic situation and social demands. We should combine administrative means with economic means. We should combine the method of making decisions from bottom to top with that of making decisions from top to bottom in order to achieve the target of increasing production and promoting economic results.

Third, set up a nationwide or regional trade organization, which may be called an association or federation. In the past there were the so-called 72 trades, meaning all sorts of trades. Take the textile industry as an example. There are the cotton textile industry, silk textile industry and woolen textile industry. In order to get them organized, we may form a federation or association for the textile industry. If we want to go into further details, we may divide the cotton textile industry and the silk textile industry. Trade organizations should be civilian organizations or semigovernmental organizations under the guidance of the government. They should not be administrative organizations, which interfere in the internal affairs of the enterprises. They should cooperate with the enterprises in solving the problems that emerge among trades of the same type. The main tasks of the trade organizations are to handle the affairs of individual enterprises and companies which they are unable to handle, and serve the trades and enterprises themselves, according to the government's policies, decrees, laws and plans and according to the needs in the technological and economic activities of the enterprises when organizing production. The main functions of these organizations are (1) to carry out investigation among enterprises and market analysis, and according to the state's development plans for the economy, work out medium and long-term development plans and annual plans for the enterprises themselves. (2) To collect, arrange and provide information concerning domestic and foreign technological development and market demands to improve the enterprises' management. (3) To link up the connections and relations among enterprises in the same line of business, organize and coordinate cooperation within the enterprises themselves and organize competition and public appraisals in the enterprises. (4) To work out the standards of enterprises and products. (5) To coordinate the quality of products for export and their prices. (6) To give instructions to the management of the enterprises. (7) To help the enterprises train management personnel and technicians. (8) To reflect to the government in a timely manner how the enterprises' production is operated and put forward the requirements and suggestions for the development of the enterprises.

Trade organizations are quite in vogue in capitalist countries. This organizational method is adopted even in Yugoslavia and Romania. According to the investigation by a Chinese delegation on Japan's trade management, we know that in 1978, the number of various trade organizations set up by medium and small enterprises in Japan was 55,000. These organizations have been pushing forward the cause of trades in the same line of business. The enterprises may join or withdraw of their own accord. Those which join the organizations are still enterprises which can run business independently. Generally speaking, trade organizations in Japan exercise their functions of making connections, giving instruction and providing service information on the basis of running the enterprises independently and on their own. It seems that the method of giving instruction to enterprises' activities through trade organizations is better than that of exercising leadership over enterprises by simply relying on administrative organizations. The civilian and semicivilian organizations which are composed of trade experts who join the trade federation or association, can undoubtedly play a very positive role in developing the economy. They can serve not only every enterprise of the same line, but in the first place the economic integrated bodies. They can promote the development of the economic integrated bodies and push forward the reorganization of enterprises according to the principle of combining specialization with cooperation. This is beneficial to the readjustment work now being carrried out. We may choose some trades for trial.

Fourth, develop economic centers which have the backing of industrially and commercially developed large cities. Guangzhou is a large economic center. Economic centers have not emerged accidentally, they are the results of a long historical process of economic development. In return, they play a very important role in pushing forward the development of the economy. They are often the centers of industrial production, the trade centers where commodities are purchased and sold, the communications and transportation centers, financial centers and scientific, technological, cultural and educational centers. All large cities in the world play the role of economic centers. Economic centers do not form or disappear according to man's will, but according to economic laws. Therefore, we should pay attention to the role of economic centers.

The problem of how to bring into full play the role of economic centers is worth studying. Some comrades have the following ideas: In order to bring into full play the role of economic centers, it is necessary to form several economic centers throughout the country with the support of industrially and commercially developed large cities according to the requirements of the economic laws. Every economic center may have several medium or small economic centers with medium or small cities as their main component part. They are to be connected with medium or small towns and the countryside. Economic centers must not be under the restrictions of the administrative region. They should unfold economic activities according to the natural economic relations and under the principle of achieving the best economic results. The activities of various economic centers may be interwoven and interrelated in order to gradually form a flexible organism which has a network structure. We must develop medium and small towns in a planned way. If only large and medium cities exist and small towns are not developed, the countryside will have no legs. If the commodity economy of the countryside is cut off from small towns, it is hard to develop in an isolated way, and the development of the economy of small towns will in return promote the development of the diversified economy in the countryside. The proportion of population between the cities and rural areas is 20 percent to 80 percent. When the economy has developed 20 to 30 years later, the proportion of population between the cities and rural areas may be 30 percent to 70 percent or 40 percent to 60 percent. Suppose it is 30 percent to 70 percent, more than 100 million people will have to leave the countryside. Where will arrangements be made for them? We must be able to predict that the arrangement will be made for them in small towns.

Economic centers themselves also have the problem of how they should be constructed well. Only when economic centers are run well, will people join. If they are run in a bad way, people will not come. In order to bring into full play the role of economic centers, we must do a good job in supply, communications, harbor service and equipment, transportation, hotel service and equipment, information service and telephone and telegraphic service. When people come to your place for economic activities, they will know the situation once they inquire. Because the cities are short of inquiry services, it is hard to find out about the market situation. When foreigners come to Beijing on business, they are beset with difficulties. After staying in Beijing for 20 days or a month, they still do not know whom to get in touch with for a business interview. If only there were an inquiry service. In Sichuan, an inquiry service has been set up by several youths who are awaiting employment. The service is very lively. There is also such a service in Shenyang. If we want to give full play to the role of economic centers, we must set up inquiry services, which will be aimed at knowing about not only the econmic situation in our own region, but the economic situation in other regions as well. People in Guangdong should at least know about the situation in Hong Kong and Macau. The year before last, when I visited Hong Kong, I saw an inquiry company which had immediate access to knowledge of the gold prices in London, New York and other places through electronic monitoring. Every day it sent out to its customers reports on the commercial situation of various places in the world, such as the prices and marketing of cotton, grain, piece goods and other commodities. It also knew very well the changes of exchange rates of various currencies. Our economic centers must gradually set up inquiry services and economic information institutions.

Fifth, the functions of administrative management organs must be changed. After the expansion of enterprise autonomy, economic integrated bodies and trade organizations are formed and the role of economic centers is brought into full play, what kind of change will be responsibilities of the economic administrative departments undergo? Some people worry that after such a reform, the administrative management departments will have nothing to do any more. In fact, nothing of the sort will take place. Our administrative management departments will have more, not less, to do, will have heavier, not lighter, tasks to shoulder and will have higher, not lower, requirements for the level of leadership. In future, governments at all levels will guide and manage the economy by means of laws, policies, planning, plans and economic levers, instead of directly interfering in the internal affairs of the economic units, as is done now. For instance, we will guide the development orientation of the enterprises through planning, support the enterprises in carrying out urgent undertakings of the state through bank credit, encourage or restrict the development of some enterprises, readjust production and marketing through prices and taxation and readjust the profits and disparity between suffering and happiness among the enterprises. We are unfamiliar with the above work and are short or such experience and knowledge. For instance, we also pay taxes, but the tax rates have not played their appropriate role. Of course, we cannot say that it does not play its role at all. It plays a very positive role in the national revenue. But it has not played enough of a role in pushing the economy forward. Do we not want to substitute taxes for profits? We have no experience in carrying it out. In the past we did not have income tax, now trial points are being carried out in some places in which one enterprises has one tax rate. China has more than 370,000 industrial enterprises, does this not mean that there should be 370,000 tax rates? Obviously that is impossible. This problem must be studied and solved. Another example is the bank giving instructions to the enterprises. The state bank of Japan calls it "window instructions," that is giving instructions to the enterprises on how they should use the loans. When an enterprise borrows money from the bank, the bank will ask the reason and make suggestions as to what to do and what not to do. The interest rates for loans are different. If the loans are used for doing what is encouraged by the government, the interest is low, otherwise, the interest is high. In the past our banks became the treasury of the Financial Ministry. They did not give enough guidance to the enterprises' economic activities. Therefore, the government's economic administrative departments have a lot to do in the reform of the management system, which can be summed up as follows: It is necessary to carry out overall planning, coordination, service, statistics and supervision and constantly solve new problems. Here we must emphasize that appropriate regulation by planning mechanism must be combined with regulation by market mechanism and that the planning, statistics, banking, commercial, material and foreign trade systems should cooperate with the departments in charge in unfolding market investigation and economic analysis work and in giving instructions to the enterprises' economic activities. This is a very important task to fulfill. Recently, many enterprises in many places rushed headlong into mass action to produce electric fans, washing machines and refrigerators. Now there are more than 1,000 electric fan producing factories throughout the country, and it has caused the stockpiling of electric fans.

How has it happened? The main reason is that they did not have a thorough knowledge of the market situation nor did they carry out scientific market analysis.

After the reform of the economic system is realized, the party committees at all levels can get away from daily affairs and concentrate their efforts on ideological and organizational building. They can play a better leadership role in the orientation, line and policies of economic construction. They can intensify the study of and instructions on the principles, policies and planning of the economy in order to enhance the level of economic management.

The present economic system must be reformed. On this problem we must be resolute. But the reform should not be too fast. Because the reform of the economic system is a new thing to us, we may be confronted with new situations and new problems. We must study these new situations and solve these new problems promptly. In the process of the reform, we may meet with difficulties. When confronted with difficulties, some comrades often want to backtrack. This is not a good attitude. According to the spirit of the Central Party Committee, the reform must be carried through and no one is to backtrack. But the pace must be stable. The reform must be carried out in the process of readjustment so as to make it beneficial to readjustment. Only in this way, can we handle well the relations between readjustment and reform and guarantee the smooth realization of these two tasks.

ECONOMIC PLANNING

BRIEFS

HUBEI QUALITY CONTROL CONGRESS--From 1 to 3 September, the first Hubei provincial quality control groups congress was held in Yichang Municipality. At the congress, there was a slide show to demonstrate the work done by 22 quality control groups. Four outstanding quality control groups were nominated to be representatives to the national quality control congress. The congress also gave awards to 55 outstanding quality control groups in the province. Representatives attending the congress put forward the following proposals: 1. Do a good job in propagandizing the importance of overall quality control and in holding various study classes for different personnel. 2. All districts, departments and enterprises must control pilot quality control work and should make plans to carry out overall quality control. 3. Promote quality control work by the masses. 4. Conduct a series of activities to shift the focus of quality control work on to prompting new products and techniques. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 4 Sep 81 HK]

ROLE OF BANK OF CHINA FOREIGN EXCHANGE LOANS DESCRIBED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 7, 4 Jul 81 pp 45-46

[Article by Wang Chenggui (3769 2052 6311) and An Baocai (1344 0202 2088): "Foreign Exchange Loans Have Promoted the Readjustment of the National Economy"]

[Text] In keeping with the requirements of economic development and readjustment, the Bank of China has issued a certain amount of short-term foreign exchange loans over the past several years. These loans are mainly used to import advanced technology, to purchase and import key equipment and goods and materials in short supply domestically, and to refurbish old enterprises. In general there have been high yields with low expenditures of money and rapid recoupment of the loans. The foreign exchange loans have played a relatively good role in supporting the development of the following departments and trades.

One, they have bolstered the China Ocean Shipping Company in developing an ocean fishing fleet.

For a long time, China's ocean shipping capability has been seriously inadequate. In order to spare large sums of rent for foreign bottoms, we must self-reliantly develop our own ocean shipping fleet. Foreign exchange loans issued by the Bank of China over the past several years have played a very useful role in bolstering domestic shipbuilding and in purchasing vessels from abroad. By now a Chinese ocean fleet has begun to take shape. In 1980 the volume of freight commissioned to Chinese vessels reached 71 percent of the total. This was but 13 percent in 1965. We have thus basically carried out the directive of Premier Zhou when he was alive and changed from the passive situation where we relied on renting foreign ships for ocean shipping.

Two,they have bolstered the refurbishing of light and textile industry at critical points and filled in the gaps.

The local short-term foreign exchange loans issued to the light and textile industries by the Bank of China constitutes over half of this type of loan. These funds have played a great role in filling in gaps in these industries and in unearthing the latent potential in existing enterprises. For example, the light industrial and textile products of Jiangsu Province enjoy a favorable reputation on domestic and foreign markets, but the antiquated equipment and the simple and crude factory buildings have placed limitations on increasing product variety and quality. The Nanjing branch of the Bank of China has taken light and textile industry as a critical point for added support. Over the past several years it issued approximately 80 percent of the province's total foreign exchange loans to the light and textile industry. This is equivalent to approximately 50 percent of the state's investment in Jiangsu's light and textile industries. They utilized these foreign exchange loans to import some advanced key equipment which has filled in gaps in existing enterprises and formed complete sets. Most of this equipment is already in operation and showing good results. It is estimated that when all of the $80 million in loans is showing results, output value will reach 1.3 billion yuan per annum. Of this, foreign sales will increase by 900 million yuan and domestic marketing by 400 million yuan. Taxes and profits will increase by 350 million yuan, foreign exchange from exports will increase by $400 million and net foreign exchange earned will be $320 million.

Three, they bolster the production and export of agricultural, sideline, local and aquatic products.

At present a considerable amount of China's exports are agricultural, rural sideline, local and aquatic products. The support of the production and export of these products is an important task of local foreign exchange loans. These loans have constituted approximately 20 percent of the total over the past several years and have generally achieved good results. For example, $2.2 million in foreign exchange loans were issued to the aquatic departments of the Zhoushan Archipelago to help them import principal materials in short supply for building large motorized sailing ships and cold-storage facilities. On their own they built 40 large motorized sailing ships and 3 cold-storage facilities. The ships have already yielded over 1.09 million dan [54,500 metric tons] of fish. Of this, 132,000 dan were sold for export, the fishers retained 88,000 dan and the remainder supplied the domestic markets. In addition, over 900,000 yuan in various taxes were remitted to higher authorities. By April of this year both principal and interest on the foreign exchange loans had been paid off. Basically, the state, the collective, the individuals and the bank have all been satisfied.

Four, they bolster the development of contracting engineering tasks abroad and increasing foreign exchange income.

Over the past several years China has set up some independently operated foreign engineering contracting companies. With the aid of funds and credit of the Bank of China, they have already entered the international engineering contracting market and have undertaken various contracting activities. Some have already gotten a firm foothold and contracted or completed some projects, gaining an initial reputation on the international markets. This has built a sound foundation for further entering into the international markets. The advantages of developing foreign contracting are numerous: it can increase the number of people employed, it allows us to study the advanced foreign technology in the same trades, it allows us to increase our exports of some technical and construction implements and equipment, and it can earn foreign exchange income. There is a bright future for these enterprises and the Bank of China must continue to support their development forcefully.

In sum, the foreign exchange loans managed by the Bank of China have been successful and have played a positive role in China's economic development and readjustment. At present we are still in the process of carrying out economic readjustment, so we must also make further efforts to improve and raise the standards of our foreign exchange loan work. We feel that future foreign exchange loan work should be even more tightly centered around the policy of economic readjustment. We should pay attention to further enlivening and improving our work, taking the following two aspects as our starting points.

The first is to concentrate on bolstering the refurbishing of existing enterprises and to strictly control new capital construction projects. China has 400,000 old enterprises, among which many have produced famous brand export products for a number of years. Some of these only need a slight change, to carry out some necessary filling-in of gaps or to solve the problem of some key equipment for their production to increase. At present the focus of foreign exchange loan support is on the refurbishing of old enterprises. We cannot just talk of support and want new construction and big loans. According to the spirit of readjustment and the stipulations of the state, any capital construction items which require foreign exchange loans to import advanced technology or equipment or goods and materials in short supply domestically must be carried out firmly and strictly according to the stipulated order (including the sequences of capital construction, import and loans). We must strictly prevent the mistaken method of first importing then building and thereby lengthening the capital construction front. We must also strictly prevent the unhealthy activity of first ordering goods and then applying for a loan so as to coerce the bank into issuing the loan.

The second is to give prominence to the focus of support and open up the paths of production. The total number of items of China's departments and districts which need foreign exchange loan support is quite numerous. The bank must act according to the state plan and the needs of the international market, program things in a unified manner and give prominence to the foci of support, that is: geographically, focus on China's core cities along the coast; in enterprises, focus on the refurbishing of old enterprises; among trades, focus on light industry, textiles and transportation; in product variety, focus on "famous brand" and "leading" commodities; and in the area of economic results, focus on items which spend little money, produce large benefits, create much foreign exchange and have quick paybacks. At the same time that we give prominence to the key points we should also open up the paths of production. According to the readjustment policy, the banks must pay attention to supporting the changeover of part of heavy industry and the military industry to the production of goods for civil use or for export; to supporting items for carrying out technical reform by trade; to supporting the production of electromechanical products which have export potential, to gradually transform China's export commodity structure; and to supporting the development of service trades which match the loan conditions. To sum up, only by giving active support to all those things which correspond to the readjustment policy and which have the conditions for a foreign currency loan can the bank enliven and improve such loans and promote the readjustment of the national economy.

BRIEFS

HEILONGJIANG EXPERIENCE-EXCHANGE CONFERENCE--From 26 August to 2 September the Heilongjiang Provincial Economic Commission and Financial Department held a joint experience-exchange conference in Mudanjiang Municipality to disseminate model experiences gained by the provincial industrial and communications front in the work to enact economic responsibility systems and conduct economic accounting. During the conference participants heard the report relaying the spirit of the national work conference on supply and marketing, summed up the model experiences gained by 19 units throughout the province, reviewed the work in this regard done in the past 2 years and discussed and worked out measures to thoroughly enforce and improve economic responsibility systems. Chen Jianfei, secretary of the provincial CCP committee and deputy governor of the provincial people's government, delivered a summing-up speech at the conference. In his speech he put forward some concrete principles for dealing with problems arising in the work to enforce economic responsibility systems. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 9 Sep 81 SK]

NATIONAL CREDIT COMPANY CONFERENCE--The third national conference on the work of trust and credit companies opened in Harbin 20 August. The main task of this conference is to exchange experiences in purchase, marketing, storing and transporting goods on a commission basis. Attending the opening ceremony were 91 delegates from 12 provinces and municipalities, including Beijing, Shanghai, Tianjin, Guangdong, Fujian, Guangzhou, Fuzhou, Chongqing, Xian, Wuhan, Shenyang and Harbin. [SK210724 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 20 Aug 81]

ANHUI ECONOMIC DISCIPLINE--To combat unhealthy tendencies in economic work, the Anhui Provincial Party Committee and People's Government have decided to inspect discipline in finance and economic work in the province in the near future. On 20 August groups charged with inspecting discipline in finance and economic work among organs directly under the province held a meeting of leaders of provincial-level departments, commissions, offices and bureaus in charge of financial matters. Over 200 people from some 100 provincial-level organs attended the meeting. The meeting urged all finance and accounting personnel to boldly expose problems existing in their respective units. JIANGSU COMPLIES WITH STATE COUNCIL'S RULING ON POWER CONSERVATION

Nanjing XINHUA RIBAO in Chinese 10 Jun 81 p 1

[Article by Wang Zhisan [3769 2784 0005]: "Overall Planning and Arrangements Made for Conserving Power During Peak of Farm Irrigation"]

[Text] With the arrival of the peak of farm irrigation, the Provisional Economic Committee and the Provisional Bureau of Electric Power have studied measures and arranged consumption of electric power for industrial and agricultural production and for the domestic needs of the people.

The Provincial Economic Committee and the Provincial Bureau of Electric Power, analyzing the situation of power generation and supply in the whole province, found it to be favorable. But as the weather was dry, consumption of electricity went up 23 percent in January-May compared with the same period last year and is expected to increase further from now on. With a view to narrowing down the gap between supply and demand, the Provincial Economic Committee and the Provincial Bureau of Electric Power have worked out five measures on the basis of the State Council's ruling on power conservation and made arrangements at a symposium of the chairmen of prefecture and municipal economic committees at the end of May:

1. Ensure safe generation of power. Power generation is the base of power supply. Steady generation of power means normal supply of power. In conjunction with the areas concerned the Provincial Bureau of Electric Power should concentrate on the four power plants in Jianbi, Xuzhou, Nanshu, and Nantong and strive for safe and full generation, more generation and more consumption.

2. Basing themselves on the electric power distributed by the provincial authorities, all localities should ensure focal-point supply and make overall arrangements. In supplying power, priority should be given to irrigation and threshing, to aid-agriculture industries, light industry, textile industry, energy industry, and construction materials industry, to railway stations and wharves, and to the domestic needs of urban and rural residents. For purposes other than those mentioned above, measures for restricting power supply and making way for others should be taken so as to ensure rational use of power.

3. Organize plants to overhaul engines and equipment according to plan. Having discussed with the areas concerned, the Provincial Bureau of Electric Power has

decided that during the period of farm irrigation, production of power-intensive calcium carbide, yellow phosphorus, silicon iron, electric furnace steel, and energy shall be regulated, restricted or stopped.

4. Commune-brigade industries should make way for aid-agriculture industries, and give aid to major industries. At the moment the power load is comparatively large for commune-brigade industries; during the period of farm irrigation, supply of power may be ensured for some commune-brigade industries and stopped for others, and some of the commune-brigade industries may switch to night production and save electric power to aid agriculture and major industries.

5. In the case of power consumption for farm irrigation and threshing purposes, rotation irrigation, night irrigation, and alternate consumption of power should be encouraged. By raising the power load rate from 88 percent to 92 percent, there will be 100,000 load more available for the whole province.

SUZHOU TEXTILE MILL CONSERVES POWER

Nanjing XINHUA RIBAO in Chinese 10 Jun 81 p 1

[Article by Zhang Huiming [1728 1920 2494]: "Suzhou Textile Mill Conserves Power, Saves 600,000 Yuan for the State"]

[Text] With the help of the municipal power supply department, the Suzhou Cotton Cloth Printing and Dyeing Mill has saved 600,000 yuan for the state by implementing a new power supply scheme.

The mill is a specialized one for finishing cotton cloth and chemical fibers in Suzhou municipality. In order to increase production of new varieties of medium and long fabrics in urgent market demand, the mill has added a set of equipment this year for sorting out medium and long fabrics. With this plant equipment put into operation, consumption of power will be doubled. According to the original plan, the mill is expected to build a 35,000-volt transformer station with 400,000 yuan in investment in about a year. So as to put the new plant equipment into operation at an early date, deputy chief Zhang Guijin [1728 2710 6855] of the equipment section and engineer Xue Hongsheng [5641 7703 3932] of the Municipal Textile Industry Co, having ascertained the condition of power supply in the whole mill, decided to take the road to tapping the potential. They put forward a power-supply scheme: instead of constructing a transformer station, exchange the two 560-kv tranformers at the existing transformer station for two 1,000-kv transformers, and rebuild and utilize the existing 10,000-volt circuit to ensure the volume of power supply for the whole mill. The new scheme won immediate support from the leading comrades assigned to the mill by the municipal government. The municipal power supply department gave a green light [to the plan], adjusted the power consumption plans, gave priority to consturction work, installed the circuit, and tested the performance of electrical appliances. Simultaneously with this, the mill leadership organized shock work to install equipment. It took only 4 1/2 days from the start of construction 27 April to formal test of the switch. The new equipment is now put into operation. In two or three years the mill will have solved all its problems of power supply.

The Suzhou Cotton Cloth Printing and Dyeing Mill has transferred their two 560-kv transformers to the Cotton Cloth Printing and Dyeing Mill No 3 which is speeding up preparations for operation. This has enabled the latter to give up their plan to construct a new 35,000-volt transformer station. Thus, by spending only 60,000 yuan the Suzhou Cotton Cloth Printing and Dyeing Mill has killed two birds with one stone, saving 600,000 yuan for the state.

ENERGY

PARTY, STATE ORGANS INITIATE OIL RATIONING SCHEME

Beijing RENMIN RIBAO in Chinese 15 Jun 81 p 1

[Text] The State Energy Commission, the CCP Central Committee Bureau of Government Office Administration, the State Council Bureau of Government Office Administration, the Ministry of Finance, and the Ministry of Commerce have jointly issued a "Circular on Oil Conservation Measures To Be Taken by Party Central Committee and State Organs," urging Party Central Committee and state organs to set an example, take the lead in carrying forward the revolutionary tradition of plain living and hard struggle, and play an exemplary role in conserving gasoline.

On the basis of the CCP Central Committee and State Council decision to initiate oil conservation among Party Central Committee and state organs, the five units including the State Energy Commission have recently studied and worked out "Provisional Measures for Distributing Motor Vehicles and Rationing Oil among Party Central Committee and State Organs."

The Provisional Measures require Party Central Committee and state organs to check up on their motor vehicles and work out fixed complement of vehicles according to the vehicle distribution standards. All types of motor vehicles bought through any channel with any funds should be carefully categorized and reported to the higher authorities, surplus vehicles should be delivered to the higher authorities, and deficiency will be made up in succession. The Provisional Measures set concrete standards for distribution of cars, buses, and trucks among Party Central Committee and state organs.

The Provisional Measures set oil supply standards for various types of vehicles and demand strict implementation of the rationing and conservation systems. Beginning 1 July 1981, the amount of oil consumed by various units shall be checked and decided respectively by the Party Central Committee of Government Office Administration, the State Council Bureau of Government Office Administration, the Ministry of Finance, and the Beijing Municipal Petroleum Company and supplied against coupons. Oil will be rationed; oil saved will be kept for further use; overconsumption will not be made up. All units are not permitted to obtain oil "through the back door" over and above the fixed amount, and those violating the provisions will be sternly dealt with. Oil consumed by various units when holding meetings is included in the standard amount of supply and will not be supplied separately. The Provisional Measures call upon Party Central Committee and state organs to carry out conscientiously the Provisional Measures for Collecting Fees on the Use of Cars for Private Business. Organs are not allowed to provide their staff and workers with cars for weddings and outings.

SHANXI EXCEEDS SEMIANNUAL RAW COAL PRODUCTION PLAN

Taiyuan SHANXI RIBAO in Chinese 20 Jun 81 p 1

[Article: "Our Province Completed Raw Coal Production Plan for First Half of Year 13 Days Early"]

[Text] XINHUA, Taiyuan, 18 June: Shanxi Province completed the state's raw coal production plan for the first half of the year 13 days early. Exploitation efforts progressed and by the last 10 days of May [sic], the state plan had already been completed.

From January to 17 June, Shanxi Province produced a total of 54.96 million tons of raw coal, 4.41 million tons over the state plan for the first half of the year and 103 percent of the same period last year.

Shanxi Province's coal frontline workers were enthusiastic and worked hard. At the beginning of this year, they proposed to welcome the 60th anniversary of the Chinese Communist Party by completing the state plan for the first half of the year early. Each coal mine exerted efforts to catch up with the others, and the yield of coal throughout the province increased steadily. Since January of this year, the Jingcheng Mining Bureau and the Luan Mining Bureau basically realized overfulfillment of the production plan every day, every 10 days, every month, and they completed the production plan for raw coal for the first half of the year 16 and 15 days early, respectively, becoming the first two mining bureaus to complete the state plan for unified distribution of coal in Shanxi Province.

The local coal mines, which bear the burden of fulfilling nearly half of the province's raw coal production plan in Shanxi, completed the raw coal production plan for the first half of the year early, on 7 June, and they contributed importantly to the completion of the raw coal production plan for the first half of this year in the entire province. From January to 17 June this year, a total of over 27.3 million tons of raw coal was produced, more than 3.5 million tons over the state plan.

CATALYTIC CRACKER USES CARBON MONOXIDE COMBUSTION SUPPORTER

Beijing BEIJING RIBAO in Chinese 5 Jul 81 p 1

[Article by Zhao Jupeng [6392 1565 7720]: "Dongfanghong Catalytic Cracking Unit Uses New Technology to Conserve Energy and Eliminate Pollution; Investment of Less Than 500 Yuan Realizes Over 10 Million Yuan of Benefits a Year"]

[Text] The Dongfanghong Refinery catalytic cracking unit of the Yanshan Petrochemical Company has successfully utilized the new technology of adding a carbon monoxide combustion supporter. For an investment of less than 500 yuan, many good results were achieved: conserving energy, eliminating, pollution, stabilizing production, and increasing the retrieval rate. The two items of conserving energy and increasing the retrieval rate alone realized an economic benefit of over 11.7 million yuan a year.

During production, the catalytic cracking unit produces a lot of chimney gases containing a certain amount of carbon monoxide. In the past, part of the carbon monoxide was used, but the rest was released into the atmosphere, thus wasting energy sources and seriously polluting the atmosphere. At the same time, because the carbon monoxide in the catalytic regenerator did not burn fully, the consumption of catalysts increased. Last year, workers in this unit went to a brother plant to learn the new technique of using a carbon monoxide combusion supporter. Under the leadership of the plant and the support of workers of other units, they quickly completed the technical measures to use the carbon monoxide combustion supporter. After over 6 months of production practice, it was proven that it produced visible economic results.

First, it conserved a lot of energy. In the past, the catalytic cracking unit produced carbon monoxide with precious chemical energy in the regeneration of catalysts, but a lot was released in the exhaust. With the use of the carbon monoxide combustion supporter, the unit achieved complete combustion of the carbon monoxide; 13,930,000 kilocalories of heat were retrieved per hour; the sprayed light diesel oil in the regenerator of the past was not used, and so 6,400 tons of light diesel oil were conserved throughout the year at a value of 1.53 million yuan.

Second, it eliminated pollution. The catalytic cracking unit released about 80,000 cubic meters of chimney gases into the atmosphere per hour in the past and the exhaust contained about 7 percent carbon monoxide, seriously polluting the environment. After using the carbon monoxide combustion supporter, the content of carbon monoxide in the chimney gases dropped to 0.6 percent.

Third, it increased the rate of retrieval of light oils. After using the carbon monoxide combustion supporter, the retrieval rate of light oil increased over the past. In 1980, 69,200 tons more gasoline and diesel oil were produced than in 1979; aside from the value of heavy diesel oil that is produced in lesser amounts, each year the retrieval of light oil alone increased the accumulation of over 10 million yuan for the state.

NEW WATER-TYPE LUBRICATING OIL BL-60 DEVELOPED

Beijing BEIJING RIBAO in Chinese 5 Jul 81 p 1

[Article by Chen Lei [7115 7191]: "BL-60 Oil Containing Water-Type Lubricating Oil Has Been Successfully Developed; Compared to the Use of No 50 Motor Oil, It Can Conserve 50 Percent of Oil Consumption and Environmental Pollution Is Reduced"]

[Text] The Beijing Exploitation Institute of the Coal Sciences Research Academy has successfully developed a type of new oil-conserving material--BL-60 oil containing water-type lubricating oil that is difficult to burn and is not poisonous--in technical cooperation with the Beijing City Scientific Coordination Group. It can replace No 50 motor oil as a lubricant and thus conserve 50 percent of oil consumption.

BL-60 lubricating oil is made by emulsification using about 40 percent mineral oil with water added and additives. The lubricating results are good. Concerned departments carried out industrial experiments at the Beijing Zinc Wire Plating Plant to use it as a lubricant to produce 2,100 tons of plated zinc wire, and the quality met all requirements. Using No 50 motor oil, pollution of the environment was greater. Using BL-60 lubricating oil, the production of harmful substances such as carbon monoxide can be reduced by three-fourths.

After determination by concerned departments, the use of BL-60 lubricating oil has been recognized as a new way to conserve oil.

SHANXI SETS RECORD IN POWER GENERATION FOR FIRST HALF OF YEAR

Taiyuan SHANXI RIBAO in Chinese 8 Jul 81 p 1

[Article by Kong Zhijun [1313 1807 0193]: "Shanxi Power Generation Sets Record High in First Half"]

[Text] The electric power industry of Shanxi has been advancing steadily during the readjustment, fulfilling the quota of the first half of the year by 25 June, 5 days ahead of schedule. The amount of power generated is up by 150,000,000 KWH over that of the same period a year ago, setting a historic high.

Guided by the line laid down by the Third Plenum of the Central Committee, the provincial Bureau of Electric Power Industry has had some initial successes in overcoming power shortages and reversing the passive situation. It installed new generating units and exploited the potential of the existing facilities as it implemented the readjustment program. This year has seen more improvements in generation of power, and, basing power generation on consumption instead of limiting consumption by generation, they have produced ample power for industrial production.

As the power supply increases, the electric power department is turning its attention to selling more power to more consumers. During its province-wide survey of power, the Bureau of Electric Power Industry combined the drive for new consumers and the survey of power consumption to provide the customers with voluntary services. Its people went to the villages to assist the consumers and production teams to erect power lines, install equipment and train electrical workers so as to make power accessible to village consumers. As a result, power consumption in the villages during the first half of the year rose by 10.3 percent over that of the same period a year ago.

While working to provide more power to more customers, the department also tries to tackle such crucial problems as the removal of "bottlenecks" in the transmission and transformation of power. Due to inadequate power transmission and tranformation facilities, the consumers in certain localities and units still face the problem of blackouts even though there is plenty of electricity at the power plants. To improve the situation, 33 percent instead of 15 percent of this year's total investment will be set aside for the installation of transmission and transformation facilities. Moreover, the funds for renewal and renovation are to be spent as much as possible for power transmission and transformation so as to exploit all potential and increase transmission capacity.

As for the day to day management of production, the leadership of the provincial department of electric power industry requires a meeting on production every morning to seek prompt solutions to problems concerning the generation and supply of power and coordinate the relationship between its generation and consumption. The key cadres of the department went to the power stations at Shentou, Datong, Niangziguan and to the Xinxian region to conduct surveys and research, summarize experience, and solicit the opinions of the masses on how to generate and sell more power, all with a fair measure of success.

BRIEFS

SICHUAN SMALL HYDROELECTRIC STATIONS--Extensive construction of small-scale hydroelectric power stations in the Dabashan region, Sichuan, has been going on fervently in recent years. Over 540 stations with an installed capacity of more than 73,900 kilowatt have already been built. The Dabashan region, a reservoir of hydropower resources, has abundance of rainfall and is crisscrossed by rivers and streams and drained mainly by the tributaries of Jialingjiang, including Qujiang, Bajiang and Zhouhe. According to the findings of a general survey, the installed capacity of the power stations which could be built may reach over 1,000,000 kilowatt. Since the liberation, especially in most recent years, the people's government has been working to develop hydroelectric power. It has been building large numbers of small-scale hydroelectric power stations as it constructs large and medium power stations and the state electric power networks. The capacity of the generators installed in both 1979 and 1980 was over 10,000 kilowatt each year. The capacity of those installed in the current year has already exceeded the total of the preceding two years. Now the entire Dabashan region, studded with small-scale power stations, has over 21,000 kilometers of transmission and transformation cables. All the towns and 95 percent of village people's communes of the region have become the end-users of electricity. The development of electric power promotes local industrial and agricultural gorwth. The local industries now include metallurgy, mining, coal, electronics, machine-building, electric power, chemical fertilizers, food, chemical industry, building materials and textile. The gross industrial output value of 1980 was 26 times that of the years immediately after the liberation. [Text] [Hong Kong ZHONGGUO XINWEN in Chinese 18 Jul 81 p 2] 5360

INDUSTRY

BRIEFS

SHANDONG INDUSTRIAL OUTPUT--Shandong provincial industrial and transport enterprise increased August output value and profits 4 percent over the July figures. Light and textile products markedly increased of the 30 major products, 20 increased in output. The output of bicycles in August increased by 19.7 percent; sewing machines, 22.3 percent; and wristwatches, 42,2 percent over July. Output of plastic articles, cotton yarn and cotton cloth also slightly increase. [Jinan Shandong Provincial Service in Mandarin 2300 GMT 5 Sep 81 SK]

JILIN MUNICIPAL-LEVEL INDUSTRY--In the past 32 years since the founding of the PRC, industrial production has advanced by leaps and bounds in Changchun Municipality, Jilin Province. The 1980 municipal industrial output was valued at 3,878,100,000 yuan, a 107-fold increase over 1949, or showing a yearly average increase of 16.3 percent. In addition, vehicle production in Changchun Municipality accounts for one third of the total output in our country. Its output of passenger trains makes up over 50 percent of the total national output. [SK241120 Changchun Jilin Provincial Service in Mandarin 2200 GMT 21 Aug 81]

GUANGZHOU MECHANICAL, ELECTRICAL INDUSTRY--The Guangzhou municipal and mechanical and electrical industry has readjusted its production structure and orientation and subsequently increased production. It has fulfilled a total production value of 269 million yuan in the first half of this year, showing an increase of 3.4 percent over the corresponding period last year. The municipal mechanical and electrical industry has seriously implemented the readjustment principles and has vigorously aided the development of light industry. The number of factories engaging in production of mechanical and electrical products for daily use has increased from 12 to 23 this year. The total fulfilled export output has increased by 40 percent in the first half of this year over the corresponding period of last year. In addition, the processing trade has also vigorously developed. [HK219741 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 12 Aug 81]

SHANDONG TECHNOLOGICAL INNOVATIONS--Industrial and communications departments in Shandong Province has completed 410 projects for tapping industrial potential and creating new technologies in the first 8 months of 1981. These projects can help increase the annual industrial output by 783 million yuan and annual taxes and profits by 181 million yuan. The province has invested heavily to promote consumer goods production. [SK130014 Jinan Shandong Provincial Service in Mandarin 2300 GMT 11 Sep 81]

NORTHWEST INDUSTRIAL COOPERATION--Yinchuan, 2 Sep (XINHUA)--A technical and economic cooperation network among the second light industrial departments of Shaanxi, Gansu, Ningxia, Qinghai and Xinjiang was formally set up at a conference of technical and economic cooperation among the second light industrial departments of northwest China held recently in Yinchuan. The conference decided that initially these five provinces and autonomous regions will carry out cooperation in the manufacture of leather goods, plastic wares, metalware, garments, foot and headgear and handicraft goods. Cooperation projects will include evaluation of the quality of major products, scientific research, study and exchange of new technology, training of technicians, setting up of an information center, marketing of industrial goods and so forth. [OW081307 Beijing XINHUA Domestic Service in Chinese 0115 GMT 2 Sep 81]

JILIN FIRST LIGHT INDUSTRY--The Jilin provincial second light industrial department had fulfilled 70.7 percent of the annual output plan by the end of August, an increase of 10.4 percent over the corresponding 1980 period. [SK061046 Changchun Jilin Provincial Service in Mandarin 2200 GMT 5 Sep 81]

HENAN INDUSTRIAL PRODUCTION--The Henan provincial CCP Committee and the provincial government have organized directors of all committee, offices, bureaus and departments at provincial level, scientific and technological personnel and cadres, totaling some 150 people, into 10 work groups, which went to Zhengzhou, Kaifeng, Luoyang, Pingdingshan, Xinxiang, Anyang, Jiaozuo and Hebi municipalities and Zhoukou and Shangqiu prefectures on 25 August to help them increased industrial production. The main task of these work groups included mobilizing the workers to increase industrial production from September to December this year. Before the work groups left, Li Qingwei and Yue Xiaoxia had held a meeting of work groups' leaders. [HK040455 Zhengzhou Henan Provincial Service in Mandarin 1130 GMT 26 Aug 81]

SHANDONG LIGHT INDUSTRY--Jinan Municipality, Shandong Province, has shifted the emphasis of its investments from heavy industry to the light and textile industries. Since last year, investments in light and textile industries have accounted for over 90 percent of Jinan's industrial investments. The city's light and textile industrial output in the first 7 months of 1981 increased 12.1 percent over the corresponding 1980 period. Profits handed over to the state increased 27 percent. Compared with the corresponding 1980 period, production of washing machines increased 1,300 percent in the first 7 months of 1981; silk nearly 200 percent; and wristwaches, chemical fibers, wool products and steel furniture, over 30 percent. [SK010333 Jinan Shandong Provincial Service in Mandarin 2330 GMT 31 Aug 81]

LIAONING ELECTRONIC PRODUCTION--Through a 2-year readjustment, Liaoning electronic industrial enterprises have scored remarkable achievements. The output value has surpassed the figure of 1979 by 47 percent. In the first 6 months of 1981, it surpassed that of the corresponding 1980 period by 23 percent. Meanwhile, provincial products enjoy brisk sales across the country because of their fine quality. [SK211230 Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 21 Aug 81]

CEMENT QUALITY--Beijing, 29 Aug (XINHUA)--The State Council recently approved a report submitted by the Ministry of Building Materials, the State Economic Commission and the Ministry of Agriculture on the quality of domestically produced cement. It distributed the report to all localities concerned calling for improving the quality of cement produced by small cement plants. According to the report, more than 3 million dun of cement waste products was turned out by cement plants throughout the country in 1980 and that some 9 million dun of cement produced by small cement plants was not subjected to quality tests based on standards set by the state. As cement greatly influences the quality of projects, it is of great importance that the quality of cement produced by small cement plants be improved, the report said. [OW301123 Beijing XINHUA Domestic Service in Chinese 0740 GMT 29 Aug 81]

SYMPOSIUM ON STEELMAKING--Beijing, 7 Sep (XINHUA)--The first Sino-Japanese symposium on steelmaking, sponsored by the Chinese Society of Metals and the Iron and Steel Institute of Japan, opened today in Beijing. More than 80 Chinese and Japanese specialists, noted professors and engineers are attending the current symposium in order to exchange information on new technological developments in steel and iron industry and deepen mutual understanding and friendship. At this symposium, 30 academic papers will be read, of which 14 are Chinese and 16 are Japanese, on physical chemistry of steelmaking, pretreatment of hot metal and vacuum metallurgy, steelmaking processes and solidification processes. Under the agreement concluded by the Chinese Society of Metals and the Iron and Steel Institute of Japan in 1979, the symposium on science and technology of iron and steel will be held every three years either in China or in Japan. BRIEFS

LHASA CAPITAL CONSTRUCTION--Buduoji, vice chairman of the Xizang Autonomous Regional People's Government, spoke at the regional work conference on capital construction. He said: the major task of capital construction in the coming years is: to further implement the policy of readjusting the national economy and eliminate the influence of leftist ideology. At the same time, we must speed up the construction of public facilities, such as electricity supply and transport. The regional work conference on capital construction was held in Lhasa from 10 to 20 August. Guo Xilan, secretary of the autonomous regional CCP Committee and Yang Zhongxin, vice chairman of the regional people's government attended the meeting. The meeting summed up the experience in capital construction in the past 2 years and planned the major tasks in the years to come. [HK260329 Lhasa Xizang Regional Service in Mandarin 1130 GMT 24 Aug 81]

LIAONING SCHOOL CONSTRUCTION--By the end of August, Liaoning Province had commissioned new schools totaling 200,000 square meters in floor space at higher education institutions, an increase of 50,000 square meters over the corresponding 1980 period. [SK061046 Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 5 Sep 81]

GUANGZHOU SATELLITE TOWNS--From 18 to 22 August, the Guangzhou municipal revolutionary committee held a forum on town planning and rural housing. The forum decided that within this year, Panyu, Hua, Conghua, Zengcheng, Longmen and Xinfeng counties and Shahe, (Wushan), (Jianggao) and (Dagang) townships be built into satellite towns of Guangzhou Municipality. Representatives from all counties, districts and bureaus who were attending the forum inspected the town planning situation of (Dagang) township in Panyu County. [HK040455 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 23 Aug 81]

FUJIAN ECONOMIC CONSTRUCTION--The Fujian Provincial Party Committee and people's government recently made a decision to step up economic construction in Fujian's old revolutionary bases and called on various departments to support the project with manpower, material and funds. The decision stressed the construction of roads, water conservancy projects and powerplants and the development of cultural, educational and public health projects in these areas. LABOR AND WAGES

BRIEFS

HUNAN YOUTH EMPLOYMENT--Since 1980, more than 13 prefectures and counties in Hunan have established farms and plants in suburban and nearby rural areas to provide employment for young people. These farms and plants offer salaries like other farms and plants. The 19 August HUNAN RIBAO carries this piece of news on the front page with an editorial note. The editorial note said: This is a very good practice for it not only provides more job opportunities for young people, but also strengthens the production bases for daily commodities. Such a practice solves population problems in urban areas; it differs from the past practice whereby youths had to go and work in the countryside and mountain areas, for it is not a temporary measure and the youths are receiving good salaries and other benefits. [HK260315 Changsha Hunan Provincial Service in Mandarin 2300 GMT 18 Aug 81]

GUANGDONG UNEMPLOYED YOUTHS--Guangzhou Municipality has taken measures to encourage unemployed youths to seek employment by themselves and to develop individual undertakings. In the first half of this year, the municipality had some 15,000 licensed individual undertakings, 46 percent of which were operated by unemployed youths. Over the past 1 year or so, the municipality has set up an additional 16,000 commerical points and stalls, of which some 4,000 are in the catering trade, some 6,000 are in the commercial trade, some 2,000 are in the repair and assembly trade and some 400 are in the garment trade. [HK240932 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 19 Aug 81]

YOUTH EMPLOYMENT--Over 2.81 million jobless youths were provided employment throughout China in the first half of this year, an increase of 320,000 compared with the corresponding period of last year. Since the beginning of this year the number of collective enterprises and individual businesses has increased. According to statistics, the number of individual businesses has risen by 111,000. The number of labor service companies has also increased. There are now over 1,500 labor service companies throughout the country. [Beijing Domestic Service in Mandarin 2230 GMT 28 Aug 81 OW]

HENAN ON BAD WORK STYLE OF BUS STATION

HK030552 Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 1 Sep 81

[Text] According to a GONGREN RIBAO report, (Wang Shuhe) of the Zhengyang County CCP Committee Propaganda Department wrote a letter to the editorial board of GONGREN RIBAO which it ran under the title of "The Zhengyang County Bus Station Practices Bad Work Style." The letter said: The service of the Zhengyang County bus station is very poor. Some drivers and conductors often willfully beat up passengers under the pretext that they are traveling without paying for tickets. On the afternoon of 21 October last year, a conductor was riding on the bus to (Xiyandian) commune. When the bus arrived at the terminus, the conductor forcibly dragged a laborer who works on a public road repairing project who had left the bus back onto it and asked him to produce his ticket due to his own negligence in checking the tickets earlier in the trip. The laborer replied: You already checked my ticket before I got off the bus and since I am not going to use it to claim reimbursement, I threw it away after I got off the bus. The conductor insisted that the laborer buy another ticket and told the driver to start the engine and taken this laborer back to town. Seeing that the bus was moving, the laborer tried to get off the bus. Then, the conductor slapped him in the face and beat him up, and attempted to strangle him. While striking the laborer, the conductor asked: Are you afraid of me now? The laborer answered yes. However, the conductor kept on striking him up until there was blood all over the laborer's face. One of the passengers could not put up with this any longer and gave the conductor 2.2 yuan for a ticket for this laborer. But as a result of this, this passenger was rudely scolded by this conductor, and the conductor continued to strike the laborer until the bus was at (Baima) bridge which was about 2 miles from (Xiyandian) commune and let him get off the bus there.

The passengers traveling on the same bus also reflected: It is very difficult to buy a ticket to get a seat in Zhengyang bus station, or even if people can buy tickets, they still cannot get seats. Cases in which those without tickets can ride on a bus while those with tickets are badly treated are often seen. In addition, the drivers and conductors often make use of the buses to take care of personal business without any thought to delaying passengers. On 4 November last year, when the Zhengyang County public security bureau published the order to detain, according to law, the conductor who beat passengers without a cause, the head of the bus station, accompanied by some people, went to the public security bureau and tried to settle the case with the persons in charge. In addition, he also allowed some 30 works and staff members of the bus station to drive their buses to the public security bureau and after threatened to strike. The wrong deeds of the head of the station encouraged the drivers and conductors of the station to practice a bad work style. It is impossible for people to put up with the serious problems of the Zhengyang County bus station. We call on the departments concerned to practically strengthen leadership and seriously rectify the bad work style in order to bring about a new appearance of the bus station.

BRIEFS

JIANGXI GOVERNOR, VICE GOVERNOR--Nanchang, 4 Sep (XINHUA)--Traffic congestion was a serious problem on an east suburb highway in Nanchang city. The congestion was caused by heavy traffic on the highway and a railroad crossing running across the road. Recently, however, the congestion has been alleviated. Bai Dongcai, permanent secretary of the Jiangxi Provincial CCP Committee and governor of Jiangxi, issued instructions on the solution of the problem. Measures for alleviating the congestion were adopted at a recent meeting presided over by Fu Yutian, secretary of the provincial party committee and vice governor. BRIEFS

GANSU ENTERPRISE MANAGEMENT CONFERENCE--The Gansu Provincial CCP Committee recently convened a conference on the democratic management of enterprises. Ziao Jianguang, secretary of the provincial CCP committee, attended. The conference called for stepping up the party leadership in enterprises, establishing workers' congresses and pushing the democratic management of enterprises onto a new stage. According to a survey of 642 enterprises, 389 of them had convened workers' congresses as of the end of July. Many units have elected team, section and workshop leaders through democratic processes. The conference called on industrial, communications and capital construction enterprises under the jurisdiction of county-level authorities or higher which have not established workers' congresses to establish them before the end of the year. Units whose workers' congresses do not function well should analyze the causes and take effective steps to correct them. [SK131125 Lanzhou Gansu Provincial Service in Mandarin 1125 GMT 12 Sep 81]

HUBEI COMMODITIES CIRCULAR--Recently, the Hubei Provincial People's Government issued a circular demanding that all localities in the province seriously implement the regulations of the State Council's circular on curbing unhealthy trends in commodities circulation. The circular of the provincial people's government demanded that all departments in charge of economics in all industrial, commercial and collective enterprises in cities and towns as well as commune- and brigade-run enterprises should study the State Council's circular and curb unhealthy trends. The circular stressed that any unit which continues in promoting unhealthy trends will be investigated and held liable for any losses. Serious cases will be tried according to state laws. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 28 Aug 81 HK]

HUNAN ILLEGAL GOLD TRANSACTION--(Liu Wanyun), commune member of (Longxing) brigade, (Xiadong) commune in Chaling County; and (Tan Wei) of (Dalong) brigade in (Zichun) commune illegally bought up gold to engage in speculation and profiteering. They were recently tracked down and handled by the Longhui County Industrial and Commercial Administrative Bureau. On 8 March this year, on the production of the certificate of the (Zichun) commune agricultural machiner plant in Chaling County, (Liu Wanyun) and (Tan Wei) assumed the names of (Tan Jielian) and (Liu Qingyun) and went to (Liugouzhai) and (Jinshan) in Longhui County, which are gold production places, to illegally buy up 313 grams at 20.50 per gram. They were tracked down by the (Liu gouzhai) industrial and commercial office on 11 March. When they were being investigated, they took the opportunity to sieze ill-gotten money and goods and fled. They were later arrested by students of Longhui County No 2 Middle School and 313 grams of gold which they had illegally bought up with 6,416.50 yuan, 505 yuan in cash and 2 watches were seized from them. Investigation revealed that (Liu Wanyun), (Tan Wei) and other people at large sneaked into gold production places in Longhui County to illegally buy up gold on many occasions. They then sold it in Guangzhou to reap staggering profits. They violated the state regulations on financial administration. [HK040455 Changsha Hunan Provincial Service in Mandarin 2300 GMT 23 Aug 81]

HEILONGJIANG COUNTRY DIVERSIFIED ECONOMY--Linkou County, Heilongjiang Province, has developed a diversified economy since 1979. It earned 19 million yuan from the diversified economy in 1980 and is expecting to earn 27 million yuan in 1981. It has afforested 1.4 million mu of land in 1981, planted 30,000 mu of flue-cured tobacco, raised 54,000 sheep and 24,000 cattle and maintained 12,000 beehives. This county has specialized teams composed of 15,000 persons, 4,000 technicians, 5,000 specialized households and 2,200 diversified economic bases. ECONOMIC PLANNING

HONG PAPER ON POSSIBLE SHANGHAI ECONOMIC ZONE

HK290405 Hong Kong WEN WEI PO in Chinese 29 Aug 81 p 3

[Dispatch from Shanghai: "Economists Are now Launching a Discussion on Whether Shanghai Should Set up a Special Zone"]

[Text] Economists in Shanghia are now launching a discussion on how to develop the economy there. There are two different views; one holds that Shanghai should adopt flexible and special policies, take advantage of its superior features and gear itself to the world market. The other holds that Shanghai should act like Guangdong and Fujian and set up a special economic zone.

In the first half of this year eight economic experts including municipal CPPCC members Li Lixia and Sheng Muuie proposed to the Shanghai City CPPCC that Shanghai should draw in foreign investment and set up a special economic zone, so as to develop the city's economy. This proposal attracted much interest among Shanghai economists, who came out with different ideas on whether the city could set up a special economic zone.

Those who do not agree to setting up a special zone hold that since Shanghai has a strong industrial foundation, a powerful science and technology force, talented people, and a century of accumulated technical experience, the city should develop its export trade, gear itself to the world market, and use its technology and skills to compete with foreign countries. At the same time it should import advanced foreign technology to an appropriate degree in order to tap potentials and carry out innovations and improvements in the existing enterprises. What Shanghai needs is not a special economic zone but a relatively flexible special policy that will help to take advantage of its superior features.

Those who agree to setting up a special economic zone hold that there will be many advantages and few disadvantages in doing so. To open up an international market in Shanghai is better than the foreign trade method practiced at the Guangzhou trade fairs, and by setting up a special zone "a hundred flowers can bloom" and many experiments can be carried out.

There are also differences of opinion on the question of opening up Pudong. Some hold that Pudong could be a special economic zone, and foreign capital could be used to open it up. Others do not agree, saying that Pudong is the only valuable piece of land in Shanghai's long-term planning, and it must not be used in an indiscriminate way. If in the future the two banks of the Huangpu river are joined up, land values at Pudong will be comparable to those on the Bund and Nanjing Road, and even to those in Tokyo's Shinjuku and Ginze districts. It is extremely improper to develop this valuable land into a special economic zone.

FINANCE AND BANKING

CHINA TO RAISE FUNDS THROUGH BANKING SYSTEM

HK100600 Hong Kong WEN WEI PO in Chinese 9 Sep 81 p 8

[Report from Beijing correspondent Cheng Xiang [4453 5046]: "China Stresses Speed of Economic Development; Banking System To Bring Into Play its Functions in Raising Funds"]

[Text] In regard to the problem of the strategy of economic development, China recently renewed its emphasis on speed and holds that despite the readjustment, a certain speed should be maintained in its economic development. This is different from its former emphasis on adequate retreat, on resolutely making an adequate retreat--"to die first and revive later" as China put it. It shows a remarkable change in China's policy of economic development.

As the rate of increase of development during the first half of this year was only 0.8 percent and this reflected a situation of stagnation in its national economy, the Chinese Government put forward a new viewpoint that during the period of readjustment the rate of increase cannot be high, but there should not be a zero rate of increase. Otherwise, the whole economy will be depressed. The Chinese Government realizes that this readjustment differs greatly from the one in 1962. During the readjustment in 1962, a large number of small local enterprises closed down and many projects were canceled. As a result, a large number of workers were dismissed and returned to the countryside and stopped receiving wages from the state. Therefore, though the rate of increase was low or even negative, the burden on the state was lightened. Although there has also been "closing down, suspension, consolidation and shifting to other production" during this readjustment, there has been no fall in the number of workers and wages have been paid as before. Meanwhile, there is still the problem of youths awaiting jobs. Under such conditions, there cannot be high rate of increase in economic development, but there should not be a zero rate of increase; otherwise, it will be impossible to maintain economic stability.

Having renewed its attention to speed, China is faced with the outstanding problem of how to achieve speed, or to be more specific, how to raise funds for increasing the speed. As there are already heavy financial burdens on the state, no funds can be drawn from state finances to increase the speed. Therefore, the funds can only be supplied by the banking departments. Under such circumstances, the recently-ended meeting of the Chinese People's Bank held in Chengde and the meeting of the Bank of China held in Taiyuan became very important.

Our correspondent learned from the two banks that at the Chengde meeting the following measures were put forward to raise funds at home: 1. Development of diversified forms of deposits to draw funds from the general public, including special deposits such as housing deposits and building material deposits; 2. The issue of negotiable bonds and simultaneous commissions to sell and purchase the debentures issued by enterprises so as to raise long-term funds; 3. The introduction of trust business in its branches in major cities; 4. The development of the insurance business in the country; 5. The strengthening of credit management so as to speed up the turnover of floating capital and reduce the amount of idle funds; 6. The popularization of middle-term and short-term equipment loans to help some factories and mines expand and renew their equipment, thus giving rise to new productive capacity.

The Chengde meeting concentrated its discussions on the problems in raising funds in the country, while the Taiyuan meeting of the Bank of China discussed how to raise funds from abroad. The meeting affirmed the experience gained in the past 2 years in developing banking activities abroad and held that the banking business should keep developing, specifically by the following three methods: 1. The 14 banks in Hong Kong and Macao (13 in Hong Kong and 1 in Macao) should coordinate and form a banking group to intensify their competitive capacity. 2. Joint venture banking enterprises should be set up abroad and it has been considered whether branches of these enterprises should be set up abroad. Meanwhile 14 banks were allowed to set up branches abroad according to the needs of their business. 3. The three insurance companies in Hong Kong should strengthen their coordination with the banking system in the future. Regarding the banks' business in the future, they should make efforts to attract deposits and do their best to combine their business with the export trade such as by providing remittance securities. They should also renew trust services. The meeting expressed the hope that every means should be resorted to mobilize foreign funds for raising the speed of economic development.

What was common in the two meetings was that both were for "raising, accumulating and using funds" to guarantee that during the readjustment period a certain speed could be achieved in the development of our national economy.

'WEN WEI PO' CITES PRC'S SECOND QUARTERLY FIGURES

HK081256 Hong Kong WEN WEI PO in Chinese 5 Sep 81 p 3

[Report: "China's Second Quarter Financial Statistics for 1981"]

[Text] ZHONGGUO JINRONG [CHINA'S FINANCE] (vol 9, 1981) published today carries China's second quarter financial statistics for 1981.

1. Condition of state credit, loans, revenue and expenditure

Items	Unit: 100 million yuan 1981 Balance at end of second quarter
Total of various deposits	1,753.17
Enterprises' deposits	561.89
Financial deposits	267.46
Capital construction deposits	188.00
Departments and organizations' deposits	260.13
Urban savings deposits	323.36
Rural deposits	152.34
International financial organizations' deposits	53.81
Currency notes in circulation	306.39
Bank capital	504.52
Profit for the year	16.43
Other items	9.89
Total source of funds	2,644.31
Total of various loans	2,394.44
Loans to industrial production enterprises	438.48
Loans to industries, supply and marketing enterprises and material departments	239.05
Commercial loans	1,352.20
Loans to short and medium term installations	58.60
Loans to urban collectives and individual businesses	83.36
Loans to forward-purchasing down payments	18.34
Loans to state-run farms	13.18
Loans to rural communes and production brigades	191.23
Amount of gold	12.16

Items	1981 Balance at end of second quarter
Amount of foreign currencies	32.53
Assets in international monetary organizations	34.83
Financial loans	170.23
Total funds utilized	2,844.31

2. Condition of rural credit and cooperatives' deposits and loans

Unit: 100 million yuan

Items	1981 Balance at the end of second quarter
Total of various deposits	231.54
Deposits from communes and brigade collectives	49.39
Deposits from commun and brigade enterprises	19.27
Deposits from individual commune members	144.46
Other deposits	18.42
Total of various loans	129.37
Agricultural loans to communes & brigades	66.27
Loans to commune and brigade enterprises	38.50
Loans to individual commune members	24.60

3. Condition of exchange rate, gold and foreign exchange reserves.

Items	1981		
Exchange rate:	April	May	June
Special drawing right units converted into yuan (end period figure)	2.0184	2.0402	2.0098
$ converted into yuan (end period figure)	1.6840	1.7436	1.7467
$ converted into yuan (average figure)	1.6620	1.7227	1.7605
Gold and foreign exchange reservers foreign exchange (in $100 million)	25.59	32.04	38.10
Gold (in 10,000 oz)	1,280	1,280	1,280

BRIEFS

INDUSTRIAL PROJECTS TENDERS INVITED--Beijing, 7 Sep (ZHONGGUO XINWEN SHE)--The Chinese National Technical Import Corporation has issued an international circular inviting tenders for the supply of essential equipment and materials for three extension projects at Shijiusuo port, Yanzhou-Shijiusuo railway and Qinhuangdao port. The main equipment and materials required in this international tender include crawler excavators, crawler rock drillers, mobile air compressors, wheeled loaders, dump trucks for rocks, diesel caterpillar pile drivers, cross-country wheeled cranes, hydraulic truck cranes with stretchable arms, geological drills, irregular corrugation shapers and rolled steel. In accordance with the agreement between the Chinese Foreign Investment Control Commission and the Japanese Overseas Cooperation Fund, the total cost of the above-mentioned equipment and materials will be charged against the loan extended to China by Japan. The Chinese National Technical Import Corporation invited citizens of all qualified supplying countries and experienced and renowned manufacturers and trading companies which are organized and registered in these qualified supplying countries to submit tenders. The period for submitting tenders runs from 23 September 1981 to 10 October 1981, and the sealed tenders will be opened on the afternoon of 11 October 1981. LABOR AND WAGES

'WEN WEI PO' ON REFORMING WAGE SYSTEM IN CHINA

HK311125 Hong Kong WEN WEI PO in Chinese 30 Aug 81 p 1

[Dispatch from Beijing: "Wages and Bonus Systems Are Being Reformed"]

[Text] China's enterprises are attempting to reform their bonus system as well as to practice the piece-rate wage system and the system of giving awards by scoring work points in order to change the old situation of "eating out of a big pot." The remuneration to enterprises can differ: the highest remuneration may be 150 percent higher than the lowest.

According to the No 16 issue of BAN YU TAN, one of the major reasons why the industrial situation is not as good as the agricultural situation is that there is no strict responsibility system in industrial production and egalitarianism among the workers and staff has not yet been overcome. There are two "big pots" in the industrial front: the "big pot" of the state for enterprises and the "big pot" of enterprises for workers and staff.

At present, as the wage system has not yet been reformed, it is necessary to find out some method for distributing the profits among the enterprises (or distributing the gains due to a reduction of losses) and in giving bonuses to workers, so as to remedy the defects in the present wage system. First, there must be differences between the enterprises. The workers and staff in the enterprises that have a better economic effect (regardless of whether they are state-owned or collective enterprises) must receive a better income than others. Second, the piece-rate wage system should be put into practice in the groups (or among individuals) which are able to practice this system. For those groups or individuals whose conditions still do not allow this system to be practiced, the system of giving bonuses by scoring work points may be practiced. This is to ensure that the bonuses are distributed according to one's work and that the skillful and hardworking workers get more than others. According to our experience and lessons in the past few years, on the question of wages and bonuses, we must adhere to the following two principles: 1. The increase of both the production of the enterprises and the income of the state must be guaranteed. This means that an increase of production and income should be reflected in profits that are really made or in really useful wealth. The enterprises which do not help the state in increasing income cannot retain more funds for themselves; therefore, the workers and staff in these enterprises can get no more than others. 2. In distribution, we must conscientiously carry out the principle of "more work more pay and less work less pay." Those who overfulfill the production quota should get more and those who do not fulfill the task should get less. Thus, due to differences in the accomplishment of tasks, the highest remuneration may be 150 percent higher than the lowest.

LOTTERY SAVINGS PROGRAMS EXPANDED

Beijing SHICHANG in Chinese 20 Jul 81 p 1

[Article by Li Shan [2621 2619]: "21 Provincial Banks Set Up Lottery Savings"]

[Text] According to the findings of the authorities concerned, the people's banks of 21 provinces, municipalities and autonomous regions have launched lottery savings campaigns. There are several other provinces and municipalities still awaiting deposit slips to be printed before launching the drive. Lottery savings is a kind of banking operation which sets aside some or all of the interest to be awarded as prizes to the winners, who may win a few up to several hundred yuan, based on their rankings.

Although the lottery savings programs of the different localities differ in details, they are, generally speaking, fixed amount, fixed period lottery savings; fixed period deposit/lump-sum withdrawal lottery savings; current deposit lottery savings; and combined fixed and current deposit lottery savings. The prizes are drawn once a month, semi-annually or annually. The banks in those areas where the lottery savings program is in operation are already realizing a tremendous increase in deposits. The day the program began in Guangzhou, more than 100,000 people bought savings certificates and some 500,000 depositors brought a total of 5 million yuan to the banks. The 8 million yuan worth of savings certificates issued last April in Wuhan were bought by the masses in a few days. According to statistics, all the cities and towns of the whole country reached, during the first 4 months of 1981, an average of 40.7 percent of their savings targets for the year. Since the introduction of the lottery savings program, however, Guangzhou has reached 74.56 percent of its target, Fujian 68.07 percent and Xinjiang 63 percent. The people's banks in many areas which are in favor of savings with both interest and prizes and many small prizes for more people have been able to extend the benefits to a large number of participants of the program. When the prizes were drawn in Zhejiang last January, over 27,000 people were winners and 260 of them won grand prizes. The prefectures of Huimin, Linyi and Liaocheng of Shandong even provided 1300 "Golden Deer" bicycles for the winners of the first and second prizes to buy. Assured of the advantages of savings, the masses have expressed their willingness to practice austerity and step up their savings. Some depositors who won prizes spent their prize money to buy more savings certificates.

ENERGY

DEVELOPMENT IN COAL MINE CONSTRUCTION, PRODUCTION OUTLINED

Beijing MEITAN KEXUE JISHU [COAL SCIENCE AND TECHNOLOGY] in Chinese No 6, Jun 81 pp 2-4

[Paper presented by the China National Mining Committee at the 48th Session of the Organizing Committee of the World Mining Congress: "The Development of China's Coal Industry"]

[Text] China is a country endowed with extremely rich resources of energy. Coal is the chief energy source of our country, and accounts for approximately 70 percent of the overall consumption of various nonrenewable energy sources, while petroleum and natural gas account for approximately 26 percent, and hydropower accounts for almost 4 percent.

Following the founding of New China, the coal industry has developed tremendously. In 1949, the raw coal output in this country (excluding Taiwan) was merely 32.4 million tons; in 1980, it rose to 620.13 million tons, which was more than 19 times that of the 1949 output at the average growth rate of approximately 10 percent per annum, i.e., an annual mean net growth of 19 million tons. Of the total coal output, approximately 55 percent was produced by mines run by the Ministry of Coal Industry, about 10 percent was produced by provincial mines, and approximately 35 percent came from local mines. Most of the provincial and local coal mines were medium and small pits widely distributed over some 1,100 counties across the country. Twenty of the mining districts under the direct jurisdiction of the Ministry of Coal output over 5 million tons per annum, and there are 10 large mining districts which have the capacity to produce over 10 million tons of coal each year: Datong, Kailuan, Fengfeng, Yangquan, Fuxin, Jixi, Hegang, Xuhou, Huibei, and Pingding Mountain. In 1980, their total coal output amounted to 143 million tons, which accounted for approximately 42 percent of the total output of Ministry-run mines. About 95 percent of the coal produced by Ministry-run mines were recovered by miners. Now, there are 543 pairs of pits and 13 open cast mines. On the average, the mining pits have 2,096 coal faces, and the greatest mining depth has reached 1,000 meters. Following are the distribution of coal outputs from coal seams of different dip and thickness measurements:

Seam Dip (Percent)		Seam Thickness (Percent)	
gently inclined	82.2	thin	12.7
inclined	12.2	medium	43.3
steep	5.6	thick	44.0

1. Coal Resources

Our country not only has rich coal resources, but also a long mining history. According to the annals, the Chinese people were already familiar with the use of coal as far back as 475-221 B.C. By the 1st Century A.D., coal mining had reached a fairly large scale, and coal was used for iron smelting. Since the liberation of China, a great deal of geological surveying work has been carried out. Up to now, the total proven reserves throughout the whole country have reached 640 billion tons. The coal formation ages in our country are early geological periods, and there are numerous coal forming epochs. There are stone-like coal deposits which had formed from algae in the early Palaeozoic era. The formation of the coal resources occurred primarily from the Early Carboniferous epoch to the Tertiary period. The richest formations are Jurassic, Permian and Carboniferous, the total coal volume of which account for over 95 percent of the overall coal reserves. The coal resources are widely distributed all over the country. The total area of coal-bearing strata amounts to some 500 thousand square kilometers, which is approximately one-eighteenth of the land area. With the exception of Shanghai, all thirty provinces, cities and autonomous regions (including Taiwan Province) throughout the whole country have coal resources. Roughly, there are five coal-bearing areas: the Northeast, North China, South China, the Northwest, and Yunnan-Xizang Coal Regions. The North China Coal Region has the greatest reserves, accounting for approximately 40 percent; the Northwest has approximately 32 percent, and the Northeast accounts for about 21 percent.

China has a complete assortment of coal varieties; lignitic coal accounts for 8 percent of the total reserves, non-caking and weak-caking coals account for 28 percent, low-metamorphosed bituminous coal 31 percent, medium metamorphosed bituminous coal 8 percent, highly metamorphosed bituminous coal 6 percent, anthracitic coal 9 percent, and 10 percent is composed of assorted coals. Our country has fairly rich resources of coking coal, over half of which is gas goal. In terms of coal rank, Jurassic coal is generally regarded as fairly good as it has relatively low ash and sulphur contents; in North China, Carboniferous coal has relatively high sulphur contents, Permian coal has relatively low sulphur contents, but their ash contents are rather high. The geological conditions of China's coalfields are diversified; the thick coal seams are characterized by great specific gravity, and most of them are coal measures with fairly short interlayer distances. In some mining areas, the hydrogeological conditions and geological structures are comparatively complex. The methane gas contents are rather high.

2. Coal Mine Construction

After the founding of New China, tremendous efforts have been made to expand the productive capacity of mines, and technological improvements were carried out in some old mining districts, thus greatly enhancing their productive capacity, e.g. Datong, Kailuan, etc. Meanwhile, a number of new coal bases have been built, including Pingdingshan, Huaibei, Xuzhou, etc., which can produce over 10 million tons of raw coal per annum; Xishan, the Two Huais [i.e., Huainan and Huaibei in Anhui Province), Shitanjin, Liupanshui, etc., which can output over 5 million tons of raw coal annually. It takes approximately 6-8 years to build a pair of large size mines, and 5-6 for medium size mines.

Owing to the complex geological conditions, many different kinds of special tunnelling techniques are employed in the construction of mines. In the construction of 330 vertical shafts, such special tunnelling methods as freezing, boring, drop-shaft, injector, curtain, etc., were employed. The freezing method, in particular, was used to build 187 shafts; the largest shaft diameter is 8 meters, and the maximum freezing depth is 345 meters. The boring method was used to build 24 shafts, the diameter being 7.9 meters, and the maximum 308.6 meters. In recent years, such rigging equipment as 0.6 cubic meters rock machines, umbrella drilling rigs, 3 cubic meters buckets, winders, high-head suspended pumps, etc., have been employed in ordinary vertical shaft tunnelling operations. The highest monthly record ever attained in shaft construction has reached 120 meters.

Over the past few years, the construction scale of mining shafts (including open cast mining shafts) is about 100 million tons. In order to ensure coal output increases, it will be necessary to step up and expand the current scale of construction. In view of such factors as coal reserves, coal demands, traffic conditions, and investment results, Shanxi, North China, the Northeast and Henan will be the keypoint areas of construction for a period of time. Shanxi Province abounds in coal resources, and its proven reserves is 200 billion tons, accounting for one-third of the nation's total reserves. Moreover, this province has a complete assortment of coal varieties, which can be recovered from fairly shallow deposits. As the geological structure is simple, it is possible to develop vertical shafts, inclined shafts, adits, and open cast pits, which require little investment but can produce quick turnovers, and will enable the entire province's coal output to reach over 200 million tons per annum. Dadong, Shuoxian, Yangquan, Lu'an, Pucheng, Xishan, Gujiao, Xiangning will become the province's chief coal bases. East China is the most economically developed area in our country. It has vast coal reserves in the Two Huais, Yanzhou and Xuzhou Mining Districts. These mining districts are close to sea ports and railways which makes transportation quite convenient. These areas are to be energetically developed. The Northeast is a major industrial base which consumes large quantities of coal. It has bountiful coal resources in Liaoning, Heilongjiang, Nei Monggol provinces and regions. The coal seams are fairly shallow in such areas as Yiminhe, Huolinhe, and Yuanbaoshan, which is suitable for open cast mining. The coalfields in the central and western parts of Henan Province are ideally situated in terms of geographical location, and await further exploitation. Such mining districts as Pingingshan will be further developed.

The policy of simultaneously developing large, medium and small mines will continue to be the guideline for the construction of coal mines. While large-scale coal mines, medium and small pits will also be built in accordance with resources conditions, large numbers of local small coal pits will also undergo gradual technical innovations.

3. Coal Production

Among the various coal mines run by China's Ministry of Coal Industry, the longwall coal-mining method is chiefly used for recovering coal from gently inclined and inclined coal seams. The inclined top-slicing caving method and flushing/ ascending method are used for coal seams that are especially thick. In pitch mining, the following methods are employed: yielding shield support method, overhand method, and horizontal slicing method. The hydraulic mining method is applied in coal mining areas with suitable conditions. Following is a comparison of the current recovery rates resulting from several major coal mining methods:

single longwall	46.8 percent
flushing	3.4 percent
room-and-pillar/abandoned pillar	5.2 percent
horizontal slicing	0.6 percent
inclined slicing	31.7 percent
tool-pillar (?)	4.9 percent
hydraulic coal mining	2.3 percent
others	5.1 percent

At present, the following kinds of support/shields are used in coal faces: longwall coal faces generally employ single frictional metal props, a small number of work faces use single powered supports; approximately 100 coal faces use hydraulic powered supports; and some work faces employ wooden props. The chief kind of frictional metal props are microbearing series. The external and internal injection single powered props have also become a series of their own; their initial supporting power is 7-11.8 tons; the working resistance is 25-30 tons; the pillar height is 0.6-2.5 meters. Today, our country uses three kinds of powered supports in production, i.e., the prop type, the prop/shield type, and the shield type, the working resistance is 2 x 75 to 4 x 150 tons, the height of the supports amount to 0.92-3.5 meters.

The chief kinds of coal mining machines employed are 80, 100 kW single-ended coal winning machines and 150, 170 kW double-ended machines, 80 kW planing machines. The general means of conveyance are 80, 150, 250 kW double-chain scraper conveyors, and 180 kW single-chain scraper conveyors, which can convey 150, 250, 500 and 600 tons of coal per hour respectively. Generally, the mechanized working face of coal mining machines are powered by 660 volts electricity. A small number of coal faces are using 1,140 volts explosion preventive electric equipment on trial basis.

In coal production, steps are also being taken to gradually increase the mechanization level of coal mining. In 1980, the coal mining mechanization level of Ministry-owned coal mines was 36.8 percent. This included combined mechanization level, which was 13.1 percent; the average monthly combined work face output amounted to 33,680 tons; the mean work face efficiency was 13.3 tons per manshift; the highest annual output reached 925,000 tons. As a whole, the mechanization level, technical equipment, and work efficiency of China's coal mines are still comparatively low and require further improvement.

4. Coal Utilization

In China, the consumption of coal by common industries, thermal power stations, civilians, coking industry and railway transportation are as follows: 46.6 percent, 20.3 percent, 18.1 percent, 10.6 percent and 4.4 percent respectively.

At present, in our country, approximately 100 million tons of raw coal are sent to the washery each year, producing more than 50 million tons of prepared coal annually. Here, coking coal is the chief kind of raw coal which undergoes preparation. This includes difficult coal and extremely difficult coal. Jigging and flotation are the chief methods employed in coal separation. In some coal mining districts the heavy medium separation method is employed for difficult coal. Our country can produce in batches complete sets of equipment for washeries with washing capacity below 2 million tons per annum. It has already begun to develop and manufacture the chief equipment for large washeries which can handle over 3 million tons per annum. Some washeries have set up centralized monitoring systems for total plant control. Some plants are using total automation systems on trial basis.

In our country, gas coal accounts for more than one-half of the caking coal as the proportion of cindery coal is comparatively low. At present, research efforts are under way to find suitable plans for coking mixed coal in various regions, and also to find coking techniques primarily for coal gas. Low calorific fuels are extensively used in the southern provinces of China and in the vicinity of some coal mining districts for boiling furnaces and manufacturing construction materials; chemical raw materials are extracted from stone-like coal and coal wasters (e.g., vanadium pentoxide, polymeric aluminum, etc.). In our country, approximately 250 million cubic meters of gas are produced each year and used for combustion as well as manufacturing such chemical products as carbon black. To properly utilize coal, facilitate transportation and reduce pollution, researchers are trying to develop highly efficient coal gasification and direct coal liquefaction techniques.

5. Mine Designing and Machinery Manufacturing

The coal industry in our country has set up its own designing organizations. At present, there are 29 designing institutes, 8 of which belong to the Ministry of Coal Industry. The designing contingent is composed of nearly ten thousand staff workers. Each designing institute has its own force of technical experts and engineers who possess rich experiences in designing work. Over the past three decades, some 1,500 pairs of mining shafts have been designed and constructed (open cast mining) and their overall projected capacity is 480 million tons; more than 150 washeries have been designed and built, and their total projected capacity is 100 million tons. China has also designed and constructed explosive plants, construction material plants, machinery repair and manufacturing plants, as well as special railways and highways. In addition, we have also helped other countries design mines and washeries.

China's coal industrial system has 34 key machinery manufacturers with 65,000 staff and workers plus 200,000 tons of annual processing and manufacturing capacity chiefly devoted to producing coal mining machinery, equipment and instruments, e.g., probe drilling, geophysical exploration, excavation, transportation, support/shield operation, safety, etc. The First Ministry of Machinery Building has factories which produce equipment for hoisting, ventilation, and drainage, as well as some of the equipment used in open cast mining and coal dressing. China is now capable of producing in batches all kinds of powered supports, single powered props, emulsion pump stations, double chain conveyors, transfer machines, belt conveyors, 80 and 100 kW single-ended coal winning machines, 150 and 170 kW double-ended coal winning machines, tunnelling machines, large vertical shaft construction equipment, various types of safety instruments, meters, etc. At present, we not only can satisfy domestic needs, but also exportation to other countries.

6. Coal Education and Research

Our country has colleges and schools which specialize in training people to work in the coal-mining industry. At present, there are 12 coal mining colleges with over 14,000 students; 36 polytechnic schools with some 18,000 students; and 100 technician training schools with 45,000 students. Besides, there are over 14,000 people taking coal mining courses in sparetime schools, telecourse colleges, university correspondence courses and all kinds of special training classes for cadres.

There are three types of research organizations in the coal science research system, i.e., the [Chinese] Academy of Coal Sciences which is subordinate to the Ministry of Coal Industry and covers the whole country, provincial (regional) coal research institutes which are concerned with major coal producing provinces (regions); and research institutes which belong to factories and mines.

The Academy of Coal Sciences focuses mainly on major technical problems in coal industrial production and construction as well as related techniques and basic theories. Established in Beijing in 1957, it now has 11 disciplinary research institutes, 3 of which are in Beijing, and the rest are located in Fushun, Taiyuan, Tangshan, Xi'an, Shanghai, Chongqing, Huaibei, and Changzhou. It also has a scientific research and development center in Changzhou. The Academy is staffed by some 5,000 personnel, approximately half of which are scientific and technical workers. At present, the main direction of its scientific research is to improve the precision and speed of exploration, reduce mine construction period, develop mechanization of tunnelling operation, perfect safety techniques which emphasize prevention, and properly utilize coal resources.

For over the past three decades, China's coal industry has developed tremendously. Adjustments are now underway to enable the coal industry to better adapt to the needs of the national economy, and advance steadily. By relying on our own resources, we must continue to develop international cooperation, enhance scientific and technical exchanges, and thus further develop coal industry and coal sciences and technology.

On the principle of mutual benefit, we are willing to adopt any form of joint exploitation venture with friendly countries and private enterprises. We are also prepared to provide all sorts of technical assistance to friendly nations and contribute our part to solving the overall energy problem.

SCIENTIFIC MANAGEMENT OF COAL MINE POWER CONSUMPTION

Beijing MEITAN KEXUE JISHU [COAL SCIENCE AND TECHNOLOGY] in Chinese No 6, Jun 81 pp 47-49

[Article by Zhang Shuangju [1728 7175 5112] of the Power Department, Production Division, Ministry of Coal Industry: "The Utilization of Electricity in Coal Mines and Ways of Economizing Electric Power"]

[Text] In modern coal mines, power consumption is the chief manifestation of energy consumption. Hence, the conservation of electricity constitutes a major proportion of coal mine energy conservation work. Due to different conditions of various coal resources, plus differences in technical equipment level and management level, there are great power consumption gaps between the various coal mines. Among coal mines under the unified distribution system, the consumption of electric power per ton of coal output can reach as high as 92 watts in some mines, while some merely consume 14 watts. Even within the same mine, the power consumption level is bound to rise as the working face grows continuously deeper and further away while the hoisting height and hauling distance increase, and the outflow volumes of gas and water become increasingly larger. To improve operational conditions and enhance work productivity, it is necessary to increase the degree of mechanization in mining work, which also leads to greater consumption of power. According to statistics of 1970-1979, the recovery depth of coal mines under the unified distribution system increases progressively by an average of 4.6 percent per annum; on the average, the combined power consumption per annum progressively increases by 2.5 percent for each ton of coal produced; the gross electric power consumption of all the mines progressively increases by an average of 8.2 percent each year. The ascent in power consumption level is determined by the characteristics of the mines. Without improper use of electricity, it would be quite reasonable to assume that the rising level of power consumption indicates the ever-growing depth of the coal face as well as the ever-upgrading level of coal mining technical equipment. When the coal output increases, it is quite normal to have increases in the overall power consumption of mines. But, there are also quite a few coal mines which waste power due to inadequate enterprise management, improper use of equipment and failure to replace old and inefficient equipment, which is not the proper way of using electricity. The aim of power conservation work is to put an end to improper power consumption and ensure proper use of electricity.

Every link in coal production is furnished with a certain amount of equipment; each equipment consumes power in the course of operation. Thus, the main way to save electricity is to enhance enterprise management, improve equipment conditions, properly centralize production, and operate equipment economically. Due to the many differences that exist among various coal mines, their potential capacities for conserving electricity also vary. Therefore, it is imperative to conduct surveys on power consumption, make necessary technical tests and evaluations, and find out the potentialities for power conservation before taking appropriate measures against the main obstacles and thus attain better results in power conservation work. In recent years, under the guiding principles underlying the readjustment of the national economy and guided by the policy of "stressing both the development and conservation" of energy sources, all the mines have put in a tremendous amount of effort into the drive to save electricity, and have achieved fairly good results. Based on the practical experiences of all the organizations, and in light of the current coal mining situation, here are some power conservation measures that are easy to achieve and worth popularizing.

1. Enhance Electric Power Control and Make Timely Load Adjustments

The power system links the electricity generator, power supply and electrical equipment into an integrate body. Thus, the stability of the load bears a certain amount of influence on the utilization of the power system's capacity and the economical use of the equipment. Actually, peak loads are bound to occur at certain times each day within a power network. The greater the peak load is, the greater impact the power grid comes under. Enhancing the power control by avoiding peaks, using off-peak hours, and increasing the load rate not only helps to utilize the capacity of the power system, but also helps the users to cut down on electricity bills, which is very important. The Benxi Mining Bureau has 30 power controllers in five of its production mines; their job is to properly fix the on/off hours of the equipment, make timely adjustments on the load, and determine the peak and off-peak hours in accordance with the load curves and production situation, thus maintaining the load rate of all the mines above 87 percent. In 1980, an average of 2,500 kW was taken off the maximum load, and the entire province managed to save 150,000 yuan from the maximum load power costs.

The practice of running zero load or half load equipment over a long period of time not only prevents full use of the equipment's capacity, but also increases power consumption. The timely readjustment of improperly used equipment produces striking results in power conservation. Since 1980 when Baotou's Changhangou Mine made proper load adjustments in accordance with its production situation by cutting down two 320 kVA transformers, replacing 75 kW and 100 kW water pumps with a single 115 kW pump, it has saved 150,000 watts of electric power each year, which represents 1.5 percent of the annual power consumption.

2. Add Power Efficiency, Reduce Useless Consumption

The power efficiency is an important technical/economic index in power supply management. It represents the effective use of electric energy. By raising the power efficiency, it is possible to enhance the effective power supply capacity of the power grid, reduce circuit losses, and cut down electricity bills. At present, of all the coal mines in the whole country, there are still 14 bureaus (mines) whose power efficiencies are under 0.85 and have to pay fines for [low] power efficiency to the Ministry of Electric Power Industry. To increase their power efficiencies to 0.9, these organizations will have to instal 150,000 kVAR capacitors, which costs approximately three million yuan but can reduce circuit losses and save about 30 million watts of power each year (which includes decrease of circuit losses both in the Ministry of Electric Power Industry and mines). On top of this, the coal mines will also receive over one million yuan's worth of power-efficiency bonuses each year, and obtain extremely remarkable economic results as well. Since 1979, the Shuangyashan Mining Bureau has increased its power efficiency from 0.81 to 0.91 by installing 7,000 kVAR capacitors, popularizing the synchronization of wound-rotor motors, adjusting loads and removing 400 kVA transformers. In the past, it had to pay more than 200,000 yuan of power efficiency fines; now, it receives bonuses of over 200,000 yuan each year, and the results are quite remarkable.

3. Improve/Renew Equipment, Enhance Operational Efficiency

Our country lacks frequent renewal of products or equipment; much of the equipment in our mines now were produced in the 1940's or 1950's, and the machines are of poor efficiency and consume a lot of power. Improvement or renewal of such equipment can increase operational efficiency and save electricity. The power consumption of water drainage equipment in coal mines of the unified distribution system account for approximately 25 percent of the total power consumption; over one-half of the drainage equipment in current use are old or outdated hardware. If such equipment could be renewed, and low-efficiency pumps could be replaced with high-efficiency ones, it would be possible to make up the equipment renewal expenses with the amount of money saved from the electricity bill within approximately one year. For example, by replacing an SSM200x7 type water pump with a newer 200 D43x7 model, it is possible to raise the efficiency by more than 10 percent and save approximately 170,000 watts of electricity each year; the amount of electricity bill saved in one year alone is almost enough to purchase two water pumps (excluding motors). At present, our coal mines are using quite a number of 70B-2 type axial-flow fans and 4-62 type, 9-57 type centrifugal-flow fans which all have fairly poor efficiency. It is possible to make technical innovations on the 70B-2 axial-flow fan by installing bent-blades, which helps to increase the efficiency by approximately 5 percent. With the help of paddle-wheels from 4-72 type centrifugal fans, it is possible to improve the 4-62 or 9-57 fans and increase their efficiency by 15-30 percent. Generally, the costs entailed in the technical innovation of the preceding equipment can be recovered in about half a year from power conservation, and the economic results are fairly good. According to preliminary calculations, if 3,000 low-efficiency pumps are renwed in unified-distribution coal mines, it is possible to save approximately 300 million watts of electricity per year. If 1,100 low-efficiency fans are innovated in these mines, approximately 140 million watts can be saved each year. The renewal and innovation of the two preceding kinds of equipment cost about 28.5 million yuan; approximately 31 million yuan can be saved from the electricity bill each year. The economic gains are quite evident.

Over the past two years, many coal mines have managed to save an enormous amount of electric power through equipment renewal and innovation. The Benxi Mining Bureau improved 31 SSM type pumps, adjusted 2,900 meters of pipelines, pumped water without bottom valves, and thus increased the drainage efficiency by 8 percent. Moreover, 2.5 million watts of electricity were saved in 1980, which amounted to 1 percent of the total power consumption. Based on variations in the underground ventilation system, the Liaoyuan Mining Bureau adjusted the working point of two fans by reducing the rotation speed, and improved the performance of two axial-flow fans by mounting bent blades, thus conserving 2.1 million watts of electricity annually, which amounts to 1.2 percent of the total power consumption. The Lu'an Mining Bureau equipped all of its 18 working faces with troughed belt conveyors, and replaced scraper conveyors with belt conveyors, thus reducing over one-half of the power consumption and saving 130,000 watts of electricity each month, which improved the conveyance capacity and reduced transportation casualties and maintenance crew. Thus, it is quite plain that equipment renewal and innovation not only help to improve efficiency and conserve electricity, but also help to improve working conditions and, to a certain extent, promote production.

4. Stop Leak Holes and Reduce Losses

Due to improper maintenance and management, quite a number of coal mines have leak problems in their ventilation systems, blower systems and drainage systems. In some cases, the leakages in the reversing doors of the main fans are as much as 15 percent; and in some blower pipelines, the losses incurred from air leakage reach 15-20 percent. An enormous amount of electricity can be saved by strengthening maintenance and management, promptly plugging up leak holes, stopping air and water leaks. Last May, the Gaokeng Mine of the Pingxiang Mining Bureau checked the consumption rates of blowers in all its mining and excavation areas; then, it made proper adjustments in the pipeline system, set up certain a schedule for turning on the blowers, fixed up 96 air leakage spots, and removed 1 km of useless pipes, thus succeeding in reducing 40 percent of the blower losses and saving 100,000 watts of electricity. The Pingxiang Mining Bureau popularized the experiences of Gaoheng Mine, enhanced management of the blower systems, and reduced losses. In the third quarter, 25 percent of the blower system's consumption rate was cut down as compared with the second quarter, and 107,000 watts of electricity was saved. In the Macun Mine of the Jiaozuo Mining Bureau, the drainage system had collected 6 mm of dirt on the pipe walls due to long period of use; after cleaning the pipes, the wall-friction losses dropped, and the drainage efficiency rose 5 percent.

Some coal mines fail to promptly fill up useless tunnels and drill holes. As a result, the drainage increases and more power is consumed. By plugging up useless tunnels and drill holes on time, striking results can be attained in cutting down drainage power consumption. Due to relatively large water-make in the mining pits, the drainage power consumption of the Jiaozuo Mining Bureau had accounted for approximately 60 percent of the total power consumption. The bureau built waterproof walls in the mines, injected slurry into the ground and sealed up drill holes. It also stopped the water gush in Tianmen Pit's Zone 2, Lifeng Mine's Zone 48, Zhucun Mine's Southeast Zone; as a result, a total of 29 tons/minute water-make was cut off, thus saving over 5 million watts of drainage power annually, and reducing the electricity bill by more than 300,000 yuan.

5. Strengthen Control over Use of Electricity in Living Quarters

Generally, the living quarters in mining districts account for 3 percent of the total power consumption. Although this portion of electricity consumption does not occupy a large proportion, it nonetheless represents quite a lot of untapped potential. Due to poor management and inadequate metering devices, some organizations have quite a few problems arising from improper use of electricity, such as large bulbs and 24-hour lighting. There are quite a number of organizations which have managed to enhance control over the use of electricity in living quarters, i.e., installing electric meters, charging electricity bills according to meter readings, abolishing the fixed billing rate system, and basically putting an end to improper use of electricity, such as large bulbs and 24-hour lighting, which helped to greatly reduce electricity consumption in living quarters. The Lu'an Mining Bureau intensified electricity management in living quarters by installing more than 1,600 electric meters in family dormitories, implemented the metered billing system, and cut down the entire bureau's lighting load from 870 kW to 659 kW, amounting to 24 percent.

It should be pointed out that besides the preceding power conservation measures, it is also very helpful to step up enterprise management, improve overall arrangement of production, implement proper centralization of production, start economic operation of equipment, popularize new power-saving technologies, such as far infrared drying, industrial resistance furnaces improved with aluminum-silicate refractory fibers, electric machines with power brakes, etc. As each mine varies in management level and natural conditions, it is imperative to combine power conservation with the specific conditions of each organization, adopt key measures that are right on target, and tap power-conservation potentialities. This way, greater results can be achieved.

BRIEFS

ANHUI COAL DRESSING PLANT--Hefei, 17 Jul (XINHUA)--A coal dressing plant with an annual capacity of 1.8 million tons has gone into operation in Suxian County, Anhui Province, according to the Huaibei coalmining administration. The Luling coal dressing plant, built on the Tianjin-Pukou railway line, is a key project of Anhui's Huainan and Huaibei coal base. The direct flotation technology is being used for the first time with equipment made in China. The plant uses locally mined coal, which has a low level of ash and sulphur. The plant will help raise industrial production in East China. The Huainan and Huaibei coal base has proven deposits of well over 22,000 million tons. One mine has been completed and six other pairs of shafts are being built. [Text] [Beijing XINHUA in English 1217 GMT 17 Jul 81]

HEILONGJIANG PETROLEUM SUPPLY--The Heilongjiang Provincial Economic Commission, the Trade Union Council, the Scientific and Technological Association and the Commercial Bureau jointly issued a circular: Beginning 1 September, petroleum companies at all levels throughout the province will supply 50 percent of petroleum used in cleaning metals to industrial and communications departments and substitute the other 50 percent with metal detergent to conserve petroleum. This metal detergent is a valuable new product, and it is a proven metal cleaner and can prevent metal from becoming rusty, lower the costs, improve conditions and protect workers' health. [SK302322 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 28 Aug 81]

ANHUI COAL INDUSTRY--To accelerate development of energy sources, the Anhui provincial people's government recently decided to set up a provincial coal industry leading group. The leading group is composed of comrades (Kang Zhijie), (Jiang Derong) and (Zhang Jianyi) with (Kang Zhijie) as its leader. The group exercises unified leadership over coal production and capital construction in the province. [OW07622 Hefei Anhui Provincial Service in Mandarin 1100 GMT 5 Sep 81]

OIL FIELDS DISCOVERED--Oil and gas fields with 15 to 20 tons daily output per well have been discovered in the northern part of the Dongpu Depression in central China, according to Liu Songwei, geophysicist of the China Petroleum Exploration Development Company. Dongpu Depression, this hydrocarbon-bearing area near Zhengzhou, is in the southwestern part of the North China basin and covers an area of about 4,800 square kilometers. It is a sedimentary depression of the mesozoic-cenozoic group which is 7,500 meters thick, said Liu Songwei who is in Beijing attending a joint meeting of the Chinese Geophysical Society and the

Society of Exploration Geophysicists. The oil deposits are somewhere from 1,400 to 3,500 meters below the land surface. They are generally from 15 to 25 meters thick. Geophysical exploration of the Dongpu Depression began in 1955 and seismic exploration started in 1969. It is relatively easy to do field seismic work on the surface of the depression which is a cultivated plain, Liu said, however, there are difficulties in working in the river beds and banks of the Huanghe which runs across the whole area. Seismic exploration will be shifted to the western and southern parts of the depression in the future, he said. [Text] [HK100332 Hong Kong TA KUNG PAO in English 10-16 Sep 81 p 1]

MEASURES TO MAINTAIN STEADY INDUSTRIAL GROWTH STUDIED

Shanghai JIEFANG RIBAO in Chinese 3 Aug 81 pp 1, 3

[Article by unidentified correspondent: "Measures To Maintain Steady Industrial Growth in Shanghai--Difficulties in Increasing Production Encountered Despite Fine Situation, According to Comments by People in Economic Circles of Industry and Communications During First 7 Months; Four Important Questions Raised"]

[Text] During the first 7 months of this year, the total output value of the industrial-communications sector was 0.3 percent below the same period of 1980, and the net production in heavy industry was more than the net increase in light industry. Furthermore, this trend may continue on an even larger scale. This will raise some thought-provoking questions: Is the present situation with regard to industrial production good or bad? How can a steady increase in production be maintained during the readjustment period?

Industrial Product Mix Tends To Be More Rational

Some people in local economic circles have felt that in juding the situation with regard to production, we should not confine our observations to figures; instead, we should see through the outer appearance of figures and study the essence of the problem. Basically, the present situation is good for production according to the present trend of development. Although the total output value for the first 7 months was below that of the same period in 1980, some striking changes have occurred in the makeup of output value. From January to June, for example, there was a marked increase in the production of key items of consumer goods for daily use. During this period, the output value of 22 different consumer goods that indicate consumption trends was above that of the same period last year by 16.9 percent. Apart from the reduced production of certain items that were not readily marketable, such as tape recorders and furniture, there was an increase in the production of many other items compared with the same period the previous year. The varieties and designs have also been increased. The administrative bureaus of the textile industry, light industry, and handicrafts have successfully trial-produced 329 different new products and more than 12,000 new designs. The ratio of new varieties and new designs in serial production was raised from 70 percent in 1980 to more than 85 percent in 1981. There was a sharp drop in the production of capital goods required for heavy industry and capital construction, but a large increase in the production of items in short supply in the market and of equipment and raw materials required for the light and textile industries. The output value of 106 short-supply items by the First Machinery and Power Bureau in the first half of this year showed an increase of 22 percent--including a 27-percent increase in light industrial machinery--over the same period last year. The ratio of light industrial products (including textile, handicraft, and electronic products for civilian use) to total industrial output in the municipality increased from 52.6 percent in 1980 to 54.8 percent in 1981. Because of greater attention to market needs in the organization of production and the constant readjustment of the product mix, goods are now more readily marketable, instead of being kept in warehouses over long periods as they were before. Thus the turnover of circulating capital has accelerated, with great economic benefits. All this shows that in the past 7 months, Shanghai's industry has been based on market demands, with priority being given to the production of consumer goods. The product mix has become more rational, and, in the course of readjustment, industrial production is now undergoing a healthy development in accordance with objective economic laws.

Great Enthusiasm of Broad Masses of Cadres and People

Some people in economic circles have also held that in judging the situation of production, we should not confine our observations to indexes; instead, we should also note the mental attitude of the broad masses of cadres and people. At present, morale is very high among the cadres and workers of all trades and professions, and they are making every possible effort to enliven the economy and produce better economic results. Although light, textile, and handicraft production has increased year after year by a wide margin, and productive capacity has basically reached the saturation point, they are still trying hard to tap the potential for further increases. Since the beginning of this year, the textile sector has on three occasions mobilized its personnel to make greater contributions to the state by increasing both production and revenue through the renovation of equipment, the readjusting of varieties, and the tapping of potential. The light industrial sector has constantly changed varieties and designs according to market demands in order to upgrade its products. Many forms of rewards have been tried out to increase the production of readily marketable goods. Acting in accordance with the principle of overall planning, the handicraft sector has broken through the barriers set up for the division of work among companies and has readjusted its product mix and enterprise management in order to produce more brand-name goods and goods in short supply. All departments of heavy industry have continued to reorient their service, to expand the scope of their activities, and to increase their avenues of production. The Metallurgical Bureau organized the enterprises under its jurisdiction to study market conditions and to work out plans and measures for producing the correct amounts and specifications of steel materials required to turn out the seven major light and textile items, including bicycles and textile machinery. The Chemical Industry Bureau has renovated and utilized some of its "sunlight exposure" items in order to increase the productive capacity for solar ion dyestuffs and other items in short supply. The First Bureau of Machine Building has taken the initiative to establish contact with 90 design institutes throughout the country and to cooperate with 141 machinery and power equipment companies in developing the sales of products by state-owned enterprises through private stores, or in undertaking production tasks for them. It also has formed 32 groups out of 70 plants for the production of machinery and power products in short supply. Commercial, foreign trade, financial, capital construction, and municipal administration departments have also done a great deal of work in supporting and encouraging plants and enterprises to implement the policy of readjustment by producing goods in short supply, bringing about a balanced supply and demand in the market, and boosting export trade. Thus the main feature of the present situation can be reflected from another angle by the high morale in various trades and professions.

Problems in Even a Fine Situation

Of course, a fine situation in production does not preclude the existence of problems. At present, the fairly serious difficulties encountered in Shanghai's industrial production is one of our main problems. Shanghai belongs to all the people in the country, and the rate of its industrial growth has an important bearing on the entire national economy and on the living conditions of the broad masses. We oppose the one-sided quest for output and output value regardless of the objectives of production; however, we hope for a higher rate of increase in the production of goods in short supply and easily marketable goods, including the raw materials and technical equipment required for producing these goods. This is only logical. The difficulties encountered in the industrial growth of the municipality are caused mainly by the change of certain elements during economic readjustment. Formerly, the production of steel was regarded as the key link of our national economy, and priority was given to heavy industry. The substitution of the development of consumer goods to satisfy people's material and cultural needs, in place of irrational cycle of the productive process within heavy industry, and the coordination of the production of capital goods with that of consumer goods in a healthy manner are important reforms, but during these [reforms] many new conditions and contradictions may emerge that temporarily affect production in certain departments. Furthermore, for many years within the industry itself, attention was paid only to production and to the tapping of potentials, but not to the improvement of production conditions or to facilities for daily living. Our neglect of the technical transformation of enterprises and the serious problems with the industrial layout and product mix have all contributed to the difficulties. This reflects on the arduous and complex nature of economic readjustment.

Four Problems To Be Solved in Maintaining a Steady Rate of Growth

In view of the real situation of industry in the municipality, how can we maintain a steady rate of growth during the readjustment period? Some well-informed people among economic circles have held that we should now pay particular attention to solving the following problems:

First, make greater efforts in technical transformation and equipment renovation so as to bring about expanded reproduction through the "intensive" method.

In the majority of industrial plants in Shanghai, particularly those plants engaged in light, textile, and handicraft industries, the workshops are too old and overcrowded. With their backward equipment being overused, their productive capacity has already reached the saturation point. During the present economic readjustment and reduction of the scale of capital construction, these enterprises, no longer able to expand their reproduction by the "extensive" method, can only resort to the "intensive" method. There should be specific measures for expanding reproduction by the "intensive" method; otherwise with the "extensive" method already ruled out and the "intensive" method only vaguely defined, nothing can be accomplished at all. A host of facts have proved that any units with specific measures for taking the "intensive" road and actively carrying out technical transformation and equipment renovation will be able to develop their production rapidly. The Shanghai Woolen Blanket Plant formerly produced acrylic fiber blankets. Output was low and quality was poor. The technicians at this plant studied the characteristics of acrylic fibers and renovated the production line. After the completion of the new production line, output increased by 80 percent and the up-to-standard rate was over 90 percent. Last year this plant produced 400,000 woolen blankets, and it expects to increase its output by a further 40 percent or more this year. The No 7 Woolen Textile Mill, formerly using outdated British machinery of the 1930's, operated at a slow speed and produced goods of inferior quality. The workers copied the features of the high-speed fine yarn machines used in woolen textile production and brought per-unit output up to the equivalent of 600 additional spindles, thus effectively tapping the potential for increased production. In the first half of this year, the total output value of the woolen textile trade in the municipality was increased by 5.5 percent over the same period of the previous year. The main reason for this increase was the renovation of equipment, which increased productive capacity. People in economic circles have held that greater efforts in technical transformation and equipment renovation will not only expand the productive capacity of the light, textile, and handicraft industrial enterprises but will also give impetus to machine industry production. Thus the input of heavy industry and the output of light industry will form a harmonious cycle. There are many industrial trades in Shanghai with very many old enterprises among them to be transformed. In order to renovate and transform these old enterprises in separate groups in a planned and systematic way, the relevant departments in charge have recently conducted investigations into three different trades--knitwear, food, and leather--and worked out plans for gradually popularizing the experiences of some typical examples. This action is very necessary.

Second, bring into play the strong points of Shanghai and expand export trade as a national concern.

Shanghai is located on the coast and has a long history of industrial development and a certain foundation of technology. Its export trade is very promising. The industrial goods of Shanghai must find their way into the world market. We should adopt the method of supporting exports with imports and using exports to draw in imports. With imported materials, we can produce high-grade products, promote our production, and expand our exports. We can also import advanced technology to raise our technological level in our production and to increase our competitive power abroad. We should try every possible way to enliven our exports and find a new road for our foreign trade. Because of the economic readjustment this year, plus the scarcity of domestic orders received, the shipyards of Shanghai for a while operated under capacity. Later, after studying the international market, they took timely action to direct their efforts in exports. To date, they have already received orders for 49 ships totaling 510,000 tons and worth more than 400 million dollars. When working out its production plans early this year, the Shanghai Machine Tool Company was confronted with many contradictions and difficulties. The company actively increased the production of goods in short supply and provided special standard equipment for the production of consumer goods in daily use. While widening its scope of service, it also expanded the export of its products in various forms. In addition to the small- and medium-size lathes and other traditional products which enjoy fairly good sales in the foreign market, it added many new varieties, in line with the requirements of foreign customers, and undertook the processing of customers' materials according to blueprints supplied. Thanks to these new export channels, lathe exports increased by more than 30 percent over last year's figure.

Third, conduct in-depth investigations to obtain a good knowledge of the market, and then organize production according to market demands.

In order for the products to sell well, it is necessary to step up investigations of the market and to have good market forecasts and various information feedbacks. We should be well informed of various market demands and keep abreast of market development. We should particularly bear in mind that the countryside, with a population of 800 million, is a vast market. Along with the continued development of agricultural production, the income of the peasants has been increased, and there is a change in the trend of spending in the countryside. This calls for systematic investigations and forecasts of the vast rural market. Having a clear knowledge of market conditions, after making thorough investigations, the work of readjusting our products will be easier and production will increase more quickly. The porcelainware produced in Shanghai for daily use was not well received in the market because of a lack of variety. After an investigation of the market, the Municipal Porcelain Vacuum Flask Company became aware of the excessive supply of plain color products in the market, whereas the great demand is for basins, large round plates, and other containers with floral designs. All the plants concerned accordingly produced porcelainware with many varieties and designs in addition to other goods in short supply. By the middle of May, various types of porcelainware for daily use had made their appearance in brand-new designs at the national goods-ordering meeting held in Changsha, and there was a spate of orders from customers from various localities. By now, the majority of plants and enterprises have shown great attention to market forecasts and investigations, but the scientific method of doing these jobs well still needs improvement through practice so that the investigations will result in correct guidance for the production enterprises.

Fourth, pay attention to the intermediate links in the economic chain and do a good job of solving various new problems that may affect the development of production.

Judged from the angle of reproduction, production, exchange, distribution, and consumption are all closely united to form a single entity. All of these links must be well coordinated so that they can be mutually supplementary; dislocation of any of these links may bring about serious consequences. Products should be readily marketable. Therefore, production plants must bear in mind not only the problem of sales but also the industrial-commercial and industrial-foreign trade relations, as well as the solution of problems of prices, profits, foreign exchange subsidies, and so forth arising out of these relations, in order to enlist support from the commercial and foreign trade departments. To increase production, the enthusiasm of the broad masses of workers must be counted on. Careful handling of the bonus question will serve to link the contribution of labor with material benefits and will further consolidate and raise the enthusiasm of the workers and staff members. Some machine tool companies that formerly operated under capacity are now, with the help of foreign trade departments, actively making contacts with foreign merchants and are processing foreign customers' materials according to the diagrams supplied. Now, the Fourth, Seventh, and Eighth Machine Tool Plants and the Shanghai Heavy Machinery Plant are also cooperating with foreign merchants in production. While increasing production and practicing economy, the porcelain vacuum flask trade has revised its bonus system and is now integrating profits with rewards in various forms, such as rewards for above-quota production in the form of piecework payments among the plants or workshops. Thus, rewards are combined with the various systems of responsibility to arouse the enthusiasm of the workers and staff members in production. These instances clearly indicate the urgent need for well-coordinated production, exchange, distribution, and consumption as a means of developing production.

More than half a year has passed already. Because of the difficulties encountered in the attempt to increase production during the first 7 months, the task for the remaining months will be ever more arduous. At present, all bureaus, companies, and on down to the basic-level units are actively carrying out readjustment. According to the requirements of the readjustment, many trades and professions are going through the process of industrial reorganization and integration of enterprises, with production of consumer goods as their central task. On the basis of reorganization and integration, they are also consolidating the enterprises, improving their business management, and carrying out technical transformation. To help resolve various contradictions more effectively and to further implement the policy of readjustment, the municipality has set up a three-level regulation system along with the restructuring of the economic management system around the task of readjustment. Various forms of economic integration--including integration between enterprises, between production, supply, and marketing, between industry and commerce, and between industry and foreign trade--will be actively and prudently carried out as long as these measures can be conducive to economic results. They will create favorable conditions for increased production in the next 5 months. The Sixth Plenum of the 11th Party Central Committee has in particular summed up the historical experiences following the founding of the People's Republic and has completed its historical mission of setting right the party's guiding ideology. The people's study and implementation of the spirit of this plenum will have an important bearing on production in the second half of the year. The leadership at various levels should clearly understand the current situation, take advantage of this excellent opportunity, fully mobilize the broad masses, and work fervently by making good use of the favorable conditions in order to boost production in the next 5 months and maintain a steady growth rate in this year's production.

SHANGHAI PLANTS PLAN PETROCHEMICAL COMPLEX

Shanghai JIEFANG RIBAO in Chinese 24 Jul 81 p 1

[Article by Li Zhenghua [2621 2973 5478]: "Breaking Away From Departmental Ownership To Establish a Petrochemical Complex"]

[Text] Li Zhenghua, NCNA correspondent, reports that 7 factories and one research institute in the Gaoqiao Area, Shanghai, have been trying to break away from "departmental ownership" and get ready to consolidate as the Shanghai Joint Petrochemical Enterprise in order to make better use of petroleum resources, to exploit all the production potential and to increase economic efficiency.

According to the findings and estimates of the Shanghai Municipal Bureau of Chemical Industry and the Shanghai Financial Research Institute, if the state invests a little over 200 million yuan for necessary expansions after the merger of these petrochemical plants, the annual output value of the Shanghai Oil Refinery and the Gaoqiao Petrochemical Plant alone will jump from their current level of 1.3 billion yuan to as much as 2 billion yuan. The annual profit they surrender to the state will jump from the current level of about 300 million to more than 700 million yuan.

Having won the attention and backing of the leading cadres of the State Council, the project is now placed under the unified guidance of the appropriate ministries of the State Council and the Shanghai Municipal People's Government. Judged in the light of international data, the value of petroleum increases 10 times when it is processed into petrochemicals. The value will increase 10 more times when the petrochemicals are turned into end-products. That is to say, when crude oil is processed twice, the value of its end-products increases 100 times that of the raw material. According to the findings of the Shanghai Financial Research Institute, in 1980 the Gaoqiao Chemical Plant was able to turn 15,540,000 yuan worth of crude oil into 162,440,000 yuan worth of petrochemicals. This is 10.45 times the value of the crude oil. But the value of its end-products fell far short of the standard.

Today, the Gaoqiao area of Shanghai has 7 petrochemical plants and other enterprises which depend on petrochemicals as their major source of raw materials. They are: the Shanghai Oil Refinery, the Gaoqiao Chemical Plant, the Second Chemical Fibers Plant of Shanghai, the Second Synthetic Detergent Plant of Shanghai, the Shanghai Pesticide Plant, the 15th Dyestuff Factory of Shanghai and the Shanghai Petrochemical Research Institute. In addition, there is the Gaoqiao Thermoelectric Power Plant which supplies these plants with steam and power. These enterprises are severally controlled by the Ministry of Petroleum Industry, the Ministry of Chemical Industry, and the Shanghai municipal bureaus of chemical industry, textile, light industry and electric power. Although these enterprises have become interdependent petrochemical processing units after years of mutual supply of raw materials and power as well as technological integration, the fact they are controlled by different departments still poses problems in actual production. Even enterprises within one department often find cooperation difficult because each has its own production and profit quotas to fulfill. The lack of coordination and reckless use of petroleum resources have led to severe waste of energy, wanton neglect of production potentials and poor economic efficiency.

Take the Shanghai Oil Refinery and the Gaoqiao Chemical Plant for example. The Shanghai Oil Refinery refines more than 4 million tons of crude oil a year, turning out principally fuel and lubrication oil. It also produces as it refines the crude oil nearly 50,000 tons of petroleum gas which may be turned into various chemical products. Instead of putting it to proper use, the petroleum gas is burned as fuel. The Gaoqiao Chemical Plant, just a few li away from the refinery, needs large quantities of petroleum gas to produce such chemicals as polystyrene, ABS engineering plastics and low pressure polythylene. Due to lack of raw materials and equipment, the Gaoqiao Chemical Plant is unable to produce enough of these chemicals. As a result, the state has to spend large sums of foreign exchange to import these chemicals. The Second Chemical Fibers Plant and the Second Synthetic Detergent Plant, both in Shanghai, depend largely on the Gaoqiao Chemical Plant for raw materials. However, due to "departmental ownership," the supply is so undependable that their production has suffered setbacks. Such waste of petroleum resources has been widespread within the chemical industry in the Gaoqiao area. Consequently 30-40 percent of the chemical industrial facilities are not used efficiently.

The Shanghai Municipal Bureau of Chemical Industry and the Financial Research Institute had studied the situation both last year and this year. They recommend the formation of a joint petrochemical enterprise for the Gaoqiao area of Shanghai so as to coordinate the production operations of all the related plants.

According to their recommendation, the first step of the merger is to set up a central petrochemical plant consisting of the Shanghai Oil Refinery and the Gaoqiao Chemical Plant. This will serve as a base to bring together the remaining related factories to form an integrated system of specialization units conducive to greater productivity. The complex is expected to become the second petrochemical center of Shanghai, a match for the other petrochemical center at Jinshan.

BRIEFS

SHANGHAI PRODUCTION TARGETS--Shanghai, 5 Sep (XINHUA)--Shanghai will overfulfill annual production targets by 100,000 bicycles, 100,000 sewing machines and 300,000 wrist watches in the remaining four months of this year, a spokesman for the municipal light industrial bureau said. This means Shanghai will try to achieve a six percent increase in its light industrial production, instead of five percent as planned at the beginning of this year. Additional taxes and profits turned over to the state at the year end will come to 40 million yuan (RMB). This latest move taken by Shanghai, China's biggest industrial center, mirrors the current national effort to bolster state revenues by increasing production and improving industrial management. A national forum on industry and transport called by the State Council, which closed September 1, called for still bigger increases in China's consumer production in the last four months of this year. CONSTRUCTION

SHENZHEN TO BUILD INTERNATIONAL AIRPORT

HK100244 Hong Kong STANDARD BUSINESS SUPPLEMENT in English 10 Sep 81 p 1

[Text] The Shenzhen Special Economic Zone (SEZ) will soon build its own international airport as well as a deep water port to cater to its increasing passenger and cargo flow to and from the outside world.

The Shenzhen municipal vice party secretary Cao Xizhi yesterday said the State Council of Beijing has given approval to the SEZ to build an international airport, either on its own or in cooperation with foreign investors.

Mr Cao did not reveal when the construction of the new airport will commence or the amount of capital involved.

Shenzhen sources said that a number of foreign consortiums has already contacted the Shenzhen authorities to discuss the possibility of cooperation.

Speaking at an opening ceremony of Shenzhen's first housing estate, Mr Cao also revealed that the Hong Kong Government has not approached Shenzhen authorities on the possibility of jointly building an airport to serve mutual needs.

The government is currently thinking of building a new airport in the new territories to replace the Kaitak airport.

The government, has hired a consultancy firm to study the feasibility of setting up a new airport at Cheklapkok, Lantau, while it also recruited another firm to do a similar study in Yuenlong near Deep Bay about three months ago.

This raised speculation that the government wants to build a new airport near the border to convince the Shenzhen authorities to abandon its own airport plan and use the airport facilities in Hong Kong.

In this way, Shenzhen would come to rely more on Hong Kong, enhancing the colony's future status.

Mr Cao's council has also given the go-ahead to build a deep water port at Chiwan, about 2.3 kilometers west of the Shekou industrial district of the zone to act as a cargo transaction terminal for both Shenzhen and other parts of Guangdong.

The housing estate Tungwulaiyuen (Tungwu Garden), which was opened yesterday, is a joint venture between the Shenzhen Realty Development Corporation, the property arm of the Shenzhen government, and a local developer, Millie's Group.

According to a Millie spokesman, the first two phases of the estate already completed consist of 216 units of 650 square feet and are sold at a price of $17-190,000 [figure as published] each.

LABOR STRUCTURE OF CITIES, TOWNS CATEGORIZED, ANALYZED

Beijing DILI XUEBAO [ACTA GEOGRAPHICA SINICA] in Chinese No 2, 1981 pp 121-133

[Article by Wu Youren [0702 0645 0088], Geography Department, Nanjing University: "Preliminary Study of the Labor Structure of City and Town Population in China"]*

[Text] By the labor structure of city and town population is meant the proportional relationship of various population categories to the total population of cities and towns. This includes the proportion of the non-agricultural population to the agricultural population, the ratio of the working population (staff and workers) to the total city and town population (non-agricultural population), and the proportional relationship among all categories of the working population. A study of the labor structure of city and town populations is, therefore, a study of the equitable proportions of all categories of population in different kinds of cities and towns following the objective laws of city and town formation and development.

Study of the labor structure of city and town populations is a major ingredient in the study of the many disciplines of urban economics, urban geography, and population geography. It is a research problem to which many countries in the world devote serious attention.

It is generally known that in order to meet the needs of political, economic and cultural development, the formation and development of a city or town "must expend varying kinds of and a certain amount of its total social labor force," and in every sector of the national economy "to distribute social labor in definite proportions."[1] If this social labor is distributed in improper proportions in the various sectors, the production of goods by each sector cannot be coordinated and moved along. Production and life will not then be able to be built in an integrated way, and commensurate development will not be possible in communications and transportation, or in education and culture. Comprehensive economic benefits from investment in capital construction will not be able to find full play, and there will be no orderly, smooth development of political, economic, and cultural life in cities and towns. Therefore, study of the labor structure of city and town population possesses definite theoretical and practical significance.

---

*Investigation and research for this article has received the vigorous support of the State Capital Construction Commission, the Municipal Construction Bureau, and of numerous provincial (prefectural) and municipal construction commissions (city construction bureaus and capital construction bureaus). In the process of writing and revising it, concrete guidance and valuable ideas were offered by comrades Liu Xuehai [0491 1331 3189], Wang Fan [3761 0416], and Xia Zonggan [1115 1350 3771] in the Urban Construction Bureau of the State Capital Construction Commission, by Comrade Liu Darong [0491 6671 1369] in the Municipal Construction Institute, by Comrade Sun Panshou [1327 4149 1108] of the Geography Institute of the Chinese Academy of Sciences, and by Comrade Song Jiaqin [1345 1367 3141] in my own department. Comrades Xu Yuming [1776 3768 6900], Xu Peisheng [6079 1014 3932], and Fan Xin [5400 0207] helped draw the illustrations, for which thanks is hereby expressed.

1. Categories of China's City and Town Population

Illucidation of the laws of development of the labor structure of city and town population in China requires, first of all, a rational categorization of city and town population.

Since Liberation, for purposes of urban planning in China, in order to make a sensible analysis of city and town population and project the scope of city and town population growth, city and town population has been divided on the basis of the growth of the "formation sector" and the "service sector" into basic population, service population, and the population that is being reared. By basic population is meant the staff and workers in the formation sector for the growth of cities and towns. This includes mostly staff and workers outside the city who are working in plants and mines, enterprises, government organizations, and schools. By the service sector is meant staff and workers in the service sector for the growth of the city, i.e. mostly those employees and workers in the city who are providing services to plants and mines, enterprises, government organizations, and schools. The population being reared means young people who have not yet reached working age, and children who have not yet reached school age; housewives engaged in labor at home, social youths, old people, and disabled people who have lost their capacity to work. Everybody has discussed these categories a great deal, and they merit further deep examination.

We believe that the classification of city and town populations must proceed from the fundamental premise of "distributing social labor into definite proportions," reflecting the objective laws of the formation and development of cities and towns, and the proportional relationships in distribution of the workforce. Generally speaking, the proportional relationships in the distribution of city and town workforces are manifested principally in the following several aspects:

1. The proportional relationships of the distribution of workforce between the production sector and the non-production sector. Cities and towns are an extraordinarily complex totality, involving the fields of politics, economics, and culture, and including all sectors of the national economy. They contain both industrial, agricultural, capital construction, and transportation, communications, and posts and telegraphs material production sectors, as well as the non-material production sectors of commerce, service trades, finance and trade, banking, municipal public utilities, culture and education, scientific research, medical treatment and hygiene, and administration and management. These are mutually restrictive and mutually supportive in their relationships to each other. Growth of the material production sector restrains the non-material production sector; however, the non-material production sector may also impair growth of the material production sector. Proportional relationships in the distribution of workforces between the two must be correctly handled.

2. Proportional relationships in the distribution of workforces between industry and other sectors. The material foundation on which socialist cities and towns depend for their growth is many sided, the major and most fundamental of which is industry. Therefore, the workforce requirements for city and town growth are determined principally by the level and scale of industrial growth, and these requirements are greatly affected by the growth of other sectors as well. In the distribution of city and town workforces, it is necessary, first of all, to take into consideration the needs of industrial development, and to correctly handle the proportional relationships in the distribution of workforces between industry and other sectors.

3. Proportional relationships in the distribution of some other workforces, such as the proportional relationship between heavy industry and light industry within industry itself; the proportional relationship among capital construction, communications and transportation, and the entire national economy; the proportional relationship among commercial services, public utilities, and the national economy; the proportional relationship between scientific research and building of the economy. All these are also major proportional relationships. If the proportional distribution of workforces among each of them is not coordinated, city and town production and life will be impaired.

4. Proportional relationship between the working population and the non-working population. Apart from the rural population that becomes the population of cities and towns, and apart from movement of population from one city or town to another, the principal source of the workforce in cities and towns is full tapping of the work potential existing within the cities and towns themselves. One way of doing this is to increase the labor productivity rate. Another way is to transform the non-working population into a working population. Within the population of cities and towns there is a constant shifting between the working and non-working population. This process is determined both by the level of production growth, and is also closely related to natural population increase. Therefore, it is necessary, on the basis of the natural laws of population increase in cities and towns, and on the basis of the laws of economic development, to accurately work out the proportional relationship between the working and non-working population to fully tap the work potential within cities and towns.

First we divided the population of the cities and towns of the country into the two broad categories of non-agricultural and agricultural population, after which we divided the population engaged in agricultural into the two categories of working population and non-working population. Then, depending on the nature of work of the working group, we divided the working population into nine categories, namely, industry, capital construction, agriculture-forestry-irrigation-meteorology, transportation - posts and telecommunications, commercial service - water supply, public utilities, science-culture-education-sanitation, banking, state organizations, and people's organizations. The first four of these have been designated as the productive working population (staff and workers), and the last five categories have been designated non-productive working population. (staff and workers)

(1) The Working Population (Labor Staff and Workers)

1. By productive working population is meant all the staff and workers involved in work in the sector that produces goods under a system of ownership by all the people or collective ownership. This includes the following several categories:

I. Industrial staff and workers including the workers, engineers and technicians, managers, service personnel and others working in various industrial sectors.

II. Staff and workers in capital construction including construction units, surveying and designing organizations, geological survey and construction planning organizations, and production preparation personnel.

III. Staff and workers in agriculture, forestry, irrigation, and meteorology including those working in units concerned with agriculture, forestry, animal husbandry, aquatic products, water conservancy, and meteorology, but not including suburban commune collective workers.

IV. Staff and workers involved in transportation and posts and telecommunications including all employees and workers on railroads, highways, water transportation, in port areas, in civil air transportation, and in posts and telecommunications.

2. By non-productive working population is meant all employees and workers in the non-material production sector. These include:

I. Commercial service and drinking water supply staff and workers, including all staff and workers in commercial, service, drinking water and food industries, and material supply and marketing units.

II. By urban public utility staff and workers is meant within-city staff and workers involved in public transportation, road maintenance, running water, coal gas, underground conduit care, orchard care, housing management, and environmental sanitation units. However, running water works and coal gas plants that are independent accounting units must be included under industrial units.

III. Science, culture, education, and hygiene employees and workers include staff and workers in units concerned with scientific research, culture, education, hygiene, broadcasting, physical education, and social welfare endeavors, as well as students in institutions of higher learning, middle schools, and technical schools.

IV. Staff and workers in banking units include those in the People's Bank and the Construction Bank system.

V. Staff and workers in state organizations and people's organizations are those in all echelons of state authority and administrative organizations, party organizations, and in supply and marketing cooperatives above the county level.

(2) The Non-Working Population (Non-working staff and workers, and people being reared)

1. Non-adults and old people beyond working age.

2. Women engaged in work at home, social youths, and others.

3. Those who have lost the capacity to work and are unable to engage in social collective labor.

We believe that the aforementioned categories of city and town population are fairly clear in conception and fairly accurately delineated. They are along the same lines as statistics on staff and workers in the city and town population of the country, are handy for statistical checking, and can fully reflect the proportional relationships of workforce distribution in cities and towns. They are helpful as a foundation for national economic planning, and for projecting the scale of city and town population growth. However, as a result of the direct application of statistical data, certain deficiencies also exist. For example, the productive working population contains a small amount of non-productive working population, and in the non-productive working population a small number of productive workers have been included etc. In addition, classifying scientific researchers as non-productive workers as well as the problem of how to handle students in institutions of higher learning and in middle and technical schools also merit further study.

2. Changes and Trends in the Growth of the Labor Structure of China's City and Town Population

With the building and consolidation of the socialist system in China since Liberation, and the flourishing development of socialist construction, which has changed consumer cities into producer cities, remarkable changes have taken place in the labor structure of the population of China's cities and towns. This has been manifested specifically as follows:

(1) Steady Increase in the Ratio of the Working Population

The proportional relationship between the working population and the non-working population is determined by the form of social production and the level of development of cities and towns, and is also affected by the natural increase in population and the age structure of the population. Establishment of the socialist system in China created the prerequisite conditions for full employment of city and town residents. As the socialist revolution and socialist construction burgeon, as consumer cities become producer cities, and as planned births are instituted, the ratio of the working age population continually increases.1) Thus the ratio of the working populace to the population of cities and towns steadily rises, and the proportion of the non-working population declines commensurately. In national terms, this means that during the period immediately following Liberation, the working population was in a ratio of almost 10 to 20 percent of the total population, or below 10 percent at minimum, and no more than 40 percent at maximum. Now, the ratio of the working population to the country's city and town population has risen to around 40 or 50 percent, or likely 50 percent but less than 60 percent.

(2) Industrial Staff and Workers, and Staff and Workers Engaged in Productive Labor as a Portion of Total Staff and Workers.

Following liberation of the country, an overwhelming majority of the more than 100 cities inherited from old China were consumer cities in which the ratio of industrial staff and workers and productive working staff and workers was very small,

---

1) For example, before instituting planned births in Nanjing, the natural population increase in 1953 was 25 percent, and the working age population amounted to 47 percent of the city's total. Following institution of planned births, the rate of natural increase in 1974 was only 5 percent, and the working age population was more than 55 percent of the total.

the former amounting to only about 20 or 30 percent, and the latter amounting to less than 50 percent. Even though the proportion of urban industrial and productive working staff and workers in some cities was fairly large, that was also the result of the lopsided growth of cities. For example, industrial staff and workers in Anshan during 1949 numbered about 70 percent of the total number of staff and workers, and staff and workers engaged in productive labor amounted to more than 90 percent of the total. However, staff and workers in cultural, educational, and commercial service units were a very small ratio and far from being able to satisfy the needs of working people's lives.

Since the founding of the People's Republic, as a result of numerous reforms in the former cities and vigorous growth of industrial and productive endeavors, the cities have become producer cities in which industry is dominant. As a result of the establishment in numerous newly built cities and towns of production bases, transportation hubs, or port facilities, development has taken place. As a result, in the labor structure of China's cities and towns, staff and employees in industry amount to about 50 to 60 percent, and staff and workers engaged in productive labor amount to between 65 and 85 percent. As a result of steady readjustment of the proportion of staff and employees engaged in productive labor relative to staff and employees engaged in non-productive labor in the cities that had formerly developed lopsidedly, the labor structure of urban population is becoming more and more rational.

(3) Rational Changes Within the Internal Structure of Non-Productive Working Staff and Employees

Non-productive working staff and workers may be divided into two general categories: One is the administrative and management sector which "is not directly related to production," such as the staff and employees in state organizations and people's organizations. The other is the sector "used to satisfy society's common needs," such as staff and workers involved in commercial services, culture and education, scientific research, medical treatment and hygiene, and municipal public utilities. With the establishment and consolidation of the socialist system and the growth of socialist construction, the ratio of the former working staff and workers in cities and towns gradually decreased while the ratio and number of the latter staff and workers gradually has risen on the foundation of the development of production. For example, in Shijiazhuang the ratio of the former group of staff and employees fell from 13.2 percent in 1949 to 4.7 percent in 1974, while the ratio of the latter group of staff and workers rose from 14.1 percent to 18.2 percent. In the labor structure of China's city and town population, the ratio of these two groups of non-productive labor staff and employees has shown a fundamentally identical tendency toward increase and decrease in each city and town, only the extent of change varying when the nature and size of the cities and towns are different.

(4) Staff and Employees in the System of Ownership by All the People Increasingly Achieving a Dominant Position.

Under the conditions of China's socialist system where the two forms of ownership by all the people and collective ownership by the working masses exist, there is a difference between staff and workers in the system of ownership by all the people and workers and staff of the system of collective ownership among workers and staff of city and town labor. Accompanying the great victory since liberation in the socialist transformation of capitalist industry, commerce, individual handicrafts and agriculture, which has vigorously developed the state owned economy to a priority position, in the working staff and employees of cities and towns the staff and employees in the system of ownership by all the people has steadily taken a leading position until they now account for from 70 to 80 percent or more.

In the period since Liberation, however, in urban construction and workforce distribution, understanding has been inadequate about the objective laws governing proportional workforce distribution for the development of cities and towns. As a result of the disturbance and destruction caused by the ultra-leftist line of Lin Biao and the "gang of four," in particular, there still exist some inadequately coordinated and not entirely rational places in the labor structure of China's city and town population. This is manifested principally in the ratio of the working population in some cities and towns not being high and the labor potential fairly great.

In industrial cities that have developed a single industry mining or heavy industry economy, in particular, this is especially conspicuous. In numerous cities and towns, the proportion of staff and employees in commercial services, and in the cultural and educational system tends to be small, and vacancies in city and town construction ranks are fairly numerous, impairing the coherent building of production and livelihood and causing numerous inconveniences and effects on urban political, economic, and cultural life. All this awaits further improvements.

In order to thoroughly modernize industry, agriculture, national defense, and science and technology within this century, and to build China into a powerful, modernized socialist country, the impact on the labor structure of cities and towns in the country will be extremely deep.

First of all, with the modernization of industry, agriculture, transportation and communication, and capital construction, a great increase in the labor productivity rate will occur in individual sectors, and great changes will take place in proportional relationship of the workforces in individual sectors. At the same time, numerous new sectors and industries will emerge, creating more superior conditions for the employment of city and town dwellers. Although great development will take place in industrial and production units, because of the modernization of production, the decrease in labor quota requirements, and the rapid increase in staff and employees in the non-productive sector, the tendency will be toward a gradual decline in their ratio.

Secondly, in the process of realizing the "four modernizations," there will be need for "extremely increasing the scientific and technical levels of all peoples," and the vigorous development of cultural, educational, and research endeavors. Cities, particularly large cities and exceptionally large cities, are places in which institutions of higher learning and scientific research organizations are concentrated, and where staff and employees in the cultural, educational, and scientific research sector will greatly grow. Their ratio to the total number of staff and employees will strikingly increase.

Third, from the foundation of great growth in productivity, material and cultural living standards of city and town residents will vastly increase, and there will be gradual socializing of the lives of city and town residents, plus a strengthening of economic management work, with a very great development of those sectors that satisfy the common needs of society, particularly medical treatment and hygiene, social services, municipal public utilities and travel. The ratio of staff and workers engaged in non-productive labor will tend to rise gradually.

Fourth, with the modernization of the transportation and communications industries, particularly the development of modern communications in the vast expanse of rural villages, and with the gradual building of integrated agricultural, industrial, and commercial enterprises, there will be a further intimacy in the relationship between city and countryside and a strengthening of the bonds between industry and agriculture. As a result, cities and towns will expand development of staff and workers engaged in non-productive labor in an increase of service trades and the promotion of commerce and service industries in rural villages.

Finally, accompanying growth in productivity and extremely great increases in the scientific and cultural levels of all peoples, will come more conscious practice of planned births, thereby effecting planned control of the natural rate of increase in city and town population. Consequently, the age structure of city and town population will undergo new changes, the ratio of working age population generally rising, and a definite decline occurring in the ratio of youths and pre-school age children. The lifespan of old people will steadily lengthen. Additionally, the socializing of household work, and the state's creating of conditions for full employment of city and town residents will mean that the future ratio of the working population to the total population will be properly increased.

In some presently industrially advanced countries, industrial staff and employees make up only 30 or 40 percent of the working staff and employees of cities, while staff and employees engaged in commerce and service trades amount to from 40 to 60 percent, exceeding the ratio of those engaged in industry (See Table 1). Though there are many irrational aspects in these countries owing to private ownership of the means of production; nevertheless, they reflect the trend in development of the labor structure of city and town populations. Scientific researchers amount to between 2 and 5 percent of the total population in numerous countries, scientists and engineers accounting for between 1 and 2 percent of this. In large cities and especially large cities, the ratio of scientific researchers to the population is even greater.

Since the 1960's, as science and technology has advanced by leaps and bounds, and economic endeavors have burgeoned, many scholars abroad have done a great deal of forecasting about the trends of future world developments, including devoting a great deal of attention to an analysis of changes in the vocational structure. There is general agreement that "profound changes" will take place in the vocational structure of the population, and that "looked at over the long range, more people will be involved in service trade work." It is estimated that by the year 2000, those involved in the service trades will amount to 80 percent of the total number of people employed (those engaged in goods production and the agricultural sector amounting to 10 percent)." Moreover, "with expansion in the use of technology to spread the field of automation, greater requirements will be placed on vocational skills. The number of people directly involved in the production process will decline, while at the same time the requirements placed on those who organize technological progress will increase. This trend may be looked at both in terms of the proportional relationship between the numbers of workers and staff, and in terms of the requirement for greater numbers of personnel with higher educations to undertake the work."[2] Such a tendency is becoming increasingly manifest in the highly industrialized nations of the world. This prediction accords with the laws of development of scientific and technical progress. Naturally, by the year 2000, the actual proportion of the vocational structure and the labor structure of city and town population will require further study. Furthermore, because of different social systems, unequal levels of development of productivity and speeds of increase in labor productivity, and because of differing national circumstances, the vocational structure as well as the labor structure of cities and towns in individual countries have their own individual characteristics.

On the basis of the aforestated understanding, in the process of realizing the "four modernizations," China must constantly readjust the labor structure of its city and town population, gradually increase the ratio of staff and employees in commercial and service trades, in municipal public utilities, in culture and education, and in scientific research, commensurately reducing the proportion of staff and employees in industry and such goods producing sectors, opening new sectors and trades, and equitably increasing the employment rate of city and town population on the basis of requirements for a sensible combination of specialized and comprehensive development. In view of the present state and existing problems in the labor structure of China's city and urban population, and considering the huge effects of the "four modernizations" as well as the process of urbanization of the country, its vast size and huge population, we propose that during the near term (1985), that the ratio of the working population in the labor structure of city and town population be around 45 to 55 percent, that industrial staff and employees amount to between 40 and 60 percent of the total number of staff and employees, that staff and employees engaged in productive labor amount to 65 to 75 percent, and that staff and employees engaged in commerce and the service trades, and in science, education, culture, and hygiene amount to between 10 and 15 percent of total staff and employees. For the long term (the year 2000), the ratio between industrial staff and workers and staff and workers engaged in productive labor should decline by a suitable amount, while the proportion of staff and workers engaged in non-productive work, particularly staff and workers engaged in science, education, culture, and sanitation should increase commensurately. However, the labor structure of the population of different kinds of cities and towns should not be the same. This is elaborated below.

Table 1. Staff and Worker Labor Structure of Some Cities of the World*

	Number of Staff & Workers (thousands)	Staff & Worker Ratio (%)	Ratio of Staff & Workers in Commerce (%)	Ratio of Staff & Workers in Service Trades (%)
Tokyo	5,368	30.8	30.5	14.2

3. Characteristics of the Present State and Equitable Proportions of the Labor Structure of Different Kinds of City and Town Population in China

There are general laws applying to the formation and evelopment of the labor structure of city and town population in China, but different cities and towns have their own individual characteristics. These are determined by the nature of the city and town, and are greatly influenced by the size of the city or town, its level of development, and its composition. Experience has shown that because of the different nature of cities and towns, their position and roles in the political, economic, and cultural life of the country and the region differ. The "various different kinds of and different amounts of society's total labor force," required for development also differ; thus the labor structure of the population of each city has its own characteristics. Cities and towns having the same nature, even though different in size, will show like characteristics in the labor structure of their populations. When cities and towns have identical natures but their sizes are different, their levels of development not identical, and their composition not the same, the population of cities and towns will show definite differences only in certain places in their internal labor structure. For example, Nanjing is an especially large city with a population of 1 million, while Jinan is only a large city with a population of 500,000. Inasmuch as both are the location of provincial capitals and are centers of politics, economics and culture for the entire province, the ratio of their working population to the total population of the city, the proportion of their productive working population and their non-productive working population, as well as the ratio of the number of staff and workers engaged in industry, in commerce, in service, in science, education, culture, and hygiene are virtually identical. As another example, Jixi and Shuangyashan are both cities where the coal mining industry is dominant. Though the former is a city of more than 500,000 people, and the latter has a population of less than 200,000, the labor structure of the urban population in both is virtually identical. Still another example is Yueyang and Zhenjiang, both of which are prefectural political, economic, and cultural centers, and major water and land transportation centers. The proportion of their populations engaged in productive labor to those engaged in non-productive labor is virtually the same. It is only because Yueyang is a city in the process of development that the ratio of staff and employees engaged in industry is lower than for Zhenjiang. (See Table 2 for details). Other kinds of cities and towns are similar. Therefore, in analyzing the labor structure of the population of different kinds of cities in China, it is most important to make an analysis on the basis of the city or town's nature and to consider the effects of its size, level of development, and composition.

In short, on the basis of their position and role in the political, economic, or cultural life of the country or of a region, China's cities may be divided into three basic categories: cities that are national or regional centers of one kind or another; cities that have a predominantly economic function of some kind, including cities in which industry or transportation and communications dominate; and cities in which some special function is dominant (such as revolutionary memorial sites, border defense, and sightseeing cities). However, numerous cities possess functions of several kinds, and thus the kinds of cities and towns are complex and varied. Here emphasis has been given only to analysis of the characteristics of the present labor structure of major kinds of city and town populations, with some preliminary proposals being put forward for future equitable proportions.

(1) Cities That Are National or Regional Centers of One Kind or Another

These include Beijing, Shanghai, and Tienjin, three cities directly subordinate to the central government, as well as all provincial capitals, and capitals of autonomous regions. Since these are political, economic, and cultural centers for the entire country, an entire province, or an entire prefecture, production and service facilities are fairly well developed, and conditions for the employment of urban residents are good. In addition planned birth work has been taken fairly firmly in hand; planned control has taken place in the natural rate of population increase; and the ratio of the working age population to the total population of these cities is generally more than 50 percent; consequently, the working population amounts to about 45 or 50 percent of the total urban population. The working population in government organizations, people's organizations, commerce and service trades, and science, education, culture, and sanitation is fairly large, while staff and workers in industry amount to only 45 to 50 percent or so. The population engaged in productive labor amounts to between 65 and 75 percent of the total working population. However, owing to differences in size as well as differences in the levels of development, the ratio of staff and workers in industry, of capital construction, commerce, service trades, and cultural, and education staff employees is somewhat different. (See Graph 1).

On the basis of representative sampling done in the cities of Nanjing, Shijiazhuang, and Nanning, in these kinds of cities when staff and workers doing productive labor exceed 70 percent, while staff and workers engaged in commerce and the service trades, and in science, culture, education, and hygiene number less than about 10 percent each, it is generally felt that the proportion of staff and workers engaged in productive labor is slightly high while the ratio of staff and workers in non-productive labor such as commerce and service trades, and in science, culture, education, and hygiene tends to be low. For example, in 1974, staff and workers engaged in productive labor in Nanjing numbered 74.3 percent, while staff and workers engaged in commercial service and in science, culture, education, and hygiene numbered 11.5 and 10.2 percent respectively; however, this proportion was felt to be somewhat low. In addition, commerce and service facilities were overly concentrated, causing numerous inconveniences for the material and cultural life of urban residents. On the basis of the aforestated situation, and in consideration of future growth, it is proposed that the ratio of staff and workers engaged in productive labor, in the short term, be 60 to 70 percent of all staff and workers, that industrial staff and workers amount to 40 to 45 percent; that commercial service staff and employees amount to between 10 and 15 percent, that staff and workers engaged in science, culture, education, and hygiene be more than 10 percent.

(2) Predominantly Industrial Cities

This category of city may be one of two kinds. The first is a city where processing industries are fairly well developed, and the second is a city in which extractive industries are dominant.

1. Cities in which processing industries are fairly well developed. This includes cities where metal smelting, petrochemical industries, machine manufacture, and processing of farm products predominate. According to statistics, employment is rather full in this kind of city (the working population being about 50 percent of total population); staff and workers in industry amounting to more than 55 percent of the total number of staff and workers; the population engaged in productive labor amounting to between about 75 and 85 percent, which is higher than that in the category of cities next above. However, as a result of differences in size, or differences in level of development, or different composition, some places in the labor structure of city and town population differ. In the case of the two developing cities of Baotou and Shiyan, the productive working population is 79.5 and 86.4 percent respectively, and staff and workers in industry number only 52.4 and 58 percent respectively. Meanwhile, staff and workers in capital construction number 30 and 15.3 percent respectively, higher than the ratio in similar types of cities in the country. As another example, Qiqihaer, though a city in which the machine manufacturing industry is dominant, since it is a city with three satellite towns, commerce and service trade staff and employees account for 14.8 percent, more than twice the percentage of other cities of the same kind (See Graphs 2 and 3).

Cities in which extractive industries predominate are characterized by having numerous sites distributed over an area, and this has a very great effect on the labor structure of the urban population. For example, in cities where extractive industries predominate, the employment rate for residents is only 35 to 45 percent, and in numerous cities it is only about 30 percent. However, industrial staff and workers number more than 65 percent, and the productive working population is about 75 to 80 percent. Of all city types, this is the one in which the proportion of industrial staff and workers and productive working population is the highest. (See Graph 4 for details).

Graph 4. Labor Structure of Coal Mine City and Town Populations

In this sort of city, one of the main problems existing in the labor structure of the population is that the ratio of productive working staff and workers is fairly high. Whenever productive working staff and workers amount to more than 85 percent, and industrial staff and workers exceed 70 percent, production and life cannot develop in coordination. That numerous cities have busied themselves during the past several years in the readjustment of the proportions between industrial staff and workers and other staff and workers, and between staff and workers engaged in productive labor and staff and workers engaged in non-productive labor in order to meet the needs of urban development is a powerful testimony to this. For example, before Liberation as a result of lopsided development, the industrial staff and workers in Anshan amounted to 80 percent of the population, and the staff and workers engaged in productive labor amounted to 92.8 percent. Ever since liberation, readjustments have been made in these proportional relationships. By 1965, staff and employees engaged in industry numbered only 69 percent, and staff and employees engaged in productive work numbered 81.8 percent, substantially meeting the needs of urban production and life. Later, as a result of the disturbances and destruction caused by the ultraleftist line of Lin Biao and the "gang of four," the ratio between staff and workers engaged in industry and staff and workers engaged in productive work gradually rose (See Table 3), entailing great inconveniences for urban residents and the livelihood of staff and employees, and conversely impairing development of production.

Table 3. Changes Since Liberation In the Labor Structure of the Population of Anshan

1 年　代	2 劳动人口占总人口比重(%)	3 工业职工占职工总数比重(%)	4 生产性劳动职工占职工比重(%)
1949	46.6	83.0	92.8
1952	39.0	64.5	90.6
1957	33.0	58.0	84.7
1962	35.4	74.5	83.5
1965	35.0	69.0	81.8
1970	–	76.3	85.2
1973	51.5	74.9	85.4
1974	56.9	71.0	81.9

Key:
1. Year
2. Working Population As a Ratio (%) of Total Population
3. Industrial Staff and Workers As a Ratio (%) of Total Staff and Workers
4. Staff and Workers Engaged in Productive Labor As a Ratio (%) of Staff and Workers

Yet another problem in the labor structure of populations in this kind of city is the uncoordinated development of heavy and light industry. In cities where there is little other than heavy industry, and in mining cities, because production is pretty much of a single kind, employment opportunities for urban residents, and particularly for housewives, is rather scant, and the ratio of working population tends to be low. Statistics from nearly 159 cities and towns throughout the country show that in cities and towns where the working population is below 40 percent of the total population, about three-fourths of such cities were mining cities or cities in which there was little other than heavy industry. In numerous coal mining cities, the working population was only about 25 to 30 percent. This seriously hurt the economic income of the families of staff and workers and their real standards of living, brought about a relative gap between male and female staff and workers, made for difficulties in getting married, or because the coefficient of those with dependents tended to be low, staff and employees returned to the countryside for long periods to visit relatives to the great impairment of urban production.

In view of the above, in order to meet the needs of the "four modernizations," and over the short run, industrial staff and workers should be no more than 65 percent of staff and workers; workers and staff engaged in productive work should amount to 75 to 80 percent; staff and workers engaged in commerce and service trades should number 5 to 10 percent, and staff and workers engaged in science, education, culture, and sanitation should amount to about 5 percent. At the same time, attention should be given to coordinated development of light and heavy industry, and efforts made to increase the ratio of the working population.

(3) Cities in Which Communications and Transportation Are Dominant (specifically, cities that are regional centers or communications and transportation hubs).

These are characterized by having a high ratio of transportation, posts and telecommunications, and commerce and service staff and employees. In national terms, staff and workers engaged in transportation, posts and telecommunications amount to less than 10 percent, while in this category of city they are more than 10 percent, and in some cities greater than 15 to 20 percent. Therefore, the ratio of productive working population is the same as in industrial cities. Because the level of industrial development and the size of cities of this kind differ, the ratio of the working population in each differs greatly. For example, in Lianyungang, Zhanjiang, and Qinjiang, each of which is a developing city, the levels of industrial production are not high; therefore, the ratio of the working people is lower than the general level of this category of city. (See Graph 5).

Graph 5. Labor Structure of Regional and Communication Center City Populations

In this category of city, the ratio of the transient population is fairly large. It is generally about 1/10 to 1/30 of the total population of the cities and towns. In addition, such cities are frequently prefecture (autonomous zhou, or league) political, economic, or cultural centers, and staff and workers engaged in nonproductive labor such as drinking water supply, science, culture, education, and hygiene are a fairly large ratio. Representative sampling done in Yantai, Yueyang, and Zhenjiang shows that whenever staff and workers engaged in productive labor exceed 80 percent, those engaged in commercial service and water supply are as low as 10 percent, and staff and employees engaged in science, education, culture, and hygiene are less than 6 percent, urban production and life seem out of kilter. For example, since liberation, as Yueyang City in Hunan Province has changed from a consumer city to a producer city, the ratio of staff and workers engaged in productive labor has increased year by year. However, when it exceeded 80 percent in 1972, there was a sense that production and livelihood were insufficiently coordinated, so a steady readjustment was begun. By 1976, it had declined to 79 percent;

however, it was still felt that the ratio of staff and workers in commerce and service trades, and in science, education, culture, and hygiene tended to be low (the former being 9.1 percent, and the latter being 6.3 percent) (See Table 4). Currently hotels and inns are fairly crowded, and about an average of 1,000 persons per day pass the night in the railroad station or at the pier. Because of a lack of commercial service facilities at Chenglingji, Yangtze River passenger ships have stopped docking there, causing great inconvenience for the broad masses of passengers. In addition, public cultural and welfare facilities cannot satisfy actual needs.

   Science, Education, Culture, and Sanitation Staff and Workers
   Banking Staff and Workers
   State Organizations and People Organizations Staff and Workers
   Sub-total
8. Other

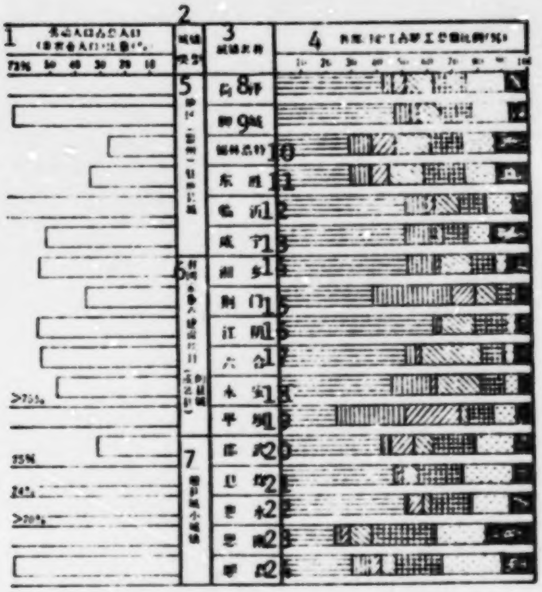
In view of the foregoing, in the short run, this category of city should have about 45 percent of its total staff and workers employed as industrial staff and workers; about 70 to 75 percent as staff and workers involved in productive labors; somewhat more than 10 percent in commercial service trades; and between 5 and 10 percent as staff and workers in science, culture, education, and sanitation. This category of city does a fair amount of production and its employment base is fairly broad; thus, it is proposed that in the short term the working population should be figured at 55 percent.

(4) County Seats and Small Cities and Towns

This category of city has two fundamental characteristics: (1) It is a city with links to the widespread rural villages, and it possesses a natural relationship with the farflung rural villages. The ratio of industrial and farming households is fairly large, staff and employees having dependents with them are fairly few; consequently, the ratio of working population to total population may be higher than 60 percent. (2) It is a center of politics, economics and culture for the entire county, and the non-productive population is fairly large; however, the level of industrial development is not high, those employed as staff and workers in industry amounting to only 30 to 40 percent, and the productive working population amounting to usually less than 65 percent.

County seats and small cities and towns are numerous and broad in area, and are of diverse types. Some are seats for prefectures (autonomous regions or leagues); some are areas for key national construction projects; some are major communication centers and centers for the concentration and distribution of goods; some are in counties on the outskirts of large cities; and some are just ordinary county seats. Because of differences in characteristics, or differences in size, or differences in levels of development, the labor structure of each city and town has its own individual characteristics. (See Graph 6 for details).

A representative sampling shows that county seats and small cities or towns that are the locations of prefecture (or autonomous zhou or league) seats (such as Yancheng in Jiangsu Province, or Hengshui in Hebei Province) have labor structure characteristics that are fundamentally the same as national or prefectural urban centers. County seats or small cities or towns that are the site of major national industrial construction projects, or are major communications centers (such as Chengjiang in Jiangsu Province or Xiangxiang in Hunan Province), as well as small cities and towns in suburban counties surrounding large cities (such as Liuhe Town at Nanjing) have labor structure characteristics similar to those of cities that are predominantly industrial or are predominantly communications and transportation hubs. Because their levels of industrial development are relatively low while they are political, economic, and cultural centers for the entire county, the ratio of their commerce and service trades and of their science, culture, education, and hygiene staff and workers will be higher. Therefore, in working out an equitable proportion for the short term labor structure of the population of county seats and small cities and towns, corresponding cities should be consulted.



Graph 6. Labor Structure of Various County Seats and Small Cities

Key:

17. Liuhe
18. Yongan
19. Pingba
20. Shaowu
21. Xifeng
22. Huishui
23. Sinan
24. Shunchang

Equitable proportion of the labor structure of the populations of ordinary county seats and small cities and towns. In considering the natural relationship between such cities and the farflung rural villages, whether the city is a hub for the rural villages or an outpost for the support of agriculture, in comparison with other cities and towns, worker and peasant households are usually fairly numerous, the proportion of those having dependents fairly low, and consequently the ratio of the working population may be figured at 50 to 60 percent.

Ordinary county seat and small city and town commerce and service trades, as well as the services provided by cultural and educational endeavors extend to every commune in the entire county. The scope of day to day commerce and service also touches on rural villages from 10 to 20 kilometers distant. Along with the development of modern transportation endeavors will come an enlargement in the scope of the area of contact. In addition, the industry being predominantly local state owned or run by labor collectively, there will be a definite ratio of both industrial and agricultural staff and workers. Thus, in terms of city and town population statistics, industrial and productive workers and staff should be lower than for ordinary cities. It is recommended that for the short term, these be figured at 40 percent and 65 percent respectively.

(5) Cities in Which Some Special Function Predominates

Generally speaking, in such cities, the ratio of the industrial staff and workers, and of productive working population is less than in any other kind of city. Industrial staff and workers amount to less than 40 percent, and the productive working population is less than 65 percent for the most part. Except in the case of border defense cities, staff and workers engaged in commercial service amount to slightly more than 10 percent.

There are a fairly large number of different kinds of this category of city. They may be divided into tourist cities, places with revolutionary memorials, or important national defense or border defense areas or towns. Generally, the ratio of industrial staff and workers and workers and staff engaged in productive labor is 40 percent and less than 65 percent. Except for important military towns, commerce and service trade staff and workers should be somewhat more than 15 percent.

'JINGJI YANJIU' ON BUDGET DEFICIT, INFLATION

HK210318 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 8, 20 Aug 81 pp 41-46

[Article by Dai Yuanchen [2071 0954 2525]: "The Socialist System Can Effectively Check Inflation"]

[Text] In 1979 and 1980, there were rather large deficits in our country's budget. As a result, depsite the growth in our country's industrial and agricultural production and the rather big improvements made in market supplies, commodity prices went up by varying degrees; there was a definite increase in the volume of money in circulation; and inflation reappeared. In other words, simultaneously with the emergence of a stabilized economic situation, dangers were still lurking. At the end of 1980, the Central Committee of the Chinese Communist Party issued a call for a further readjustment of the national economy and further political stability. A series of positive measures were adopted for the purpose of balancing the budget as well as achieving balance in the receipt and outflow of credits and loans. Strenuous efforts were made to curtail inflation in order to achieve commodity prices stability and general economic stability. People speculate as to why inflation has occurred in our country and if there are any positive measures which can be taken to stop inflation. It is necessary to obtain a clear understanding of these matters.

Resorting to Inflation to Stimulate Economic Growth has Caused Capitalist Nations to Suffer From the "Stagflation" Disease of the Coexistence of Inflation and a Stagnant Economy

According to the prevalent Keynesian theories, a small dose of fiscal deficit plus a mild form of inflation will help in stimulating the growth of production, bringing about only minor side effects. Whether or not this view is rational must be determined from an examination of the experiences in Western countries which have utilized such Keynesian theories for a prolonged period of time.

A look at the current global situation reveals that inflation is definitely a general phenomenon sweeping through various Western nations and fiscal deficits are really commonplace occurrences. In the United States, over the 35 fiscal years after World War II from 1946 to 1980, 27 of them are found to have had budget deficits while only 8 of them had a budget surplus. The gross budgetary deficits over these years reached the colossal figure of some $411.7 billion. In Britain, over the 28 years from 1951 through 1978, budgetary surpluses were recorded in only 3 years, namely, 1962, 1969 and 1970, while the remaining 25 years had budgetary deficits. The net accumulated budgetary deficits reached the staggering total of 40.9 billion pounds. Likewise in Japan, in the 26 years from 1951 to 1976, only 5 of them had budget surpluses, while the remaining 21 fiscal years had fiscal deficits. The gross accumulated fiscal deficit reached a total net figure of $66.5 billion. Nearly all the capitalist countries experienced deficits in their budgets, and inflation has been prevalent.

The experiences over more than 30 years in the Western world in carrying out the measures of having budgetary deficits and inflation have passed through two different stages of development.

Originally, the Keynesian theories were developed at a time when economic crises of a capitalist nature and threats of unemployment were frequent occurrences. Keynes admitted that the shortage of "effective demand" was a chronic and stubborn ailment of the capitalist system. Consequently, he urged the state's interference in the economic field by allowing the state to expand its financial receipts and disbursements and take up the burden of making direct investments in order to stimulate "effective demand" and to increase employment. The Keynesian theories do not, and cannot, basically solve the dilemma of overproduction and insufficient demand characteristic of capitalism but serve merely as a lifesaving tonic and as "the only way to avoid the total destruction of the current economic structure," to quote from his letter to Bernard Shaw. The Keynesia theories were first adopted at the time of American President Roosevelt's New Deal and in fascist Germany. After the World War II, they became generally popular and were considered as a good tonic for fighting an economic crisis and for stimulating economic growth. In the beginning, their adoption seemed to have produced good results and over a period of nearly 20 years a low inflation rate and a high speed of economic growth coexisted. In particular, at the time of President Kennedy's and President Johnson's administrations, fiscal deficits and inflation seemed to have worked miracles and the capitalist economy appeared to be perpetually prosperous. At the time, Hansen, an American economist, boasted in the following terms: "The financial policy of Keynesianism is not a one-sided inflationary policy which can 'cure' economic crises but also represents a comprehensive scheme which can 'iron out' the economic vacillations of capitalism, completely eradicate economic crises and eliminate business cycles." (Hansen: "Financial Policy and Business Cycles," cited in "Critical Comments on Financial Theories of the Capitalist Class," edited by the Research Office on Finance and Money, Economics Department of Xiamen University, Shanghai People's Publishing Press, p 130) Here, the claim that inflation could stimulate economic growth appeared to be a prevalent adage in an intoxicating "honeymoon" period.

Unfortunately, it did not take long for mild inflation to gradually evolve into inflation of a serious magnitude. By the 1970's, particularly with the eruption between 1974 and 1975 in the capitalist world of the most extensive and most serious postwar economic crisis, there came into being the "stagflation" situation of the coexistence of a high rate of inflation and low rate of economic growth. In the United States, between the years 1961 and 1970, the average yearly increase rate of the volume of money in circulation exceeded the gross value of domestic production by only 0.5 percent. Between the years 1965 and 1972, the volume of monetary supply (M2) increased yearly by 8.2 percent, but the rise in the prices of consumer goods was only 4.3 percent. By the years 1974 to 1978, the average yearly increase in the gross value of domestic output was 2.3 percent but the average yearly increase in the volume of money supply was 6.8 percent and the average yearly increase in the prices of consumer goods was 7.3 percent. Over the last 2 years there has appeared a double-digit increase in inflation and in commodity prices. The same situation is found in other capitalist countries. In these countries, the speed of increase in the volume of money in circulation far exceeded the rate of increase in the gross value of domestic output: in Britain, it was 21 times; in West Germany, 4.9 times; in France, 3 times; and in Japan, despite the strenuous efforts made to keep the issuance of currency under control, it was still 2.5 times. Meanwhile, the rise in commodity prices was even faster. In the principal capitalist countries, between the years 1971 and 1978 the index showing the rise in the prices of consumer goods went up by 8.1 percent, but by 1979 and 1980, outside of Japan and West Germany, the rise in the price index reached a double-digit figure. This made the populace extremely dissatisfied. As a result, there appeared the tendency of giving preference to purchasing material goods rather than to saving currency. A mad scramble to make crash purchases of goods was made. Interest rates were high and investments in general were sizably reduced. All these contributed to intensifying the unstable development of the economies of the Western nations. As for the developing nations, the great majority of them suffered an inflationary rate in excess of 20 percent, some reaching even 50 percent, due to various reasons such as the comparatively backward state of their economies, their frail financial structure with their fiscal expenditures frequently exceeding their receipts, and the principal capitalist states passing on to them the bad effects of the rise in crude oil prices and of inflation. Their difficult situation was thus aggravated.

Hence, people nowadays no longer sing any songs in praise of inflation. Instead, they now frightfully call the inflation of the 1970's, like the economic crisis of the 1930's, "economic earthquakes," devastating prosperity and progress.

Capitalist economists and even economists of high repute have been frequently puzzled by this development. They have described it as a "money printing machine phenomenon," or a "habitual occurrence," or as lashing of the waves caused by the oil-exporting countries attempting to protect their interests by raising the price of crude oil, or as the impetus wrought by the workers struggling to maintain their standard of living and to obtain higher wages. Nevertheless, when an analysis is made on the basis of Marxism, it becomes clear that fiscal deficits and inflation cannot solve the inherent contradictions of capitalist economy and that, to the contrary, the economic development stimulated by it will only widen the disparity between production increase and insufficiency in consumption on the part of the broad masses of people. In an economy characterized by the private ownership of the means of production and a highly socialized type of production, fundamentally speaking they only serve to prepare the ground for the eruption of even more serious crises of overproduction which in turn necessitate even larger doses of fiscal deficits and inflation. As a result of this seemingly endless cycle, capitalist economy has contracted this disease of "stagflation."

At present, Western nations no longer initiatively invoke the policy of fiscal deficits and inflation. Instead, they are generally adopting a retrenchment policy calling for the strict control of currency flotation and for high interest rates and have taken on the checking of inflation and the checking of the rise in commodity prices as the main tasks. However, seen from the standpoint of macroeconomics, they are in a situation characterized by a relatively slow or stagnant growth of the economy, a high rate of inflation, rapidly rising commodity prices, and a high rate of unemployment, all of which are interwoven and coexist with each other and keep each other in check. At the same time, the danger of overproduction and the danger of an economic crisis are interwoven and permeate each other. Regarding finance, they must maintain huge defense outlays in order to seek hegemony and at the same time must maintain huge expenditures on social programs for the sake of easing the existing contradictions. Although there has been much blowing of the horn calling for budget reductions, yet in reality little leeway has been left for accomplishing this objective. Due to all these factors, the governments of the various capitalist countries, while announcing time and again their intention to curb inflation, have found themselves subjected to pressure from various quarters and forced to adopt various contradictory measures, unable to stick firmly to their decision to curtail the issuance of currencies. This was mainly due to the facts that different interest groups have entertained variant views concerning the economic objectives and the order of their priority, various estimates made of the economic effect of the policies adopted differed from one another, and views diverged on what measures or steps should be taken. Thus, the economic and social council of the United Nations, in its "1979-1980 World Economic Investigation Report," reluctantly admitted: "Neither the slowing down of the speed of economic development in 1980 nor the recovery of economic growth from 1981 to 1982 can engender a clear-cut downturn in the rate of inflation in countries with developed market economies."

The sustained development of inflation in the Western nations indicates that the volume of money in circulation will continually exceed the normal volume of money required for the reproduction process. This will bring about an incessant rise in commodity prices, lead to an incessant devaluation of currencies and thereby necessitate a redistribution of the national income and the wealth of the society, thus causing widespread damage to the interests of the workers, peasants and all consumers alike. Samuelson once said: "The rise in commodity prices is frequently accompanied by a high employment rate; hence controlled inflation is likened to the full lubrication of the wheels of industry." ("Economics," 9th edition, p 272) Praising inflation in such flattering terms is strictly of a "class" nature. To be sure, owners of enterprises will naturally find inflation a good thing but it may not be so to the broad masses of workers. The rise in commodity prices will lower their real standard of living and in order to maintain their real wages they will have to engage incessantly in struggles which may be likened to "continually building bridges across vanishing streams." At present, governments of Western nations have avowed their intention to fight against inflation. However, on account of various contradictions, it is really difficult to bring a halt to inflation.

Inflation Is Not Inherent In Our Socialist Economy But Caused by Our Errors in Work

The superior character of the socialist economic system of our country enables the state to organize in a planned manner the balance of fiscal receipts and expenditures. There does not exist the objective necessity, on account of fiscal deficits, to invoke inflation to stir up demand. As we all know, the cause for the development of inflation in capitalist countries may be ascribed to the contradiction between private ownership and the socialization of production, and to the exploitation of labor by capital resulting in the insufficient power to purchase on the part of the broad masses of workers. This in turn results in the dilemma of production development caused by a relative demand shortage which necessitates the employment of a deficit policy to stimulate and engender effective demand and the resort to inflation to solve the dilemma of overproduction. On the other hand, in our country the ownership of the means of production and the socialization of production are not contradictory to each other. The distribution and redistribution of the national income are arranged and adjusted by the state according to plan. Based on the innate nature of our system, there cannot appear any relative insufficiency of effective demand, nor will there appear overproduction. There is no need for expanding effective demand by means of budget deficits, and we are entirely capable of bringing about, in a planned manner, the balancing of aggregate demand and aggregate supply. The sphere of the financial distribution and operation of our country is also different from that of capitalist countries. The reason capitalist countries carry out the policy of budgetary deficit and inflation is to interfere with and readjust the economy. On the other hand, our country's finance takes a direct part in the general distribution process. The state directly organizes economic activities. There is no need to resort to inflation to carry out readjustment. Hence, in our country there does not exist the objective certainty of the generation of fiscal deficits. In fact, we can entirely organize, according to plan, the balancing of financial receipts and disbursements and achieve a balance by means of increasing receipts and curtailing disbursements.

Historical records show that as early as the beginning of 1950 our country had already performed the miracles of eradicating fiscal deficits and curbing inflation. What old China bequeathed to us was a despicable legacy of vicious inflation of long standing under which commodity prices rose steeply several times a day and people could hardly make a living. In the early period after the liberation, the government could not find time to attend to the problems of budgetary deficit and inflation. Besides, from 1949 to 1950 when we emerged victorious in the people's national liberation war and following the expansion of the liberated areas, we had to attend to the daily needs of several millions of captured personnel and also to the relief of unemployed workers and the poor and distressed masses in the cities and villages. Accompanying this, the financial expenditure of the people's government increased greatly while financial receipts could not catch up with the spending needs. It was then necessary to issue more money. Speculative elements then took advantage of the situation to pursue their speculative activities. Between June 1949 and February 1950 there occurred four big upheavals in commodity prices. In 1949 commodity prices went up 19 times while in the first 3 months of 1950 commodity prices were again doubled compared with the end of 1949. At the time, the masses eagerly hoped that the government would stop the runaway inflation and stabilize commodity prices while the imperialist elements furiously predicted that although the newborn red regime could demonstrate its ability in the military and political fields, it could hardly overcome its economic and financial difficulties. At the time, the people of the country were imbued with the fearless spirit of continuing to live, and to live better than before, without seeking aid from the imperialists. Placing implicit reliance on the regime of the people's democratic dictatorship and on the socialist economy, in March 1950 they proceeded with the work of unifying the country's finance and economy. The country's fiscal receipts were readjusted and consolidated. Fiscal expenditures were reduced to the minimum and a balanced budget was nearly achieved. Inflation was stopped. At the same time, all speculative elements bent on raising the commodity prices were sternly dealt with. Stability of commodity prices was attained. The government was thus accorded with the utmost esteem and support of the masses. All these laid the groundwork for the ultimate restoration and development of the national economy.

From the curbing of inflation during 1950 and up to the period of the first 5-year plan, the country continued to adopt the policy calling for a balanced budget which would also yield a small surplus. Subsequently, under the condition of rather large increases in fiscal outlays on account of the "war to aid Korea and resist America," we still followed the usual practice of increasing revenue receipts and reducing expenditures, to achieve the purpose of simultaneously resisting, stabilizing and building. By the time of the commencement of the economic construction period under the first 5-year plan, we had, on the one hand, to ensure and provide the necessary funds for economic developemnt and, on the other, to strive for the maintenance of a balanced budget. Despite the appearance of sundry difficulties on the way, they were all readily overcome. Comrade Chen Yun had cautioned that planning targets must be realistic, that the scale of construction work must suit the nation's capability, that the people's livelihood and national construction must both be cared for and that when making plans due provision must be made for the availability of material resources, funds, credits and loans. It appeared that the experiences gained from practice during this period exactly accorded with Comrade Chen's words. During this period, the economic development was rather rapid, the economic effect was relatively good, the market was prosperous, monetary circulation was normal, and there was assurance of the stability of commodity prices and improvement of the people's standard of living. Facts have thus shown that under our socialist system there does not exist the objective necessity of a budget deficit and of inflation of the demand-invoking nature. This precisely illustrates the superiority of the socialist economic system over the capitalist economic system.

Regrettably, after 1958, under the influence of the desire to achieve quick results, the positive role of subjective activity was over-emphasized and in the course of the "great leap forward" and the movement to set up rural people's communes, there came into force high targets, blind commands and a proneness to boasting and exaggeration. There also blew the so-called vicious "communist wind." The scale of capital construction was made unduly large, its battlefront was much too long and capital construction outlays made up some 56 percent of total budgetary outlays. On the surface, fiscal receipts appeared to have increased quickly, but in reality, at that time much "blind" production work was in progress and purchases were made blindly of large quantities of substandard products and products that had been stockpiled. The enterprises made use of bank loans to pay taxes and earn profits and in this way the inflation of bank credit actually worked its way to become false financial receipts. Financially, a balanced budget was never reached and in reality there were debits in the government accounts. As a result, there was a large issuance of currency. In 1957, the proportion of currency in circulation to the volume in sales of consumer goods was 1:9.5. By 1961, the ratio had gone down sharply. Due to the stringent supply of consumer goods, market commodity prices and particularly prices in country fair trade went up steeply, with the result that large numbers of urban and rural residents withdrew their bank deposits to make immediate purchases of goods. From this historical experience, we may find that the display of the superiority of the socialist economic system actually depends on people's actions being in compliance with the objective laws. Otherwise it is possible that errors in work will bring about fiscal deficits and inflation of the demand-invoking type.

Generally speaking, the fiscal deficits and inflation over the past 2 years in our country were brought about by certain problems in our work. These problems are of a long-standing nature and may be ascribed to three different reasons. First, the desire for quick results and failure to act according to one's capability were the ideological causes which brought about financial deficits. Under the guidance of "leftist" thought over many years and paying little or no attention to our country's basic national condition and national power, we have allowed the capital construction front to become unduly stretched and the projects excessively large. In order to maintain the scale of capital construction which obviously was beyond our capability we had to resort to such measures as doing away with consumption sinking funds, withholding agricultural investments and investments in light industry, putting aside public utility construction and residential building in the cities and towns, and even edging out such items as science and education. In the first 2 years following the smashing of the "gang of four," the desire to achieve quick results continued to play havoc. Certain excessively high and even impractical slogans and targets were put forth and the scale of capital construction which had already exceeded the nation's capability was made even bigger. The 3rd plenary session of the 11th Central Committee of the Chinese Communist Party then put a stop to these "leftist" errors. Proceeding from reality, a fundamental change was made. After the plenary session, the guideline of readjusting, restructuring, consolidating and improving was adopted. It was clearly understood that readjusting represented the major task concerning the national economy at the time and there was also a general understanding of the possible dangers of striving for quick results. Unfortunately this deep-rooted ideology of seeking quick results could not be rectified overnight. Besides, it has been necessary to "repay" the past debts accumulated on account of the anxiety for quick results. Despite the rise in the consumption level of urban and rural residents, the scale of capital construction could not be completely reduced at once. This made the appearance of fiscal deficits unavoidable.

Second, the dispersion and disintegration of financial power and the inability to have the fund sources concentrated also form a basic cause for the occurrence of fiscal deficits. This problem of the diversion of financial power appeared early in 1958. Through the 10 years of the "great cultural revolution" it was indeed very much in evidence. At the time emphasis was laid on the "self-raising" of capital construction funds. It soon developed that whereas funds and material resources were originally available for undertaking only one construction operation, frequently arrangements were made for two or three operations. This method of "making provision for gaps" unnecessarily lengthened the capital construction front. Also, it encouraged the further diversion of funds and even led to irregularities in the absorption of funds or raising of funds for the required purposes. Such phenomena as the daily increasing amount of funds outside the state budget, the daily increasing number of fund channels, the diverse spending of funds and the lack of an overall balance have long constituted problems requiring study and solution. In the financial administration over the past 2 years and following the reform of the financial structure, the financial power of the localities, enterprises and individual business units was enlarged. Their mobile financial resources were increased and their positivism was aroused. This certainly achieved some results insofar as microeconomics and enlivening were concerned. Nevertheless, this has further stepped up the dispersion and decentralization of the financial power. The amount of funds outside the state budget amounted roughly to 40 percent of the funds inside the budget. This meant a stringent financial situation for the central government in contrast with the relative affluence on the part of the localities, enterprises and individual business units. It has thus become impossible to concentrate power to wage a war of annihilation on deficits and the difficulties of curbing fiscal deficits have inevitably increased.

Third, the symptoms of the economic malady of the heavily restricted sphere of operation of state finance were also shown in the imbalanced economic development, low overall production power, poor economic effect from investments, and the slow increase or growth of sources of financial receipts. During the first 5-year plan period, every 100 yuan of fund accumulation could create some 35 yuan of national income. It could yield only 8 yuan during the 10 years of the "great cultural revolution" when enterprise management was in disorder, economic effect was on the downturn and losses were incurred by many enterprises which previously had reported profits. The full utilization of the productive power of the industrial and mining enterprises was curbed and this was accompanied and evidenced by such problems as large input of funds for economic construction but little return, inadequate use of funds and inability to provide the necessary accessory equipment for construction projects, resulting in a failure to achieve overall productive power. The last was particularly in evidence in the case of the coal, crude oil and electric power industries which literally became "bottlenecks" for economic development. Following the smashing of the "gang of four," the situation improved slightly. Unfortunately, these maladies in economic development were of long standing. It was obviously impossible to achieve improvement or a reversal all at once. This thus effectively curbed the growth in financial receipts of the state and it became really difficult to meet the demands, coming from all sides, for increased outlays.

The above analysis shows that the fiscal deficit and inflation of the demand-invoking type in our country was the outcome of errors in work but that such errors were relatively long-standing ones. If observation were confined to the fiscal receipts and disbursements of any one single fiscal year alone, a correct conclusion could not have been attained.

The Superiority of Our Socialist System Can Effectively Deter the Growth of Inflation of the Demand-Invoking Type

The attitude we have adopted toward inflation has been radically different from that adopted by the capitalist countries. Capitalist states take inflation as a common occurrence. The promises made by government leaders in election campaigns to curb inflation were frequently unfulfilled. On the contrary, in our country fiscal deficit and the resulting increase in the volume of currency in circulation are treated as hidden dangers and the principal tasks in the readjustment of the national economy have been designated as the accomplishment of a balanced budget, equilibrium in the receipts and payments of loan and credits and curbing inflation.

At the present moment, whether or not our country can effectively curb inflation is being closely watched by all quarters concerned. On our part, we have the utmost confidence. This is because the reason why we can stop inflation while the capitalist states cannot is not simply due to the ability of our finance departments to make suitable arrangements as to the fiscal receipts and disbursements or of our currency control department to effect strict control of the volume of money in circulation but rather due to the existence of much more serious causes. The inflation in our country did not come with the socialist system but was brought about by errors in work. It follows that after we have fully liquidated the "leftist" errors of long standing in our economic work and set a guiding theory of doing only what we are capable of and proceeding strictly according to priority order in economic construction, we can then take measures for thoroughgoing reform and can by means of a series of correct measures and policies fully implement the economic readjustment work. We can thus rectify past errors and rid ourselves of the long-standing abuse of striving for quick results.

In fact, we have had successful experiences in eradicating fiscal deficits and curbing inflation. In 1950, in unifying the financial and economic work of the nation, the whole party was mobilized, the entire country was of one mind, thought was unified, and, taking the interests of everyone into account, we soon stopped the vicious inflation which was the legacy from the old social order. In 1962, we carried out in depth the guideline of readjusting, consolidating, renovating and improving. The nation's financial power was centralized. Receipts were increased and expenditure was reduced. The capital construction frontline was shortened, while economy was also effected in administrative expenses and in expenditures for the enterprises. Special funds in the custody of different departments and units were frozen and liquidated. Credits and loans were put under rigid control and cash control was strictly implemented. In addition, other effective measures were taken to enforce the return flow or withdrawal of currency from circulation. As a result of all these measures taken, a balanced budget was achieved in 1962 and there was no need for additional currency flotation. Experiences have thus proved that strengthening the state's centralized and unified leadership does play a decisive role in eradicating a budget deficit and bringing about a balance of financial receipts and disbursements. In promulgating, early this year, the "decision on balancing fiscal receipts and disbursements and strictly implementing fiscal control," the State Council clearly pointed out: "We must implement the principle of centralization and unification in the distribution and use of financial power and strictly enforce fiscal control and discipline in matters of finance and economics."

In the current economic structure, both financial authority and financial power are, relatively speaking, decentralized and dispersed. This all the more requires the strengthening of planning and guidance from macroeconomics, the setting up of a comprehensive financial plan and achieving a proper overall balance. In strengthening the planning and guidance from macroeconomics, we must not only arrange well the disposition of funds within the state budget, but in regard to funds outside the state budget, loan and credit funds, sinking funds in the custody of the enterprises and foreign loans, we must likewise make overall plans and take all factors into consideration. Comprehensive arrangements must be made to attract and absorb all diverted funds for use by the state on urgent production and construction purposes and all useless and duplicated construction must be effectively avoided.

As for big and important problems with a bearing on the situation as a whole such as the scale of capital construction, the direction of investments, the taxation system and important financial policies and measures, they must be put under centralized and unified control and their handling must not be diversified. At the same time, in regard to the reform of the structure, we must learn how to combine the elasticity of microeconomic policymaking with the unified nature of macroeconomic adjusting. We believe that if only we can truly have our strength centralized we can completely overcome the hidden dangers in our economy.

In eradicating fiscal deficits, the measures taken must be short-term ones as well as long-term ones. The current measures taken to shorten the capital construction investment front and to reduce the expenditure on national defense, government administration and various types of enterprises all belong to the category of measures of economy and are all short-term measures. But, from the long-term view, we must still base our development on opening up new sources and on other long-term measures. At present, there is only little room for us to financially maneuver in, due basically to the limited state of our economic development and to the small size of our national income. However, we must also realize that, at present, the material foundation for overcoming our drawbacks has become vastly stronger than before. In 1980, the fixed assets of the 370,000 industrial enterprise units in the country, calculated according to their original prices, have increased by over 26 times compared with 1952 and these constitute an independent and relatively complete industrial structure and component of the national economy and are thus, a valuable base. Following some 30 years of construction and with the industries and other departments of our country having already built a rather firm foundation, the former situation of emphasizing capital construction and neglecting construction and of stressing expanded reproduction by extension and neglecting expanded reproduction by intension has been basically changed. Emphasis is now laid on tapping the hidden potentials of the enterprises, on lowering the consumption of materials, on improving the quality of the products, on raising the efficiency rate and finally on transplanting the experiences in management and technology of advanced localities and advanced enterprises to other localities in order to change the high disparity rate in the economic effect between localities and between enterprises. Quite obviously, the current financial position could be vastly improved, if we could bring about one of the following objectives: that for every 100 yuan worth of fixed assets, the localities could yield an amount of taxes and profits equal to 50 percent of the yield in Shanghai; or that the yield of taxes and profits from every 100 yuan of output value could be increased from the present approximate 26 yuan now to 34 yuan, a level achieved in the first 5-year plan and in 1965; or to reduce by one-half the volume of overstocked and stockpiled goods in the industrial, transportation, commercial and material resources departments. At present, we are grasping the production of consumer goods and the readjusting of the economic structure, the production structure and the structure of the products. These efforts all embody great significance in regard to the rationally proportionate development of the economy, the addition of commodity supplies to the market and the opening up of new financial sources for the state. This will help us basically to remove ourselves from a state of passivity, to strengthen our economic potential and on the basis of economic development, to widen the stage for our financial maneuvers.

In short, our present state of having a fiscal deficit and inflation can be overcome but the procedure will require some time and cannot be accomplished overnight. The reduction of expenditure can bring quick results but to provide a more spacious stage for our financial and economic maneuvers will have to wait for the healthy development of the entire national economy and the rationalization of the economic structure, the production structure and the structure of the products. We shall strive to cut short the time required for the consummation of these objectives.

RECENT DEVELOPMENTS IN PRC COMPUTER INDUSTRY OUTLINED

Beijing Computer Exhibition

Beijing GUANGMING RIBAO in Chinese 2 Sep 81 p 1

[Article by Zou Anshou [6760 1344 1108]: "Our Nation's Computer Industry Realizes New Progress"]

[Text] This reporter learned from the domestically manufactured computer products exhibition which opened yesterday in Beijing that our nation's new computer industry has made new progress. In recent years, the quality of products, the systematization and software and technical services have all visibly improved, the ratio between performance and price has improved, and computer applications have also produced preliminary results.

Our nation developed her first computer in 1958. Over the past 23 years, the efforts have developed into a fledgeling industry which includes scientific research and design, production and manufacturing and applications services. The whole nation has over 100 development and manufacturing units. In recent years, various models of series of machines have continued to develop. Greater improvements have been made in the stability of the products, systematization and producing sets of equipment, the ratio of performance to price and technical services. For example, the average operating time without downtime of the DJS130 small mainframe computer, which is the one widely used nationwide, has been increased from 50 hours in the past to over 1,000 hours. The systems capacity has increased from the past "three old components" (photoelectric input, punch card output, teletypewriter) as peripheral equipment to over 20 types at present. The systems software is gradually being perfected, the costs and prices have also dropped by a large scale. To strengthen technical service, last year, the nation established the China Computer Technical Service Company and the Series Computers Software Center. This year, branch companies have been established in related provinces and cities. Each production factory has also widely established applications service agencies, provided training for users, provided technical counseling, and equipment maintenance.

According to incomplete statistics, up to the end of 1980, the number of large, medium and small computers installed by every profession and trade throughout the nation had reached 3,000. These computers have served importantly in the development of our nation's science and technology, national defense construction and national economy. Since the beginning of this year, the computer industry has implemented the guideline of readjustment of the national economy, the emphasis of work turned from production and manufacturing to popularization and application. Some typical applications test point projects which are significant for popularization have been launched in the fields of energy, light textiles industry and transportation industry. Application of the computer in our nation has expanded from mainly for scientific and engineering computations and applications in the past towards data processing, business management and real time control in each of the departments of the national economy.

This computer exhibition and sales meeting sponsored by the National Computer Industry Bureau opened at the Beijing Exhibition Hall. Comrade Wang Zhen [3769 7201] officiated at the ribbon cutting ceremony. Over 200 products by more than 90 research and development units and production units throughout the nation participated in this exhibition. The exhibits were mainly applications oriented. At the same time, some new products were exhibited. According to user demands, technical lectures and technical exchange activities will also be held. The exhibit and sales activities will last for a month and a half and the exhibit will close on October 15.

Applications Stressed

Beijing GUANGMING RIBAO in Chinese 2 Sep 81 p 1

[Article by Staff Commentator: "Take Application As the Key to Exert Efforts in Developing Our Nation's Computer Industry"]

[Text] Popularization of the application of computer technology is a question that concerns the entire situation of developing our nation's computer industry. To solve this problem well will exert an important influence upon the development of the entire national economy, national defense construction and science and culture. At present, under readjustment of the national economy, the important question of developing our nation's computer industry should be to turn from the past practice of centering around the research, design and manufacture of computer hardware rapidly towards popularization and application as the key, and to use this to lead research and development, production and manufacturing, systematization of peripheral equipment, development of applications, technical service and sales of products.

Computer technology is a leading technology. The computer industry is a new industry that serves a leading function. It is an indispensable means of modernization for the technical improvement of the national economy and national defense construction and for the realization of scientific management. At present, the level of computer technology, the scale of production and the degree of application have become important signs of the development of modern productivity. It is a profession that has developed the fastest. It has also rapidly and widely penetrated each field and has brought about great changes in production, technology, management and even social life. Data shows that in modern industrially developed nations, there are over 4,000 professions that commonly utilize computer technology. Our nation is advancing towards the building of the four modernizations. If we do not realize computerization, modernization cannot be imagined. In national defense, whether for combat weapons, strategic equipment, or technical combat command and control, the computer is indispensable. In economic buildup, replacement of a massive amount of products must realize digitization, integration, intellectualization, and these all require the computer. The design, production, quality control, management reform of products all require the computer. The entire economic activity such as planning, statistics, comprehensive balancing, financial management, capital turnover are all inseparable from the computer. Therefore, in the period of readjustment of the national economy, each profession must emphasize the use of computer technology, select and use domestically produced computer systems and equipment as much as possible so that our nation's computer industry can develop quickly.

Research and development, manufacturing of products, applications services, training of personnel are the four important parts of the computer industry which cannot be separated from each other. Of these, popularization of application and technical service are a link that we have not paid much attention to in the past. We must fully recognize this point, and in readjusting the guiding ideology and industrial structure, there must be a strategic change.

According to our nation's actual situation, we should first pay attention to the popularization of small computer and microcomputer systems. Small computer and microcomputer systems are low priced, changes in the system are more versatile, they can better adapt to the changes in user demands by the users and maintenance personnel and technological developments. Therefore, they are an inexpensive technological means in the important path to realize automation in management and control. Therefore, while developing large and medium sized new series of computers, it seems very important to develop small computer and microcomputer systems that have a great demand and that have broad applications.

Emphasizing application as the key does not mean that systematization and systems functions can be neglected nor does it mean that product quality and reliability of the operating system can be neglected, nor does it mean that the ratio of performance to price can be neglected. It is exactly the opposite. To popularize application, we must tightly grasp the two weak links of software and peripheral equipment. We must develop applications software, develop a processing system for Chinese characters, continuously perfect and expand the function of the computer system, continuously improve the reliability and stability of the system. This is to establish the material foundation for application well. To improve the competitiveness of domestically produced computers and suit the level of the domestic users, it is very important to establish a policy to lower the price.

The goal of developing the computer industry is entirely for application. Only application can open up the way, and especially by strengthening technical services for the users can the sales of products be opened up. Sales is an important economic and technical activity of enterprises, it is the key upon which the life of the enterprise depends. Sales of computers and technical service are closely related. Foreign computer factories and businesses take "user service" as the most important guiding ideology of the entire business activity of the company. The best technical personnel are assigned to sales and technical services positions. Technical service personnel and product sales personnel constitute about one third of the entire personnel of the profession. Now, application of our nation's computers has gradually turned towards the various departments of the national economy. It has expanded from scientific computation to data processing and real time control. While the strength of computer technology of the various sectors of the national economy is still weak at present, the technical problems encountered in data processing and real time control are more complicated, strengthening technical service for the users is a forceful measure to open up new fields of application. We must allow about thrity percent of the technical force to carry out applications service. Research institutes, mainframe plants, peripheral equipment plants must all place applications service in an important position. We must also readjust some units that presently duplicate production to change them to units specializing in applications service according to plan. We should mobilize special technical personnel from more enterprises and research institutes towards applications service, establish regional and even national sales service networks. Each region should strive towards a three-in-one combination of research and development, production, technical service and market sales while establishing computer industry companies. We must open up a road for broad applications through technical service to lead research and development and production. Only in this way can there by vitality. The present stage of technical service cannot be too ambitious. We should start out from the easy and advance towards the difficult and from the typical to the universal. At present, we must grasp tightly the computer applications systems which are technically more mature, which require less investment, which can produce quick results, which are worth popularization in the fields of energy, light and textile industries, transportation and management so that visible economic gain can be obtained within a short period.

Popularization of the application of computers is a strong driving force in the development of computer technology and industrial development. As long as the leadership pays attention, grasps the situation tightly, the computer industry will surely enter a new stage of development under readjustment and will serve its function in the development of the national economy.

FINANCE AND BANKING

BRIEFS

JIANGSU FINANCE MEETING--The Jiangsu Provincial People's Government recently held a meeting of mayors and commissioners on the implementation of the economic responsibility system. The province will soon implement a new finance system that requires the various municipalities and countries to be responsible for their own surplus or deficits in financial revenues and to share with the province a certain portion of their surplus revenues. Provincial Governor Hui Yuyu presided over the meeting and made important speeches both at the beginning and end of the meeting. The new system is aimed at enlivening the economy and further arousing the enthusiasm of local enterprises to increase production. [OW141516 Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 12 Sep 81]

REVENUE INCREASE IN YUNNAN--With industrial and agricultural production developed and commodity circulation expanded, revenues increased and expenditure declined in Yunnan in the first half-year, laying a good groundwork for balance of revenue and expenditure, credit balance, and price stability. From January to June, provincial revenues fulfilled 55.5 percent of the annual target, a 3.4 percent increase compared with the same period of last year. The annual revenue targets were fulfilled ahead of schedule in Nujinag and Diqing prefectures and were fulfilled more than 80 percent in Dehong and Baoshan, more than 60 percent in Dongchuan, Yuxi, Enmao, Xishuangbanna, and Lincang prefectures, zhou, and municipalities, more than half of their targets in terms of timing and tasks. The targets of industrial and commercial tax collections were fulfilled 55.9 percent, a 14.1 percent increase and an additional revenue of 61 million over the same period of last year. Collection of tobacco, wine, and sugar taxes in the first half-year increased by 54 million yuan. Simultaneously with this, expenditures in the first half-year dropped 18.9 percent compared with the same period of last year. [Text] [Kunming YUNNAN RIBAO in Chinese 1 Aug 81 p 1] 9780

ENERGY

DRIVE TO DEVELOP METHANE FOR CITIES UNDERWAY

Beijing GUANGMING RIBAO in Chinese 2 Aug 81 p 2

[Article by Mao Rongfang [3029 2837 2455]]

[Text] Comrade Zhou Shi o [0719 1102 6166], head of the Thermodynamic Porcess Department, Nanjing Kinetics Training School, and Director of the Nanjing Municipal Boiler Institute, recently called on the authorities concerned about the prospect of developing methane for urban users. He is convinced the conditions are favorable for the cities to develop methane. Since there is a lot to gain, a project to develop methane for urban users looks very promising.

Inasmuch as the national economy and livelihood of the people depend on energy, the production of methane is in fact an integral part of the development of energy. Today, many communes and production brigades are already using methane even though it is not yet seriously considered for the cities. Zhou Shiwo believes the conditions are right for producing methane for urban users because it is done in many foreign countries and a few of our cities have experimented it on a limited scale. A city of several hundred thousand to a million people has plenty of night soil, waste from meat, tanning and bone glue factories as well as distiller's grains to generate methane. Take Nanjing for example. There are 1,800,000 residents, plus a sizable transient population. Suppose each kilogram of night soil generates 0.3 cubic meters of gas, the daily output of methane is about 500,000 cubic meters, equal to the caloric capacity of more than 500 tons of coal, enough to meet the need of 800,000 to 900,000 people. As for the structure of the facilities, large-size cement pits or daub-lined steel tanks are more suitable for centralized treatment of city sewage by specialists. The waste heat may be used for heating. As a matter of fact, fermentation may go on all year round to generate methane for all seasons. Moreover, instead of depending on natural fermentation as is done in the villages, fermentation agents may be used to speed up the fermentation cycles. The methane generated is cleansed in water and put through the city gas pipes. It is very simple and convenient. So we may say the development of methane for the cities is even more urgent than that for the villages. Since the conditions are so favorable, such a project should be entertained without hesitation.

Zhou Shiwo also named the advantages of developing methane for urban users. First of all, once the disease germs in the night soil are destroyed by fermentation, it will no longer spread diseases and breed parasites when it is used to fertilize crops and vegetables. Secondly, centralized treatment of city sewage reduces pollution of water sources by sewers. The city air will become clean again as its residents switch from coal stoves to methane burning ranges. Thirdly, to depend on gas alone is rather precarious as thousand of households may be affected once the supply is interrupted. With methane as an alternate source of gas, the city could be considered well prepared to face emergencies. Fourthly, the city residents will be delighted as the use of methane helps release a tremendous amount of labor otherwise tied down by the coal burning stoves.

ENERGY

DEVELOPMENT OF METHANE IN DONGHAI, JIANGSU RELIEVES FUEL SHORTAGES

Beijing GUANGMING RIBAO in Chinese 2 Aug 81 p 2

[Article by Yu Guan [6735 0385] and Zhang Yongqian [1728 3057 6197]]

[Text] Donghai County situated in the Xuhuai plain, is so poor a region that there is hardly any fertilizer for the fields, fodder for the cattle, nor straw for the commune members to burn as fuel. In late winter and early spring, some people have to burn dried potatoes as fuel. So the doggerel goes: "Food poses no problems, clothing poses no problems, but what has to burn under the cooking pot poses a real problem." The cadres are aware of the situation but could not do anything except to agonize about it. Everyone is anxious to find a solution to resolve the shortage of straw for fuel. However, in 1975, the xian began to produce methane. After a few years of endeavor, they have built some 33,000 methane-generating pits. Now methane is available to 20 percent of the production brigades and teams of the 4 communes. To the people of Donghai, "methane is such a treasure that you have to have it for both production and daily living."

We visited the homes at the Xiaodian production brigade of Qinghu Commune where each household has a three-in-one methane-generating pit. Even though every pit is connected to a toilet and a pigsty, the house is kept clean both inside and outside. When we entered a room where the stove is, we did not see any trace of black ashes and pollutants. This presents a picture completely different from those stove compartments where people burn straw and charcoal. The brigade cadre who accompanied us said: "In the past we had neither toilets for people nor sties for pigs. Every time it rained, the whole place overflowed with filth and sludge. As a result, flies, mosquitoes and germs multiplied and spread, causing such epidemic diseases as dysentery, malaria and enteritis, a real threat to human health. Now as we are on methane. What we do is simply to put all the night soil and garbage into the pit and let them ferment. This cuts down germs, insects and diseases. The use of methane is a real sanitary uplift for the villages." The use of methane also makes household chores much simpler for women who claim that cooking which used to be complicated has become much simpler. When you return home from work, what you do to cook is to turn the switch and light a match and that is all there is to it. It saves labor and time, and works wonders.

Lao Zhang, secretary of the Henggou commune party committee, said they empty their methane-generating pits both in the spring and fall. Each pit yields 20-30 cubic meters of fertilizer and the whole commune could stack up over 100,000 cubic meters of fertilizer per year. If we provide each mou of land with two cubic meters of this methane fertilizer, we could save 70,000 yuan otherwise spent to buy chemical fertilizers. Weed and night soil become potent fertilizers after fermentation in methane-generating pits. According to a comparative study of the strength of indigenous and methane fertilizers conducted by the county Agricultural Science Institute at the Tangfang production brigade, the nitrogen content per 100 jin of methane fertilizer is over 10 times more than that in a similar amount of indigenous fertilizers. Last year we planted 10 mou of peasants to test the relative potency of the indigenous and methane fertilizers. The part which had the methane fertilizer produced 454 jin of peanuts per mou, an increase of more than 50 percent over the part where indigenous fertilizer was used. Loa Zhang also explained to us the changes brought about by the use of methane. Five years ago, according to him, the commune was very poor. In the three years since the introduction of methane in 1978, it has produced 1.4 times more grains and edible oil and raised 1.6 times more pigs. The food ration of the commune members has increased over 200 percent. Being able now to surrender over 7,000,000 jin of grain to the state and save 15,000,000 jin of straw per annum, we have ended that difficult period of dependence on the state for money and grain and paying for straw and charcoal brought from other localities. The members of the commune have built over 2200 tile-roofed houses with the straw and money they saved. Other comrades of the country believe the changes taking place at the Henggou commune is representative of the situation in the entire Donghai county which has been saving 4-5 thousand tons of coal and close to 100,000,000 jin of straw each year since 1978.

The Chenzhan production brigade of the Hongshuang commune has 307 households of about 1300 people. Before the introduction of methane, 117.5 workers had to gather straw for fuel all year round. Now, the 34 children who used to gather straw are in the school. The trees in the villages "once stripped of their bark, cut back or uprooted" are blooming again in the spring as afforestation advances by leaps and bounds. In a stretch of 30 years after liberation, each person on the average had planted 213 trees. But each has already planted over 240 trees within one year after the introduction of methane. In other words, a 30-year job is done in one year. The Chengxi primary school of the commune used to spend 250 yuan per annum to provide its 13 teachers with 2-3 jin of kerosene each evening for lighting. The use of methane has solved the cooking and lighting problem of its two resident teachers and their five dependents. The money for kerosene they saved last year is enough to buy the school a blackboard, rulers and a terrestrial globe. Since the students do not have to drink boiled water any more, the number of sick leaves due to stomachache has dropped noticeably.

The heartening situation in the villages of Donghai xian and the pleasure its people derive from the use of methane have taught the cadres an inspiring lesson. They realize now the development of methane is a great popular endeavor which benefits the people and promotes agricultural development. It is a vital rural construction project designed to provide energy, fertilizer, environmental protection and public health. The people of Donghai County are confident that in 5 or more years they will develop this new enterprise well enough to make methane available to the entire county.

ENERGY

TAIYUAN GETTING READY FOR COAL GASIFICATION

Taiyuan SHANXI RIBAO in Chinese 14 Jun 81 p 1

[Text] The 6th plenum of the Shanxi Provincial People's Government which took place on 11 June to study coal gasification for Taiyuan was attended by all the members of the provincial government and the heads of its various commissions nad departments, plus the specialists and technical personnel invited to participate in the discussion. Chaired by Luo Guibo [5012 6311 3134], the governor, Yue Weifan [1471 4850 5672], the deputy governor, reported to the meeting on the progress of the coal gasification project for the city of Taiyuan. The meeting voiced its unanimous support of the coal gasification project for Taiyuan which it considers beneficial to the people and worthy of step-by-step implementation.

The engineering preparations for gasification in Taiyuan were set in motion by the Ministry of Coal Industry and the Shanxi Provincial People's Government which agreed in writing to operate jointly the Taiyuan Gas Company. With active assistance given by the provincial and city authorities concerned, the planning institute of the Ministry of Coal Industry now designated to draw up the gasification plan has been working to get it ready as soon as possible for submission to the provincial government and the Ministry of Coal Industry for approval. A preparatory sub-committee has been set up to lay the ground work for organizing a coal gasification company and erecting a 400,000-ton coking plant. The provincial Construction Commission has decided to ask the Chemical Industry Planning Institute and the 13th Metallurgical Construction Company to design and build the coking plant. The Municipal Planning Institute of Tianjin is authorized to design the gas pipe lines for the whole city as planned.

More than 1000 tons of equipment and over 7000 tons of refractory bricks for the 400,000-ton coking oven are already at the construction site. A plant leadership, including an administrative staff, the managing and deputy chief engineers, is taking shape while over 60 technical and business personnel are actually working at the plant site. Other staffers had gone to visit the major coking plants both within and outside the province to gather technical data required to prepare for the construction and operation of the plant in Taiyuan. Moreover, the construction of the project of the Taiyuan Detergent Plant to use cracked parafin gas to produce liquefied petroleum gas and that of the Taiyuan Chemical Fertilizer Plant to recover its coke oven gas is already in progress. Following Comrade Yue Weifan's report, Comrade Luo Guibo said: coal gasification is a good thing which the people of Taiyuan have been clamoring for all these years. We as workers of the people's government should do what is good for the people. We must see to it that the coal gasification project for Taiyuan is done properly and promptly. While those departments and units directly involved in the project must work hard, all other appropriate departments and units should also support it and cooperate actively. We welcome different views and recommendations, especially the opinions of our engineering and technical comrades. However, close cooperation and active support must be given to what has been decided to be done so as to speed up the preparatory work of the Taiyuan coal gasification project. Comrade Luo Guibo also told the provincial Department of Chemical Industry and other related departments to watch the progress and quality of the project of Taiyuan Chemical Fertilizer Plant to recover its coke oven gas and that of the Taiyuan Detergent Plant to utilize cracked parafin gas. He also asked the appropriate provincial and city authorities to do well the production and supply of better honeycomb briquets at a lower cost.

SHANGHAI'S INDUSTRIAL SYSTEM UNDERGOES MAJOR CHANGES

Shanghai WENHUI BAO in Chinese 3 Aug 81 p 1

[Staff correspondent: "Shanghai's Industrial System Undergoes Six Major Changes"]

[Text] Comrades in the municipal industrial system, who studied the documents of the Sixth Plenum, looked back on the profound changes that have taken place since the Third Plenum after the industrial system implemented the policy of economic readjustment. These changes have illustrated that the line and general and specific policies laid down at the Third Plenum are entirely correct.

In their opinion, six major changes have taken place in the industrial system:

First, industrial structure is developing in the direction of light industries. With various units in the industrial system exerting efforts to organize production according to market requirements at home and abroad, the industrial structure has undergone new changes. Light industrial output (including textile, handicraft, and electronic products for daily use) increased 22.6 percent in 1980 compared with 1978, and 6.2 percent in the first half-year compared with the same period of last year. The proportion of light industrial output in the total value of Shanghai's industrial output was up from 49.3 percent in 1978 to 54.8 percent in the first half of this year.

Second, the product structure has undergone changes. Over the past two years, 302 kinds of products from the municipality have been rated fine-quality products at the municipal level, of which sixty-five have won gold and silver medals from the state; 270 kinds of products have been rated first place among similar products nationwide. The variety of new designs, sizes, colors has continued to increase. Over the past two years, the bureaus of textile, light industry and handicraft industry have trial-produced more than 60,000 items of new designs and colors, averaging a 23.5 percent increase a year, of which more than 70 percent have been put into the batch process. In the first half this year, 12,000 kinds of new designs and colors have been successfully trial-produced and more than 85 percent have gone through the batch process.

Third, fast growth in market supply of consumer goods, particularly in the case of high- and medium-quality products and durable consumer products. Among light industrial products, between 1978 and 1980 foodstuffs and cigarettes increased at an average progressive rate of 8.4 percent a year, clothing products at an average progressive rate of 13.2 percent, and products for daily use an average progressive rate of 12.4 percent. Over the past two years, the main items of durable consumer goods showed greater rates of progressive increase a year: 130 percent for tape-recorders, 61.3 percent for TV sets, 40.6 percent for electric fans, 39.9 percent for cameras, 15.4 percent for watches, 12.4 percent for transistor radios, 8.7 percent for bicycles, and 8.3 percent for sewing machines.

Fourth, development of export products. More than 2,000 enterprises are turning out export products with sales reaching more than 150 countries and regions. The structure of export products has also undergone changes with the output of export products of the metallurgical, chemical and first machine-building bureaus and the instrument and meter bureau No 4 showing an average progressive increase of 39.9 percent a year between 1978 and 1980.

Fifth, the economic system preliminary restructured. Since 1979 when the system of retaining a portion of profits was tried out, two industrial bureaus, twenty-nine companies and forty-one plants have tried out expansion of powers for stimulating the enthusiasm of cadres and the masses for acting according to the economic laws. In the case of all the experimental enterprises, total output value and profits in 1980 increased about 7.5 percent over the previous year, higher than the average municipal level. A group of enterprises in the municipality have broken down the ownership barriers of districts, trades, and departments and developed more than 300 forms of economic combinations, promoting the development of production.

Sixth, rise in industrial production level. Shanghai's gross industrial output in 1979-1980 increased at a progressive rate of 7.2 percent a year compared with 1978. In the first half of this year, despite that the number of working days was one day less than in the same period of last year, average daily output still increased 0.4 percent.

Comrades in Shanghai's industrial system have benefited from implementing the economic readjustment policy. Many comrades have said that the tasks of readjustment are still heavy and formidable and that some contradictions remain to be resolved. They have determination to implement the decision of the Sixth Plenum of the party and see to it that Shanghai, an old industrial base will contribute more to the state in the course of readjustment.

BUSINESS MANAGEMENT REFORM IN WUHAN

Wuhan HUBEI RIBAO in Chinese 1 Aug 81 p 1

[Article by Wang Changxiao [3769 7022 1321]: "Underwriting Profits, Sharing Additional Income" Practiced by Eight Industrial Bureaus"]

[Text] The Wuhan municipal people's government recently announced measures for "underwriting profits and sharing additional income" to be practiced by the eight municipal bureaus of textile, first light, second light, machine-building, metallurgical, building materials, chemical, and electronics industries. This marks a new advance for the economic responsibility system on the Wuhan industrial front.

"Underwrite profits and share additional income" is an effective policy measure taken after experience had been gained by the municipal bureau of metallurgical industry in trying out the system of "underwriting profits and sharing additional income industry-wide." When the municipal authorities first transmitted from the higher authorities to the bureau of metallurgical industry a 9 million yuan target of profits to be delivered, the bureau was not prepared to accept the task. After consultations, the municipal authorities changed the target into one of underwriting 9 million yuan in profits and sharing additional income at an 8:2 ratio. Eventually, the target was fulfilled with the following results: Last year the bureau delivered 9 million yuan in profits to the state; with their income increased by 310,000 yuan the bureau retained 1.11 million yuan according to the terms agreed upon. Thus, each side benefited. This inspired and encouraged the municipal government. Convinced of the effect of the economic responsibility system the municipal government decided to introduce the system on a broader scale this year.

In the course of practicing this economic responsibility system - "underwrite profits and share additional income" - the municipal government held repeated consultations with the departments and bureaus concerned and then decided to proceed from reality and determine a rational base of underwriting profits and the proportions of profits to be shared, taking into account the production-increase potential of each industry and how difficult or easy it is for each industry to increase its profits. For example, in the case of the bureau of textile industry, the amount of profits underwritten was 208 million yuan and the additional profits to be shared by the bureau and the finance department at the following ratios: 1:9 for profits over 190 million, 2:8 for profits over 208 million, and 9:1 for profits over 237 million. In the case of the bureaus of the first light, second light, and machine-building industries, the amount of profits over the underwriting target was to be shared between the bureaus and the finance department at the ratio of 2:8. In the case of the bureaus of chemical, metallurgical, and electronics industries, the amount of profits additional to the underwriting targets was to be shared at a 8:2 ratio between the bureaus and the finance department. In the case of building materials industry, the amount of profits over the underwriting target was to be shared between the bureau and the finance department at a 6:4 ratio.

Before the eight industrial bureaus implemented "underwrite profits and share additional income," a 15 million yuan gap in the 362.31 million target of profit delivery to the state had remained unfilled by Wuhan's industrial enterprises this year. After the bureaus implemented "underwrite profits and share additional income," not only could the 15 million yuan gap be filled, but also the annual targets of industrial profits to be delivered to the state are expected to be overfulfilled. The responsible persons of these bureaus have expressed determination to assume the economic responsibility, share the state's cares and burdens and contribute more to the state. They are making each level underwrite profits to be delivered. Municipal Financial Director Xu Nongye [1776 6593 0048] said with deep feeling: "When trying to fulfill the annual financial plans in the past, we were gliding on a piece of melon skin, not knowing where we were going, and we worried about things all the year round. The present system of 'underwriting profits and sharing additional income' combines power, responsibility, and profit. Production can be developed and state revenue is assured. The big stone on our back for six months is now laid on the ground."

In addition to the eight municipal industrial bureaus, the Bureau of Public Utilities, the Bureau of Building Construction, the Bureau of First Commerce, the bureau of second commerce, and the supply-marketing cooperatives also announced the implementation of the "underwrite profits and share additional income" system. The municipal authorities have decided to adopt the economic measures, "quota subsidy, no subsidy for above-norm loss, and retention of surplus for own use."

ABOVE-QUOTA PIECEWORK BONUSES INTRODUCED IN SHANGHAI

Shanghai WENHUI BAO in Chinese 29 Jul 81 p 1

[Staff correspondent: "Above-Quota Piecework Bonus Offered by Shanghai Industrial Enterprises"]

[Text] An above-quota piecework bonus system on a plant-wide or industry-wide basis is now being practiced among more than 300 industrial enterprises and 200,000 workers in Shanghai municipality for satisfactorily linking the results of enterprise operations to the material interests of the workers and for stimulating increased production of many commodities that are in short supply on the market.

This system of reward was first tried out by the hardware company under the Bureau of Handicraft Industry. Early in 1979, products from the Huasheng Electric Fan Factory, the Shanghai Shoe-nail Factory, the Shanghai Aluminum Products Factory No 2, and the Shanghai Masthead Light Factory under this company fell short of demand and the company ran into many difficulties in increasing their output. To stimulate the enthusiasm of the enterprises and their workers, the bureau and the company worked out annual output targets for the four factories, stipulating that, provided they fulfilled their quality and profit targets and goods supply contracts, they may get above-quota piecework bonuses if they have exceeded their annual output targets. The result was that the products turned out by the four factories - showed greater increases during the year with output value up 10.8 percent and profits up 11.6 percent compared with the previous year. Originally, it was calculated that no one would get a bonus, but the result was that workers got an average bonus of 131 yuan.

Since this method of bonuses is satisfactorily stimulating the enthusiasm of enterprises and workers, those industries and enterprises producing bicycles, sewing machines, watches, cold drinks, cigarettes, beer, glass frames, transistor radios, TV sets, tape-recorders, electric meters, clothing, furniture, leather shoes, electric irons, and locks have practiced this bonus system this year. The municipal bureau of light industry has agreed with the bicycle company to take last year's output of 3,760,000 bicycles as the base for the current year. They have agreed that no bonus will be applicable to this output figure and that for each bicycle produced over and above this figure a bonus of 10 yuan will be given. Calculated on this basis, an average bonus of 170 yuan could be earned by each worker if the current year's output reached the target of 4.1 million bicycles.

BRIEFS

ANHUI ELECTRONICS INDUSTRY--Hefei, 15 Sep (XINHUA)--As of the end of August, the electronics enterprises in Hefei, Anhui, had produced 130 million yuan of electronic products. Thanks to renovation of equipment and tapping production potentials, the electronics enterprises in Hefei produced 268,000 radio sets during the first 8 months of this year, topping the same period of last year by 120 percent. [OW151217 Beijing XINHUA Domestic Service in Chinese 0105 GMT 15 Sep 81]

FUJIAN INDUSTRIAL ENTERPRISE MEETING--Speaking at the Fujian Provincial Industry and Transport Work Conference on 15 September, Vice Governor Wang Yan noted that 1,008 state-owned enterprises at and above county levels in the province are implementing the system of shared responsibility in loss and profit with good results. This system will be propagated throughout the province next year. Comrade Wang Yan stressed that in implementing this system, industrial enterprises should handle well the relationships between the enterprises and the state and between the enterprises and individual workers. No enterprise is allowed to go after profits to the neglect of state plans. He also urged better ideological and political work and supervision of enterprises' economic activities. [OW180529 Fuzhou Fujian Provincial Service in Mandarin 1120 GMT 15 Sep 81]

JIANGSU INDUSTRIAL PRODUCTION--The Jiangsu Provincial Economic Commission recently held a meeting of directors of prefectural and municipal economic commissions and responsible persons of provincial departments and bureaus concerned. The meeting stressed that industrial enterprises should strive to produce more salable goods and fulfill state plans during the next 4 months of this year. It noted that Jiangsu's industrial production of the first 8 months had been increasing steadily, with total output value topping the same period last year by 5.4 percent. However, many products were in short supply, quality of some products was declining while others were unsalable because of unattractive designs. All this should be avoided in the next 4 months. The province can expect to achieve the annual industrial growth rate of 6 percent set forth by the provincial people's government. It is even possible to reach the 7-percent mark with arduous efforts. [OW180543 Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 17 Sep 81]

DOMESTIC TRADE

BRISK RURAL URBAN MARKETS REPORTED IN JIANGSU

Rural Market Thriving

Nanjing XINHUA RIBAO in Chinese 4 Aug 81 p 1

[Article by correspondent Shen Gongxiao [3088 0364 5135]: "New Spectacle of 'Three Increases and One Reduction' in Rural Market of Our Province; To Ensure Greater Prosperity for the Rural Market, Action Is Being Taken To Tighten Control on Business Activities and Negotiated Transactions"]

[Text] Since the Third Plenary Session of the 11th Party Central Committee, our province has witnessed a thriving market in the countryside, characterized by the "three increases and one reduction." Such prosperity has been a rare sight for more than 20 years.

Increased Forms of Economic Structure Break the Monopoly of Supply and Marketing Cooperatives.

Business in the rural areas of the province has now returned to the days of the 1950's, when the coexistence has now returned forms of economic structure was permitted. In addition to the supply and marketing cooperatives owned by the whole people, there are also cooperative stores owned by collectives, itinerant peddlers, restaurants, service centers and repair shops run by communes and production brigades or teams, and integrated enterprises of farming, industry, and commerce. By the end of June 1981, according to incomplete statistics, there were more than 25,000 collective commercial undertakings in the countryside, which was close to the figure in 1965, before the "Great Cultural Revolution." The number of personnel exceeded 145,000, or 2.2 times that in 1965. These different forms of economic structure are mutually supplementary and contribute to the prosperity of the rural market. In the first half of 1981, the total output value of agricultural and sideline products by the supply and marketing system of the province totaled some 420 million yuan. If the reduced yield of cotton is excluded, this represents an increase of approximately 5 percent over the same period in the previous year. The sale of capital goods totaled more than 1 billion yuan, an increase of 8.4 percent over the same period last year, while the sale of consumer goods totaled some 2.2 billion yuan, an increase of 3.3 percent over the same period last year.

Increased Channels Further Promote Circulation of Material.

Since 1979, state planning supplemented by market regulation in the countryside has replaced the former system of excessively rigid control, which practically blocked the channels of circulation. For agricultural and sideline products of the third category and for portions of those of the first and second categories remaining after procurement, negotiated purchases and negotiated sales are being practiced in the province. The supply and marketing system has also set up 83 trade warehouses at or above the county level and more than 2,400 country trade fairs. Transactions last year at country trade fairs alone totaled more than 1.576 billion yuan, equivalent to approximately 10 percent of total retail sales. The increase in transactions is even larger this year. With the increase in the channels of circulation, the sales and purchases of agricultural and sideline products have been brisk, and some native special products, dried and fresh fruits, aquatic products (fresh or still alive), traditional snacks, and dumplings have returned to the market after a long absence. Sales of industrial goods have also increased gradually, and the phenomenon of overstocking in one place and running out in another has been basically changed. Last year, people in Xuzhou Prefecture had a lot of leftover reeds and starch and did not know how to dispose of them. The trade warehouses came to their assistance, and whatever they had on hand was completely sold.

Increased Flexible Forms of Business Mean Greater Convenience to the Peasants.

In the past, commercial departments in the countryside has the bureaucratic style of sitting in the office to wait for customers. Now there are many more forms of business transactions, such as exchange meetings, supply meetings, exhibition and sales meetings, service departments in the early morning and late evening, roadside stalls, deliveries to villages and fields, and so forth, with greater flexibility and improved service. Some traditional features of trading have also been restored. Last May, the supply and marketing cooperative of Huaian County held traditional temple fairs--a relic of the days of sedans and coaches--along with 20 material-exchange meetings participated in by communes and basic-level units. In Huaian County, the Nanping Supply and Marketing Cooperative recently made 103 deliveries to the countryside, and in the first 20 days of June nearly 10,000 yuan worth of goods were delivered. In the first half of 1981, Suzhou Municiplaity and Wuxian County jointly held 11 exchange meetings for supplying industrial goods to the countryside, and the transactions totaled more than 3.21 million yuan. After a long absence, hawkers shouting their wares are being seen once again in the villages.

Reduced Intermediate Links in Circulation of Goods in the Rural Market.

Because of self-imposed restrictions, the circulation of goods was formerly organized strictly according to the demarcation of administrative districts. This resulted in many intermediate links and regional barriers. Now these barriers have been removed, and circulation is organized according to the demarcation of economic zones. Procurement and marketing beyond district limits are now permitted, and production and sales are gradually coming face to face. For example, fruits in our province (mainly apples and dates in the hot season) totaling approximately 2 million dan each year were procured by the local supply and marketing departments, and there were three or four intermediate links between production and consumption. The producing units did not get much benefit, supply and marketing departments lost approximately 2 million yuan each year, and consumers could hardly ever eat any fresh fruit. Thus the producers, suppliers, and consumers all had complaints. After the combination of planned delivery with negotiated purchases and sales, the supply and marketing departments throughout the province procured only some 300,000 dan, approximately 16 percent of the total yield, leaving all the rest to be sold by the producing units in the open market. Thus the producing units are making more money, the supply and marketing departments have reduced their losses, and consumers can eat fruits while they are still fresh. All three parties are now happy.

While bringing vitality to the rural market, the "three increases and one reduction" have also created certain new problems. For example, following the policy of coexistence of different forms of economic structure, a bull market has appeared and some departments that should not be involved in commercial activities are now dealing in agricultural and sideline products and industrial goods, thus upsetting the state's procurement and marketing plans. In some localities, the practice of negotiated purchases and negotiated sales has gotten out of hand and is creating conditions for speculation and profiteering. All of these activities have affected market supply and price stability. These problems have attracted the attention of the authorities in various localities, and the industrial and commercial administrative departments at various levels in the province are now tightening their control with the assurance that "control will not be overly rigid, and relaxation of control will not produce disorder" in the rural market.

Statistics for 6 Months

Nanjing XINHUA RIBAO in Chinese 28 Jul 81 p 1

[Article by Information Section of Jiangsu Statistics Bureau: "Thriving Market in Cities and Countryside, Following Increased Domestic and Foreign Trade in Jiangsu During First Half of 1981"]

[Text] The first half of 1981 has witnessed an increase in domestic and foreign trade in our province. The market in cities and the countryside is thriving, and the people's level of consumption has been raised.

Since the beginning of this year, further implementation of the party's rural policies has brought about a rapid development of the rural economy. Industrial departments have continued to increase the supply of consumer goods according to the readjustment policy, thereby providing a strong material foundation for the commercial departments to increase the procurement of agricultural and industrial products and to keep the market well supplied. In the first 6 months, the total value of procurement by state-run commercial enterprises was 7.2 percent more than in the same period last year. This included a 26.6-percent increase for agricultural and sideline products and a fourfold increase for grain and edible oils. Such a wide margin of increase has been very rare in recent years. The value of procured industrial goods was 2.4 percent over that of the same period last year. The special feature of the market is the large increase in supply to meet the growing demand. The volume of procurement of wristwatches, bicycles, sewing machines, TV sets, and radios increased by 60 percent over the same period last year. There is, however, a drop in the procurement of goods in excessive supply, including metals and chemical-industry commodities. In the first 6 months, commodities procured for foreign trade increased by 16.8 percent over the same period last year. This was a strong support for the export trade. The total value of exports in the first 6 months increased by 26 percent over the same period last year.

By the end of June, the total value of goods in stock had increased by 10 percent over the same period of last year. Those of the train and foreign trade departments had increased by 49 and 29 percent, respectively.

In the first 6 months of this year, per capita consumption in the province was 5.4 percent higher than the same period last year, if the price factor is not taken into account.

In the same 6 months, the market was brisk in the cities and in the countryside. The volume of retail sales was 4 percent higher than in the same period last year. This included a 10-percent increase of consumer goods in the cities. Although there was a reduction in grain output in the countryside at or below county level in some prefectures last year, the peasants' income was not affected, thanks to the rapid development of sideline production and commune- and brigade-run industries. The volume of retail sales was still 3.8 percent higher than in the same period last year. Retail sales of consumer goods were quite good, as shown by the large increase of food, clothing, and high- and medium-grade goods. Sales of ordinary daily necessities also increased. by 26 percent over the same period of last year, while grain, edible oils, pork, poultry, fresh eggs, cigarettes, and liquor increased within the range of 2-8 percent. Of the 11 main types of commodities used for clothing, 10 of them showed increased sales over the same period of last year. One striking change in clothing is that ration coupons, used mostly for cotton cloth and cotton dresses in the past, are now used for knitwear, bedsheets, and indoor decorative cloth, while high- and medium-grade chemical fibers and silk and woolen knitwear now occupy an important place in clothing. Among the "three major items" of high-grade durable goods, 357,900 bicycles, a 31-percent increase over the same period of last year, more than 195,600 sewing machines, an increase of 25 percent, and 996,000 wristwatches, a 19.5 percent increase, were sold. Because of the improved housing situation in both urban and rural areas, there are now new demands for daily necessities. At present, it is quite common for people to make their own furniture, and the demand is growing for spring locks, padlocks, mirrors, and lacquer. At the same time, people are more keen on interior decorations, and sales of glassware have been very brisk. The lifestyle in the countryside is being gradually urbanized, and peasants in economically developed areas even want to buy sofas, floor lamps, TV sets, wooden tableclocks, and the "three minor foreign items." The demand for building materials, such as cement, glass, and timber, is now greater than the supply.

By the end of June, the savings deposits of the people in urban and rural areas had increased by 297 million yuan, a 12-percent increase over the amount at the beginning of this year.

NATURE OF SPECIAL ECONOMIC ZONES

HK170929 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 8, 20 Aug 81 pp 54-58

[Article by Fang Zhoufen [2455 0587 5358] of the Economic Research Institute of the Chinese Academy of Social Sciences: "On the Nature of China's Special Economic Zones"]

[Text] Special economic zones are a new thing in China. Ours is a socialist country. Why does China want to set up special zones? This is a matter of concern to quite a number of people. Therefore, it is necessary to make an analysis of the nature of the special zones.

I

Special economic zones are similar to the export processing zones that are found elsewhere in the world, and are a development of free trade zones. Free trade zones, as the term suggests, are regions where overelaborate procedures of taxation and customs are discarded so as to develop import-export trade and re-export trade. But export processing zones are areas where goods manufactured for export are developed. Historically, free trade zones (or free ports) can be traced back two centuries while export processing zones have only emerged in the past 20 to 30 years.

After World War II, the former colonies and dependencies proclaimed their independence one after another. But owing to the prolonged extortion by imperialism, they were economically weak and technologically backward. They wanted to develop their own national economies and realize the modernization of industry, but they lacked funds, technology and equipment, so they wanted to use foreign capital and introduce technology from abroad. On the other hand, some economically developed countries could no longer brazenly regard the underdeveloped countries as their colonies and semicolonies, yet they needed to adopt new forms to export capital to the underdeveloped countries, use the latter's cheap labor power and land rent as well as other materials in order to grab more economic interests. The export processing zones emerged as the situation required. Now more than 70 countries in the world have set up 350 export processing zones and free trade zones of different types. The names are many and varied: There are free trade zones, export processing zones, free industrial zones, free ports and free frontiers.

To set up an export processing zone, in general, a piece of land in a port or in a vital communications line is parcelled out, some preferential decrees are enacted (such as apart from a few materials, the import and processing of raw materials and spare parts and export of finished goods are exempted from taxation), basic facilities are provided and good conditions are created for the purpose of utilizing foreign capital and importing equipment and technology so as to develop industry, trade and tourism. The sovereignty of the export processing zones set up by the countries, rich or poor, belongs to the countries where the zones are set up. The choice of location and the scale of investment are decided by the countries concerned.

No more than 2 years have elapsed since the setting up of China's special economic zones. After the 3d Plenary Session of the 11th CCP Central Committee, the party and the state called on the people throughout the country to march towards the four modernizations and try their utmost to learn advanced experience from foreign countries in the light of the principle of self-reliance. Running special economic zones on a trial basis is an important task. In the latter half of 1979, in the light of the special conditions of Guangdong and Fujian Provinces, the Party Central Committee set up special economic zones in Shenzhen, Zhuhai and Shantou and Xiamen, and took Shenzhen and Zhuhai as trial-point units that were required to take the first step forward.

How are the characteristics of China's special economic zones manifested?

1) The administrative management organs of the special zones are put under the direct jurisdiction of the central government or the localities are authorized by the central government to be in charge of approving the investments of foreign businessmen and handling the matters relating to opening factories or running enterprises and other undertakings in the special zones and enacting and revising the relevant decrees and regulations.

2) Create good conditions for investment and initiate necessary basic infrastructure such as water supply and drainage, power supply, roads, navigation or air traffic, telecommunications, wharves, channels, land-levelling and warehouse storage facilities.

3) Put the market economy first. Owing to the fact that the sector of state capitalism and the sector of capitalism hold an important position in the special zones, it is necessary to carry out regulation by market mechanism in the light of the law of value. But this does not mean that we no longer need regulation by planning mechanism. Theoverall program of the special zones should be stipulated by state planning. From the view point of the whole country, this market economy of the special zones is only a supplement to the socialist planned economy. The area of a special zone generally covers only 200 or 300 square kilometers of land. (Note: The area of the Shenzhen special zone is only 327.5 square kilometers and some 90 square kilometers of land are available for construction. The area of the Zhuhai special zone only covers 6.8 square kilometers.) In China's 9.6 million square kilometers, this strip of land is only a pinprick.

4) The products of the special zones are export-orientated. The opening up of the country to the outside world is closely related to the international market. Therefore, the fluctuations of the world market, in particular those of the markets of Hong Kong and Macau will rapidly exert a bearing on the economy of the special zones. For this reason, a clear line of demarcation should be made between the special zones and nonspecial zones, segregating the latter from the former.

5) Stipulate various regulations for providing foreign investors with preferential treatment in the special zones, such as tax regulations (meaning import and export duties and income tax), registration of enterprises, financial administration, land administration, labor and wages.

The above-mentioned five characteristics indicate what is "special" about the special zones.

China's special economic zones and the foreign free trade zones have something in common, that is, the utilization of foreign capital, the expansion of exports, the increase of employment and foreign exchange, therefore, they have some similarities in their method of work. But they are different in nature. China's utilization of foreign capital is for speeding up socialist economic construction and exploring new experiences in expediting the four modernizations. But the setting up of free trade zones (the export processing zones) of the capitalist countries is for developing the capitalist economy. There is obviously a distinct difference in nature in the final aim owing to the difference in the social system.

China is a country with a huge population, a weak foundation and backward industry. To build the four modernizations, we lack funds, scientific and technological force and advanced managerial experience. Therefore, it is necessary to use foreign capital and introduce advanced technology from abroad. After the October revolution of the Soviet Union, the young Soviet Union crushed the imperialist armed intervention and it suffered serious damage economically. Lenin held that the Soviet Union should utilize foreign capital, absorb the experience of the West European capitalist countries and their achievements in science and technology. Lenin pointed out: "Without the help of foreign equipment and technology, we would be unable to revive the damaged economy by relying on our own strength alone." ("Collected Works of Lenin," Vol 32, p 171) During the 1920's and 1930's, acting upon Lenin's policy of utilizing the capital of the West to accelerate socialist economic construction, Stalin accepted foreign loans and signed technological agreements, imported machinery and equipment and advertised for foreign technological personnel. All this was of great help in laying a foundation for the Soviet Union's modern industry. Later the sabotage of the class enemy at home and abroad caused the suspension of this work.

We can use for reference the policy of Lenin and Stalin concerning the utilization of foreign capital and the introduction of technology and equipment in developing China's social productive forces and socialist economy. This tallies with the principle of seeking foreign assistance on the precondition of self-reliance, and is also the theoretical basis for us to set up the special zones.

The setting up of the special economic zones is for the utilization of foreign capital and introduction of technology and equipment. Therefore, whether or not the special zones can develop depends on whether or not they can draw upon funds from abroad and whether or not they can earn more foreign exchange with the limited domestic investment, thus ensuring the advance of the building of the special zones and providing socialist economic construction with some new experience that can be used as reference.

II

There exist varied economic sectors in the special zones. Apart from the enterprises run by our own country, there are joint ventures with Chinese and foreign investment and enterprises operated with foreign capital. Judging from the current trend of development, the economic sector of state capitalism constitutes a relatively big proportion. How should we understand these economic sectors of the special zones?

First, looking at the actual conditions, the Shenzhen and Zhuhai special zones have adopted the following forms in utilizing foreign capital: processing with the materials supplied, compensation trade, enterprises under joint management, joint ventures with Chinese and foreign investment and independently operated enterprises with foreign investment. These enterprises cooperate with the national economy or the collective economy in varying degrees.

1) Processing with materials supplied or assembling with materials supplied. There tend to be diverse methods of work in this form but they boil down to mainly two ways: One is that foreign investors are offered factory buildings and equipment and we do the processing and assembling with materials supplied by them according to contracts and deliver the finished products on schedule to Hong Kong businessmen. We have no proprietary rights over the products and only gain industrial charges (which include wages, charges for water and electricity, rent for factory buildings and houses, land rent and warehouse storage charges.) This form is mainly operated by the rural collective enterprises run by the communes and the production brigades. Although the amount of income in processing charges is not big, this form plays a certain role in providing employment, increasing the income of the communes, the production brigades and the production teams and improving the lives of the commune members. The other is the integration of processing with materials supplied through compensation trade. The foreign investors supply us not only with raw materials but also with equipment which is sold to us after appraising the prices and on our side we shall pay them back by installments with processing charges.

2) Compensation trade. This form involves the signing of contracts with foreign businessmen who loan the use of their machinery, equipment and technology. The prices for the machinery and equipment are fixed at the Hong Kong market price (or the international market price). On our part, payment for the machinery and equipment will be made by installments with the money paid for the products purchased. When the debt is cleared, the machinery and equipment are turned over to the Chinese side. The aquatic products catching and breeding of Shenzhen has taken the form of compensation trade. To make investment in opening factories, it is general practice to import relatively advanced equipment and technology. For example, the Shenzhen Printing House in which Hong Kong businessmen made an investment has printing machines made in West Germany which are of world advanced standard with the capacity of printing seven colors at one stroke.

3) Enterprises under joint management. This form is developing fairly rapidly. The contracts signed by the Chinese side and the foreign investors stipulate the rights and obligations of both parties. The foreign participants provide the enterprises with funds and equipment, and the Chinese participants, with land and labor power. The enterprises are put under joint management (or run and managed by the Chinese participants) and the profits will be shared in proportion. Repayment of the principal and interest to the foreign participants will be made by the Chinese side in the form of products and a fixed proportion of sales. According to the stipulations of the contract, on the expiration of the cooperation, the enterprises will be turned over to the Chinese side. Most of the enterprises under joint management involve housing and hotel construction.

4) Joint venture enterprises. This form involves the fact that foreign investors make an investment in running an enterprise with Chinese participants by becoming a shareholder. They undertake the costs of construction and equipment of the enterprise to be run while the Chinese party, with land, factory buildings and offices which are evaluated in terms of money as capital stock of the enterprise. The enterprise is managed jointly by both parties (including management system, managerial methods, commodity pricing and wage levels). Both parties are fully responsible for their own profits and losses, and share risks and profits. The joint venture enterprises are in general big in scale and advanced in technology and equipment as well as management. The foreign participants shall assign personnel to offer instructions in technology and management. The contract period of a joint venture enterprise is long and the profits are fairly enormous, so the foreign investors have relatively great interest in this form of investment.

5) Independent investment by foreign businessmen. Foreign businessmen (or Hong Kong businessmen) wishing to invest in opening factories should apply to the administration of the special economic zones and will be issued licences for registry and use of land after examination and approval. Then a certain area of land will be parcelled out for the foreign investors to set up enterprises operated solely with their investment (at present most of the enterprises which are approved for operation are engaged in the commerce and service trades). The Chinese participants provide them with land (the right to use not the proprietary rights over the land) and labor force, and land rent and taxes will be collected.

In the five above-mentioned forms to introduce foreign capital, the enterprises under joint management constitute the biggest proportion. By the end of 1980, in introducing foreign capital, Shenzhen reached 581 agreements with foreign businessmen worth a total of HK$1.6 billion. In the 581 projects, the cooperative form occupies 199 projects, constituting the biggest proportion in the investment volume. Right now agreements worth 1.4 billion yuan [as published] have been reached, accounting for 88.4 percent of the total volume of investment and averaging HK$7.16 million for each project. Next come the enterprises operated solely with foreign investment. There were only six projects in all, constituting 5 percent of the total volume of investment and averaging HK$13.33 million. At present joint venture enterprises are small in number, occupying 2.4 percent of the total volume of investment. Although the projects of processing with materials supplied were numerous, totalling 366 projects, the proportion of these projects in the total volume of investment was only 2.1 percent. There were four projects in compensation trade, constituting 2.1 percent in the total volume of investment and averaging HK$8.56 million for each project.

According to the analysis of the five forms to introduce foreign capital, the form of joint management holds a dominant position at present. It is an investment cooperation between two different social systems and two different systems of ownership. There are both the component of socialism and that of private capital in this kind of cooperation or in the enterprises under joint management. This form of joint management is a relatively typical form of state capitalism. There is a certain time limit on the right to use the land we give to the enterprises under joint management, each time limit being 10 or 20 years or even 7 or 8 years. On the expiration of the contracts, the enterprises or houses or hotels are turned over to the Chinese participants. Thus it can be seen that the joint ventures using Chinese and foreign investment, the enterprises under joint management and other forms in the special economic zones are all state capitalism under the leadership of the socialist regime.

Second, the state capitalism of the special zones is the development of the state capitalism expounded by Lenin years ago. Lenin summarized the state capitalism under the dictatorship of the proletariat as "the state capitalism that we can restrict, and determine the scope of its activities. This kind of state capitalism is related to the state." ("Collected Works of Lenin," Vol 33, p 244) Restricted by the historical conditions, the state capitalism advocated by Lenin did not develop properly in the Soviet Union as it should have done. However, his brilliant thesis is of great theoretical and practical significance.

The state capitalism in China's special economic zones and the lease-lend system and lease-let system practiced by the Soviet Union in those years have both identical and distinct aspects. They are identical in the utilization of foreign capital under the supervision and control of the socialist regime with the aim of building socialism. The distinct aspect is that under the lease-lend and lease-let systems practiced in those years in the Soviet Union, part of the state's mines, forests and oilfields were run on lease by the capitalists at home and abroad. The state grasped only part of the products to consolidate the worker-peasant alliance. In China's special zones, no state's factories or mines are leased out or let to any Chinese and foreign capitalists and no products are put under the state's control. We attract foreign capital to run industrial enterprises, open service trades or exploit resources, with the participation of the investment and joint management of the enterprises under the system of ownership by the whole people or those under the collective ownership system. As for the solely-operated enterprises with foreign investment, land rent and taxes are collected. Therefore, compared with the lease-let system practiced in the Soviet Union in those years, the state capitalism of China's special zones is more substantial in content and role.

The joint ventures using Chinese and foreign investment in the special zones belong to the state capitalist economic sector in nature, because there are cooperation and relations between China's socialist economy and the foreign capital within the enterprises. Even the enterprises with independently invested foreign capital in the special zones have a certain degree of state capitalism. Although they are operated by foreign capital, these enterprises carry on their economic activities under the supervision and management of the prletarian regime. They rent our land and hire our labor force and are restricted by China's policies. They have relations in varying degrees with China's socialist state enterprises (or collectively run enterprises) through various forms. Such enterprises are quite different from the enterprises operated by foreign investment before liberation which relied on the imperialist prerogatives in wantonly dumping goods, plundering raw materials, exploiting China's cheap manpower, and their business management was not subjected to the inspection and supervision of the departments responsible for the work.

Is the state capitalism in the special zones a duplication of the state capitalism introduced during the period of China's socialist transformation? Our answer is no. The state capitalism followed after China's liberation was a policy of utilizing, restricting and transforming the capitalist industry and commerce of the national bourgeoisie, and a policy of advancing the industrial and commercial enterprises of the capitalists through redemption and various forms of state capitalism from the early form in which orders were placed by the state with private enterprises for processing materials or supplying manufactured goods to the advanced form of joint state-private ownership and then to state-run enterprises. The current stress on our policy toward state capitalism in the special zones is to take advantage of foreign capital to serve China's socialist construction. Therefore there is also a difference between the capitalism now prevailing in the special zones and the state capitalism before China's system of ownership was changed.

The utilization of capitalism in the special zones today emerged in a situation in which China's socialist transformation has been completed, the capitalist ownership system has been abolished, and the regime of the people's democratic dictatorship has been consolidated. The introduction of foreign funds and the setting up of joint ventures using Chinese and foreign investment are conducive to the attraction of foreign capital, to the introduction of new foreign technology and equipment and the learning of advanced managerial methods. Certain exploitation of the workers by foreign capital in this respect is allowed. Their legitimate interests are guaranteed through some preferential treatment. This is inevitable. Talking about the lease-let system, Lenin said: "We have made some 'contributions' to capitalism throughout the world, and in some respects we have 'bought out' from them. At the same time we can at once find out definite ways and means for consolidating the position of the Soviet regime and improve our conditions for operation." ("Collected Works of Lenin," Vol 33, p 244) Regarding the state capitalism in the special zones, we are now adopting a series of policies and measures not only to restrict its unlawful activities but also to effectively ensure its lawful interests. If their economic activities endanger the interests of our country and violate China's laws, as in the capitalist countries, and they set up brothels, gambling dens, and engage in speculation and profiteering in the special zones, then they will be banned. Moreover, the scope of their activities is restricted within a certain limit. Is this kind of capitalism not a restricted capitalism? Is it not the capitalism we want to utilize to serve socialism?

Some people regard the special economic zones as the reappearance of concessions. This argument is utterly groundless. The concessions in old China were the products of aggression by the imperialist big powers who pursued gunboat diplomacy and took advantage of unequal treaties. Concessions were independent kingdoms of foreigners on Chinese soil. The foreigners held the ruling power and they could do as they pleased. China's sovereignty did not exist in the concessions. The Chinese in the concessions were subjected to the rule of the bureau under the Ministry of Works which was in the hands of the foreigners. The concessions became places for maneuvers of gambling, brothels, kidnapping, narcotics trafficking, smuggling, speculation and profiteering and human traffic and become an earthly paradise for adventurers to get rich quick. These kinds of concessions today have become historic spots. Today's special zones and the concessions in old China are different as black and white. Our sovereignty in the special zones is not affected and the foreigners residing in the special zones are subject to the laws of the special zones. Under these circumstances, how can we lump together the present special zones and the concessions in old China?

III

How to run well the socialist special economic zones is a problem at present that needs exploration. In my opinion, attention should be paid to the following points:

1) First of all it is necessary to create good conditions in a planned way and do a proper job of the basic infrastructure. Shenzhen and Zhuhai have completed part of the basic construction, and Shekou has even gone a step further in this respect. Lack of deepwater ports has become a flaw in the favorable geographical conditions of the special zones. This can be nothing but a defect of the export processing zone. There is a lack of funds in the expansion of Shekou port and the construction of Paotaishan port of Zhuhai. It is necessary to solve this problem by seeking the utilization of foreign capital.

2) A clear dividing line between the special zones and nonspecial zones and a strict segregation of the former from the latter should be made, and the thoroughfare management should be strengthened. A line of demarcation has been made between the special zones and the interior. This is an important measure for forming the special zones and intensifying the management of the special zones. If we abolish the line of demarcation between the special zones and the interior (nonspecial zones) and merge the former with the latter, then why should we take the trouble to set up the special zones? Of course, the relations between the development of the special zones and the interior should not be cut off. The development of the special zones will get nowhere without the support of the interior. The method of finding out a single solution for diverse problems is extremely detrimental to the development of the special zones. It is necessary to establish relations to a certain extent with the interior in a planned way, and conclude agreements with other provinces and localities so as to obtain supply of nonstable foodstuffs and other materials from the interior. The export departments of foreign trade should also support the supply of the special zones as much as possible.

3) The special zones can make use of the joint ventures using Chinese and foreign investment and enterprises using independent foreign investment as schools for training cadres. They should train a technological force capable of mastering modern equipment and a number of backbone personnel in enterprise management in a planned way. If we have sufficient technological and managerial forces, we are sure to improve the competitiveness of the special zones on the international market. Second, after the turning out of this technological force, we are already in a position to gradually replace the foreign personnel in the enterprises and to support the other localities and make contributions to the four modernization drive.

4) The special zones should have socialist culture and education. Owing to the segregation of the special zones from the interior and the people in the special zones coming into contact with the capitalist culture from Hong Kong and Macau more frequently, this calls for the enhancement of the work of education. We must place emphasis not only on the economic construction of the special zones but also on the cultural construction of the zones. We must set up our own radio station and run our own newspapers and magazines, establish a complete set of educational establishments (from kindergartens to middle schools and vocational schools), and set up places for cultural recreation. Apart from being capable of going all out to develop the economy, the cadres in the special zones must have modern scientific know-how and acquire the skills to manage enterprises. They must manage to struggle against the corrosive influence of bourgeois ideas. If the cadres are not immunized from disease, they are apt to find themselves in the mire. Therefore it is an important task to do a good job in the fields of politics, culture and education of the special zones.

5) Apart from carrying on the construction of the basic infrastructure, it is necessary to do well the sanitation of the special zones. Now that the Shenzhen railway station is an international commercial bridge, a passage for the intercourse between the compatriots in the mainland and those from Hong Kong and Macau, we must take doing a good job of environmental sanitation as an important task.

The special economic zones are in their initial state. The policies and measures have not yet been implemented fully, the organizations have not been strengthened, the enactment of laws has not been perfected, and there is a lack of managerial experience. Therefore we should constantly sum up experience in practice and make them perfect step by step.

EXHIBITION CENTER--Guangzhou, 11 Sep (XINHUA)--An exhibition center of foreign commodity samples opened this week at the former site of the Guangzhou Export Commodities Fair. More than 6,000 samples, including home electrical appliances, wristwatches, textiles, pottery, arts and crafts, hardware, foodstuffs and animal byproducts from 32 countries and regions are on display. The long-term exhibition center, operated by the Guangdong Provincial Foreign Trade Bureau, provides special counters and spaces for foreign firms and firms in Hong Kong and Macao. The services also include canvassing customers at home and abroad, offering advice on imports and exports, buying commodities samples and sponsoring meetings to exchange Chinese and foreign technology. EXPERIMENTS IN PIECEWORK WAGES AS MATERIAL INCENTIVE

Nanjing XINHUA RIBAO in Chinese 22 Jul 81 p 1

[Article by correspondents Yang Hanliang [2799 3352 5328] and Wang Yuzhang [3078 1342 1728]: "System of Piecework Wages as Reward for Above-Quota Production Tried Out by Plants in Changzhou"]

[Text] The economic committee, labor bureau, and finance bureau of Changzhou recently summed up the experiences in the experiment of a piecework wage system as a reward for above-quota production among a number of plants. This system was highly regarded as a form of economic responsibility system for industrial enterprises, and should be promoted among the units under suitable conditions.

The experiment began in the last quarter of 1980. At that time, 20 industrial enterprises were designated for the experiment, with nearly 10,000 workers and staff members trying out this wage system. To qualify for the experiment, these enterprises should be able to produce regularly, always have sufficient tasks on hand, turn out readily marketable goods of reliable quality under good management, and be given rational quotas. During the experiment, the system of piecework wages can be adopted by the enterprises as separate units or by their workshops, workteams, or work groups as small collectives when quotas have been fulfilled. It can also be adopted among the workers as individuals directly paid for piecework. Either of these forms can be chosen according to the enterprises' own operating conditions. There will be basic wages for fulfilling quotas, above-quota wages for above-quota production, and deduction of basic wages for failure to fulfill quotas. Quotas and unit prices should remain unchanged for a certain period, and there should be no limit to the earnings of the individual workers and staff members. Should there be any deterioration of quality, excessive consumption of raw materials or energy, or increase in production costs, the experiment will be suspended.

Experience over more than 6 months have shown many advantages for this system. First, the practice of "eating out of the same pot" has been changed, because this system embodies the principle of paying each according to his work. In the past, doing more work or less work made no difference in the awarding of bonuses. After the introduction of the system, there will be more pay for more work, less pay for less work, and different pay for different qualities of work. Last April, each person at the three production workshops and one spare-parts workshop of the Changzhou No 1 Radio Plant received an average of 8.89 yuan for above-quota wages. Among them, 103, or 29 percent, received from 10 to 20 yuan, while 24 of them or 6.7 percent, received from 20 to 30 yuan. The largest amount received was 36.41 yuan. Four persons had their wages deducted because of failure to fulfill the quota or irregular attendance. The total amount deducted from their basic wages was 14.16 yuan.

The practice of this wage system has linked individual income with production quotas and has further aroused the enthusiasm of the workers and staff members. Before the experimentation with this wage system, the spinning workshop of the Changzhou No 2 State Cotton Mill was understaffed and its production efficiency was low. After the introduction of this system, however, output increased, even though the number of personnel was reduced from 156 to 117. Formerly, 49 persons worked on the packing of finished products at the Dongfanghong Dyeing Plant in Changzhou. After the introduction of the piecework wage system, the number of workers was reduced by 10, but the task was completed as usual.

The new wage system experiment has also promoted the reform of enterprise management, because these units have generally improved their firsthand statistics and strengthened their overall quality control and overall economic accounting. After adopting this system, the Changzhou No 1 Garment Factory improved its quality-control apparatus, revised its plans for upgrading quality, and solved a number of key problems affecting the quality of its products. While increasing its output by a wide margin, it has also effectively raised the quality of its products and won prizes for its Lanling-brand men's shorts produced for the domestic market--first prize in the annual provincial evaluation and second prize in the annual national evaluation of garments. None of its export products has ever been rejected or returned.

The experimental units have also increased their comprehensive economic benefits. After practicing the piecework wage system, total industrial value for the first 5 months of this year exceeded that of the same period last year by 44.5 percent. Output of their four main products increased by 17.9-128 percent, production cost were 4-18 percent lower, and profits increased by 248,900 yuan. All economic indexes reached their highest levels in history, and the above-quota wages for the workers increased markedly.

BRIEFS

JOBS FOR BEIJING YOUTHS--Since the beginning of 1981, Beijing municipality has created many new jobs for youths awaiting employment. Although jobs were arranged for more than 500,000 youths in the past 2 years, there is a greater demand for jobs this year. Moreover they are rather promising since leaders at all levels have attached great importance to it and various potentials have been exploited. The types of jobs which have been created include: 1) independent commercial and service trades to facilitate life in the local units; 2) domestic handicrafts work to overcome the problem of there being not enough space in plants to accommodate all workers and to provide more jobs for youths awaiting employment; and 3) commercial and service trades set up in places where people need them. [HK090939 Beijing City Service in Mandarin 2300 GMT 24 Aug 81]

HENAN YOUTH EMPLOYMENT WORK--Henan has vigorously developed collective enterprises. Over the past 4 years, they have provided jobs for more than 760,000 people awaiting employment in the urban areas, which amounted to 87 percent of the total number of people for whom jobs should be provided. For instance, in the first 7 months of this year, jobs were provided for more than 160,000 people. [HK161236 Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 7 Sep 81]

ANHUI PRODUCTION SAFETY MEETING--The Anhui Provincial People's Government held a provincial conference on production safety in Hefei 1-5 September. The meeting called on industrial and transport departments throughout the province to take effective measures to protect the safety and health of workers and prevent accidents that can cause death or injuries. (Hu Xiaofeng), vice chairman of the provincial economic commission, relayed the guidelines of the national safety work conference. Vice governors Meng Jiaqin and Huang Yu made a work report and a concluding report respectively. [OW141516 Hefei Anhui Provincial Service in Mandarin 1100 GMT 11 Sep 81]

JILIN INCOME RECORDS--According to statistics compiled by the Agriculture Ministry in 1980, of the 343 prosperous counties in the country, which had surpassed 150 yuan of per capita income, six municipalities and counties across Jilin Province met standards. They are Jian, Wangqing, Changbai counties and Siping, Tumen and Yanji municipalities. The per capita income of Jian County was 153 yuan: Wangqing County, 160 yuan; Changbai County, 162 yuan; Siping Municipality, 181 yuan; Tumen Municipality, 204 yuan; and Yanji Municipality, 220 yuan. GENERAL

UN CONFERENCE ADOPTS LDC ECONOMIC PROGRAM

OW151851 Beijing XINHUA in English 1830 GMT 15 Sep 81

[Text] Paris, 14 September (XINHUA)--A programme of action to support the 31 least developed countries in the world to achieve rapid economic development was approved at the end of the United Nations conference on the least developed countries here yesterday.

Entitled "Substantial New Programme of Action for the 1980's for the Lease Developed Countries," it declares that the objective of the programme is "to transform their economies toward self-sustained development and enable them to provide at least internationally accepted minimum standards of nutrition, health, housing and education as well as job opportunities to all their citizens, and particularly to the rural and urban poor."

The programme reaffirms that "urgent actions should be taken by all the members of the international community to end without delay colonialism, imperialism, neo-colonialism, interference in internal affairs, apartheid, racial discrimination, hegemony, expansionism and all forms of foreign aggression and occupation, which constitute major obstacles to the economic emancipation and development of the developing countries."

The programme says that during the 1980's every effort must be made to implement programmes and projects which will enable each least developed country to increase its national income substantially, doubling it by 1990 as compared to the level reached in the late 1970's, which would require an annual growth rate of 7.2 percent.

It also says that in the agricultural sector, least developed countries must aim to move towards and if possible surpass the 4 percent annual target so that food production in each country increases faster than population growth. Concerning manufacturing, the least developed countries should aim to increase their rate of manufacturing growth to an over-all annual growth of 9 percent or more.

The programme notes that the least developed countries should give top priority to agricultural production. In the meantime, forestry, fisheries and livestock breeding should also be developed, and high priority should be given to comprehensive and integrated rural development.

Regarding the human resource, the programme says that efforts should be made in the least developed countries during the 1980's for reducing the absolute numbers of illiterates and out-of-school children. These countries should aim at making primary education free and compulsory by 1990 at the latest. Vocational training must also be developed so as to respond to the requirements of the economy. It also calls for taking appropriate measures for family planning and population control.

On international aid for the least developed countries, the programme says that to achieve the objectives of the programme of action, the international community, particularly the developed countries, must increase their financial and technological aid and grant preferential treatment in trade for the least developed countries.

The programme says that the preferential aid for the least developed countries to be provided by the international community, particularly the developed countries should by 1990 reach 24 billion U.S. dollars (at 1980 price) or four times the level in late 1970's.

The programme emphasizes the necessity of a substnatial increase in Official Development Assistance (ODA). "Most donors of ODA will devote in the coming years 0.15 percent of their GNP to the least developed countries. Others will double their ODA to the least developed countries in the same period."

The programme says that the donor countries and institutions should "provide, as a general rule, assistance to the least developed countries as grants, provide loans mutually agreed upon on highly concessional terms."

In order to aid the establishment of food security in the least developed countries, the programme demands the conclusion of a new international wheat agreement and the actual establishment of a 500,000 tonnes international emergency food reserve.

To ensure full implementation of the programme, the programme points out that a mid-term global review of progress towards the implementation of the programme should be undertaken in 1985. It will also readjust as appropriate the programme of action for the second half of the decade.

BRIEFS

ZHEJIANG ANTISMUGGLING PATROLS--In the past 6 months and more, the 1st maritime anti-smuggling detachment of Wenzhou Prefecture has caught 24 smuggling vessels and confiscated smuggled goods worth more than 4.7 million yuan. Some smuggling trades were conducted between motor junks from Zhejiang coastal areas and steamships from Taiwan. The smuggled goods included watches and piece goods. [OW180943 Hangzhou ZHEJIANG RIBAO in Chinese 7 Sep 81 p 1]

HEILONGJIANG SMUGGLING CASE--The Harbin customs office, Heilongjiang Province, recently cracked a smuggling case, confiscating smuggled goods worth 150,000 yuan and imposing a 30,000 yuan fine on a native of Guangdong Province. The Harbin radio equipment supply station, which illegally sold smuggled goods, was fined 9,000 yuan. [SK150959 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 14 Sep 81]

BRIEFS

TAIWAN'S ECONOMIC GROWTH--The economic growth rate of the Republic of China stood at 5.32 percent during the first half of this year. It is expected to reach 5.78 percent in the third quarter, according to statistics the Directorate General of Budget, Accounting and Statistics [DGBAS] released Wednesday. The DGBAS said that the third quarter estimate was made before the flood disaster on 2 September. However, the flood disaster will make only small impact on economic growth here. The Executive Yuan's Council for Economic Planning and Development (CEPD) held a meeting Wednesday, hearing DGBAS reports on the economic growth for the first half and the third quarter of this year. The DGBAS said that economic growth was 5.01 percent in the first quarter, and rebounded to 5.63 percent in the second quarter. Because the U.S. dollar has a trend of moving upward, the Central Bank of China then readjusted the foreign exchange rates in mid-August, thus reviving export sales and agricultural and industrial production. As a result, third quarter growth is expected to move upward to 5.78 percent. [Text] [OW180148 Taipei CHINA POST in English 11 Sep 81 p 10]

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

MORE SCIENTIFIC FORMULATION OF MACROECONOMIC POLICY URGED

HK230204 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 8, 15 Aug 81 pp 17-20

[Article by Sun Xiaoliang [1327 2400 5382]: "How Economic Leadership Departments Can Make Their Macroeconomic Policy Formulation More Scientific"--passages enclosed in slantlines printed in boldface]

[Text] (I) An important lesson from the experience of Economic Construction

Over the past 31 years, our country's total output value has grown very rapidly. Except for a few years, the annual growth rate always stayed above 7 percent. The accumulation rate was also very high, reaching around 30 percent in the majority of these 31 years. However, we did not achieve the desired economic results. Only 69 percent of the total investment was converted into fixed assets. Only 46 percent of it has genuinely played a role in the economy. The standard of living of the masses of people has not been improved to the desired extent. Huge amounts of capital funds have been wasted or have been tied up because of overstocking.

There are many reasons for this situation. An important lesson from our experience is that our macroeconomic policy formulation was unscientific. This was reflected, in practice, in the formulation of unrealistic principles and policies, the lack of a scientific basis in formulating construction plans, the issuing of arbitrary and impracticable directions, and so on.

Examples of unrealistic principles and policies include the continuous promotion of production relations to higher levels, causing them to surpass the level of development of the productive forces; principles that violated the laws governing socialized large-scale production, such as principles requiring each province to become a self-contained economic system, requiring each locality to produce a balanced assortment of materials and to make available complete sets of equipment, and so on; slogans such as putting an end to the situation of having to transport coal from the north to the south, and so on; policies concerning the use of fuel, such as switching from coal to oil and then later inconsistently switching from oil to coal, and so on; and so forth.

Examples of the lack of a scientific basis in formulating construction plans include the following: The 10-year plan stipulating the building of 120 major projects was put forth before the possibility of making the funds available was calculated. Imports were made on a massive scale before the availability of foreign exchange was ensured, so with regard to some imported items, though contracts had been signed, their implementation had to be postponed or the contracts had to be amended because of a lack of funds. The project of "supplying Sichuan's natural gas to other provinces" was decided upon before the natural gas reserve was cearly ascertained, so that the project had to be discontinued halfway because of the inadequate reserve. Numerous major projects were started before raw materials, motive power or complete sets of equipment were available. Some completed projects incurred losses right from the time they went into operation.

In our economic life, there have also been numerous instances of issuing arbitrary and impracticable directions. Sometimes, major economic policies were formulated on the basis of some "tendencies" or of some leaders' feelings. When the call for developing the iron and steel industry on a massive scale was issued, several hundred thousand people were directed into this effort; everywhere primitive blast furnaces were set up; trees were cut down when coal was not available; in many regions, highly valuable forestry resources were destroyed; and consequently money and manpower were wasted, with the losses being greater than the gains. When the slogan of "do away with the dictatorship of rules and regulations" was put forth, all enterprises were put under lower administrative levels. Some enterprises which provided services on a nationwide scale were also put under county authorities. The consequence was chaos in economic life over a period of time. To develop a dozen or more daqings was merely casual talk, but this turned out to be the basis for formulating plans for opening up oilfields.

These ways of formulating macroeconomic policy, which were unscientific or even contrary to science, resulted in losses, some of which are incalculable. Therefore, we must make our macroeconomic policy formulation more scientific; that is, we must make it compatible with the objective reality and economic laws, and we must have an accurate numerical basis and must perform quantitative analysis. If this problem remains unsolved, the national economic proportional relations will be disrupted again even if they have been readjusted, and the economy will not be markedly improved.

(II) The Importance of This Problem

The problem of making macroeconomic policy formulation more scientific is an extremely important problem, rather than being an ordinary one. It affects the future and destiny of the planned economy. It is connected with whether the superiority of the socialist system can be brought into play, and whether the system of ownership by the whole people will degenerate.

The founders of scientific socialism clearly stated that the basic contradiction in the capitalist system is that between the socialization of production and the private ownership of the means of production. The forms of expression of this basic contradiction are the class antagonism between the proletariat and the bourgeoisie, as well as the anarchic state of social production. This contradiction can be radically resolved through the seizure of public authority by means of the proletarian revolution, and the exercise of this authority to make possible the social ownership of the means of production, to free the means of production from their subordination to capital, and to acknowledge their social nature. On the basis of public ownership, the anarchic state of social production must give way to regulation by planning mechanism, and social labor time must be consciously allocated according to proportions among various categories of production, so that the development of the productive forces can be promoted. [HK230230] This is an important manifestation of the superiority of the socialist system. However, the goal of proportionate development can be attained only with scientific centralized social planning. Bitter experiences at home and abroad have proved that unscientific centralized social planning will only lead to the artificial disruption of proportional relations. Moreover, the consequences of disrupting the proportional relations "in a planned way" are much more serious than those of the spontaneous disruption of the proportional relations. Precisely because of this, although we have instituted the public ownership of the means of production and have adopted the planned economy, the superiority of the socialist system has not been fully brought into play because the formulation of many macroeconomic policies has been unscientific.

To demonstrate the vitality of the planned economy, we must not rely mainly on "theoretically explaining" its superiority. Instead, we must "prove" its superiority "through practice." If our planning is unrealistic, violates economic laws, is marked by the lack of accurate data as its basis, and is effected through the "invention of ideas" by a minority of people, then the reputation of the planned economy will certainly be tarnished, and its prestige will certainly be damaged. The First Five-Year Plan was rather satisfactory. It really effectively guided our national economic development and enabled people to realize the superiority of the planned economy. However, late on, for one thing, attempts were made to continuously widen the scope of planning and increase the contents of our plans, so that our work load was divorced from our actual capabilities and standards. For another thing, the setting of high targets and the issuing of arbitrary and impracticable directions gradually became dominant, and criticisms were continually launched against right conservatism and the passive maintenance of equilibrium; and consequently, our planning became less and less scientific. If things continue like this, the prestige of the planned economy among the people of the world will be utterly destroyed, and the planned economy will be deprived of its vitality.

Unrealistic policy formulation, unscientific planning for construction and issuing arbitrary and impracticable directions, actually amount to the degeneration of the system of ownership by the whole people. In our country, such ownership is realized through the ownership of the means of production by the state in the name of the people. Real life experience tells us that when our state organs formulate economic policies, there may be two categories of possible results with regard to whether such policies represent the common will and interests of all of the people. When the economic policies formulated by the state are scientific, the implementation of such policies inevitably promotes our national economic development. This amounts to representing the people's common will and interests, and the realization of ownership by all of the people. When the economic policies formulated by the state are unscientific, the implementation of such policies inevitably lead to hugh losses and waste. This is against the common will and interests of all the people. However, the laborers are incapable of doing anything about it. Therefore, this actually amounts to the disintegration of ownership by all of the people.

Thus, from whichever point of view, we should not consider the problem of making macroeconomic policy formulation more scientific as an ordinary or minor problem.

(III) How To Make Macroeconomic Policy Formulation More Scientific

The major requirement is that we must eliminate the influence of "leftist" ideology in economic work. An increasingly large number of comrades are beginning to realize this point, and are effectively performing work in this respect. The power of economic policy formulation must be linked to the responsibility for the consequences of implementing economic policies. We must put an end to the situation in which the subjectivist issuing of arbitrary and impracticable directions causes losses to the state amounting to hundreds of millions of yuan, and the policymakers shoulder no responsibility for these economic consequences. Aside from these two methods, we must, by reforming our economic management systems, make our methods of organization and our systems capable of ensuring more scientific macroeconomic policy formulation.

We must not believe that the reform of our economic management system merely amounts to expanding the enterprises' decisionmaking power. When the enterprises' decisionmaking power is expanded and microeconomic activity is promoted, there will be an urgent need to strengthen guidance by planning. The formulation of plans must be scientific, and the means of guidance must be powerful, so that the conscious and proportionate development of the entire national economy can be ensured. To achieve this, we should include at least the following three elements in the reform of our economic management system. (1) The enterprises under the ownership of the whole people should "be subjected to ownership by the whole people, practice independent accounting, and assume sole responsibility for their profits and losses," so that the power to run the enterprises independently, and an internal motive force that promotes continuous improvements in management and operations will be available. (2) We must reform the functional, organizational and personnel structures of government departments in charge of economic management, so that macroeconomic policy formulation can be made more scientific. (3) We must reform and perfect the agencies of economic regulation, and flexibly employ various means of regulation, so that a "bridge" can be established between the state's macroeconomic policy formulation and the enterprises' microeconomic policy formulation. [HK230312] If these three categories of reform are carried out, then the enterprises' and the workers' enthusiasm, initiative and creativity can be brought into play, and microeconomic results will be improved; and moreover, proportionate national economic development can be consciously maintained, so that macroeconomic results will be ensured.

A rather popular view holds that if the enterprises assume sole responsibility for their profits and losses, then the government departments at various levels responsible for economic management can be combined or abolished. Actually, things are quite far from being so simple. When the enterprises have been assigned greater decisionmaking power, not only must the government departments responsible for economic management use a new set of methods to guide economic activities so as to ensure the achievement of overall equilibrium, but macroeconomic policy making must really become scientific. This is a very arduous task. Therefore, for the economic management departments of the state, reform is not merely a matter of simplification, combination and abolition, but amounts to a series of structural reforms.

/First, the functional structure must be reformed./ At present, our government departments responsible for economic management are actually performing two categories of functions. First, they study and formulate principles, policies and plans concerning national economic development. Generally speaking, this function lies within the scope of macroeconomic policy formulation. Second, they organize and direct the enterprises' activities in production, supply and marketing. Generally speaking, this belongs to the scope of microeconomic policy making. At present, a large proportion of their time and efforts are actually used to organize the enterprises' production, supply and marketing activities. The work of studying and formulation principles, policies and development plans is done in a very crude manner. With the assumption of sole responsibility for profits and losses by the enterprises and the assigning of microeconomic decisionmaking power to the enterprises, this functional structure must undergo a major reform. With the implementation of the reform, the economic management departments will inevitably have to do some work in coordinating production, supply and marketing, but their main function and key task will be macroeconomic policy formulation, to which they must devote the greater proportion of their time.

/Second, we must reform the organizational structure./ At present, our government departments responsible for economic management actually consist of two categories of organizations. The first category are organs of power, which are mainly responsible for organizing, directing and controlling production, distributing funds and material resources, deciding upon construction projects, and so on. The second category are advisory bodies, which are mainly responsible for making investigations about and studying principles and policies, compiling and analyzing information, studying development plans, designing schemes for policy formulation, and so on. Judging from present circumstances, specialized advisory bodies are too few. Their work is mostly concurrently performed by organs of power, so that it is very difficult to perform such work meticulously and to a great depth. Our past mistakes of various types of macroeconomic policy formulation were to a great extent due to the underdevelopment of such advisory bodies. The formulation of an economic policy generally involves three "subprocesses." First, we must compile adequate and accurate data, some of which may be collected for a short period of time, but most must be collected on an annual basis. If we do not compile and analyze information in this way, it will be impossible for us to formulate our policies on a scientific basis. The second stage is to design schemes for policy formulation. On the basis of mastering and analyzing an adequate amount of information, we must design a number of schemes for policy formulation, analyze the feasibility of these schemes, and clearly know the advantages of each. This requires a great deal of expert knowledge and a large number of qualified specialists. The last stage is to select the right policy. The person or group responsible for decisionmaking will choose one from a number of schemes presented for implementation. That is, he or they will "have the final say." The first two stages involve a great deal of work which cannot be performed by a policymaker or a number of policymakers, but must be done by advisory bodies. Without those bodies which are essential for compiling information and designing schemes for policy formulation, the policymakers will not have any accurate data, any quantitative analysis findings, or a number of schemes to compare and select from, as was the case of "supplying Sichuan's natural gas to other provinces." Under these circumstances, even if the policymakers are technical experts, it will be very difficult for them to formulate scientific policies, even after repeated group discussions. The reason is very simple. They lack the requisite basis for scientific policy formulation. Therefore, with the expansion of the enterprises' decisionmaking power, the organs of power should be simplified, combined or abolished, while the advisory bodies should be increased and strengthened. We must also establish, as quickly as possible, certain bodies which have not been established, such as an overall national economic planning department, whose establishment has been repeatedly proposed by Comrade Qian Xuesen.

[HK230340] /Third, we must reform the personnel structure./ The need for reforming the personnel structure arises from the reform of the functional and organizational structures. On one hand, with the vanishing of the function of organizing and directing production, supplying and marketing activities, and with the decrease in the number of organizations, the size of the contingent of personnel will inevitably be correspondingly greatly reduced. On the other hand, with the rising need for scientific macroeconomic policy formulation, and with the strengthening of advisory bodies, there must be a great increase in the number of people needed for the satisfactory formulation of macroeconomic policies, such as experts in social engineering and systems engineering, mathematicians, statisticians, economic management experts, and so on. Such is the reform in the personnel structure of the state's economic management departments.

Abstract reasoning invariably does not leave such a deep impression as concrete facts do. Because at present, people have not adequately paid attention to this issue, it is necessary to introduce here some relevant circumstances in Hungary. Not long ago, some personnel of Hungary's Central Statistical Bureau told the comrades of our country's observation group that subsequent to their economic reform, the work of their statistical bureau changed greatly and they began to pay greater attention to analyzing major problems; for example, analyzing and studying the effects of various regulatory means on the economy, studying how net income can be optimally distributed between the state and the enterprises, studying the enterprises' wages funds and their relationship with the accomplishment of tasks, and so on. Every year, the bureau conducts a family livelihood survey of 2,300 families of various types, such as those of workers, peasants, mental workers, retired persons, and so on. It analyzes facts related to their income and consumption, and also changes in their consumption pattern. A special research office under the statistical bureau is responsible for making forecasts, three times a year. Once every 2 years, the bureau prepares an input-output table providing information about 30 sectors, and once every 3 to 5 years, it prepares another such table concerning 100 sectors. Some 1,000 people of the statistical bureau, or approximately 7,000 people if those belonging to local statistical departments are included, are involved in the carrying out of these tasks.

What we have described is just a small part of the work which must be done to do a good job of macroeconomic policy formulation. However, we can see from this that making macroeconomic policy formulation more scientific cannot depend on our wish alone; it requires us to do a great deal of arduous and meticulous work. The agencies and personnel of our existing economic management departments are incapable of meeting the needs. Not to mention the issuing or arbitrary and impracticable directions, marked by "great determination with little knowledge of the situation," our government bodies and personnel are probably incapable of doing a good job of scientific economic policy formulation. Last year, several mathematicians proposed using the scientific method of input-output tables to achieve a satisfactory comprehensive national economic equilibrium. According to our knowledge, some foreign friends have also put forth similar ideas. This is really necessary in the light of the requirements of making economic policymaking more scientific. However, this is not feasible in the light of the foundation of our work and other objective conditions. The way out is to reform the functional, organizational and personnel structures of our economic management departments, so that conditions will be created for the attainment of this goal.

NATIONAL POLICY AND ISSUES

RECLASSIFICATION OF BRANCHES OF NATIONAL ECONOMY NEEDED

Beijing TONGJI [STATISTICS] in Chinese No 2, 10 Jun 81 pp 35-37

[Article by Li Huihong [2621 1863 1347]: "Some Views on the Classification of Branches of Our National Economy"]

[Text] Since 1955, China has been classifying the branches of the national economy for planning and statistical purposes. Under the present conditions, the classification is not quite scientific and should be revised. Our country is now working out its Sixth Five-Year Plan and some long-range plans, and it has decided to start the third national census on 1 July 1982. Many data will be sorted out according to the different branches of the national economy; therefore, a timely revision of the classification of the branches of our national economy is urgently needed. How will the revision be carried out? Here are some of my personal views, offered for reference and study, on some related problems.

I. System Used as Basis for Revision of Classification

In Western countries, classification of the branches of the national economy is called "classification of production in all economic activities" (translated as classification of production or classification of trades). Bourgeois economists hold that all remunerative economic activities are productive as components of social production. On this basis, they divide the structure of production into three different parts:

Primary production--consisting mainly of agriculture, which includes animal husbandry, forestry, fishery, and hunting.

Secondary production--consisting mainly of manufacturing trades, also including mining.

Tertiary production--also called production of a service nature, including construction, transportation, communications, commerce, banking, professional services, administration, and the practice of law.

This method of classification is consistent with the requirements of human life, the division of social work, and the development of economic activities. However, the contents of the tertiary production as so classified have been constantly revised in Western countries. In Japan, for example, the construction trades have been taken out of tertiary production and listed among mining and manufacturing under secondary production. Simon Kuzmetz, a U.S. economist, has classified communications, transportation, and the supply of electricity, gas, and water as secondary production. In India, "mining including extraction of ores and tunneling" is included in primary production. From this, we can see that although the methods of classification used by Western countries are generally the same, a unified method of classification is still lacking, and the demarcation between the different categories is not clearly defined. The "Standard International Classification of Trades" set up by the United Nations does not insist on a unified standard of classification by all countries, as long as the small branches of different categories can be reconciled.

The method of classifying national economic branches adopted in the Soviet Union and the member nations of CEMA in Eastern Europe is called the Eastern System; in it, all trades and professions are divided into two major sectors--the material-production sector and the nonmaterial-production sector. The Soviet classification of national economic branches is as follows:

I. Material-Production Sector: (1) Industry; (2) Agriculture; (3) Forestry; (4) Transportation; (5) Posts and telecommunications; (6) Construction; (7) Commerce; (8) Public catering service; (9) Supply of material and technical services, marketing, and procurement.

II. Nonmaterial-Production Sector: (1) Housing, public utility and daily community service; (2) Public health, sports, and social security; (3) Education; (4) Culture; (5) The arts; (6) Science and scientific services; (7) Credit and national insurance; (8) State and economic management organizations.

According to Marxist theories of political economy, the production of materials under any social system is the foundation of the existence and development of human society. Material production means the production of capital goods and consumer goods required by human society. The sum total of products from all material-production sectors forms the total social product. There must be an accurate demarcation between the material-production sector and the nonmaterial-production sector in the national economy before we can study the relationship between the accumulation and consumption of national income and the relationship between distribution and redistribution in the course of social reproduction, and also before we can study the relationship and ratio of exchange between the first and the second category within the realm of material production and the determine the speed and scope of expanded social reproduction. Therefore, it is my opinion that the three different types of production as classified by Western countries have the following defects:

First, the lack of a concept of difference between material-production sectors and nonmaterial-production sectors. Primary production and secondary production in the West come under the material-production sector, while tertiary production belongs mainly to the nonmaterial-production sector. Yet, tertiary production includes construction, transportation, communications, commerce, catering, and the supply of electricity, gas, and water--some of which belong to the material-production sector. Certain exceptions may be found in the branches or subbranches of the sector, but such exceptions are rare or in some cases nonexistent.

Second, the lack of demarcation between industry and agriculture. Demarcation between industry and agriculture is of great significance for an analytical study of the process of social reproduction. The process of production and reproduction in agriculture, forestry, and fishery goes hand in hand with the natural growth and propagation of animals and plants. The end of growth and propagation for animals and plants in natural life marks the beginning of their involvement in industry. In the sense of production, ocean fishing, lumbering and other forms of exploitation of natural resources are, like mining, under the category of industry. Yet Western countries and the United Nations list them under the category of agriculture, forestry, and fishery, while some countries place mining on the same footing with agriculture, to be classified as primary production, thus blurring the demarcation and relationship between industry and agriculture.

Third, the lack of a complete and independent industrial concept, although, according to the Western method of demarcation, industry is an important sector in the sphere of material production. Sometimes, Western countries view processing industries in the same light as they do mining, while supply of electricity, gas, and water is included in tertiary production. Sometimes, mining is detached from industry and classified as primary production along with agriculture, forestry, and fishery; sometimes, construction, transportation, and communications are associated with mining and the processing industry, to be included in secondary production. There seems to be no end to the confusion.

Finally, it may be pointed out that although the nonmaterial-production sector does not produce material objects, the labor involved is necessary in a socialist society as well as the overwhelming majority of a capitalist society. It shows the enrichment and improvement of people's cultural and material life as a result of higher social labor productivity. In a modern society, the major branches of the nonmaterial-production sector should be singled out for separate study. However, these departments are only loosely defined in Western countries. According to the standard classification by the United Nations, the entire nonmaterial-production sector is divided into only two departments: government, society and personal services; and banking, insurance, real estate, and business services. This method of classification is unsuitable for studies of the development of culture and the promotion of welfare in society.

Classification of the branches of the national economy has to do with the reflection of the composition of social production and the process of social reproduction at the present stage, and not with the reflection of the social structure from social production development in the past. Therefore it is my opinion that in revising the classification of the branches of our national economy, we should basically adopt the Eastern System, while at the same time making use of certain strongpoints in the Western method. Classification of the branches for statistical purposes should be identical to what is used for planning purposes. Both the statistical and the planning departments should put their heads together in handling problems and study in order to arrive at a satisfactory balance of the national economy.

II. How To Revise the Classification of the Branches of Our National Economy

In 1957, there were nine major branches of our national economy. In 1979, after the National Science Conference, the number of branches was increased to 10: (1) Industry; (2) Construction and material resources prospecting; (3) Agriculture, water conservancy, and meteorology; (4) Communications, transportation, and posts and telecommunications; (5) Commerce, catering, service trades, and the supply and marketing of materials; (6) Public utilities in the cities; (7) Scientific research; (8) Culture, education, public health, and social welfare (9) Banking; (10) State organs and mass organizations.

This method of classification, basically a form of the Eastern System, has the following defects:

First, the lack of a clear demarcation between material-production and nonmaterial-production sectors. For example, the service trades of nonmaterial production, the catering trades of material production, and commerce, which is a continuation of the material production process, are all included in one department. Water conservancy and meteorology in the nonmaterial-production sector, and agriculture and forestry in the material-production sector, are all included in one department. And so forth.

Second, the lack of a clear demarcation between industry and agriculture. For example, industry run by production brigades in the countryside has the characteristics of industrial production, and the vast majority of such industries have the three basic qualifications of industrial production units. Yet they are included in agriculture instead of in industry. Ocean and sea fishing are included in agriculture, although they also belong to industry. The demarcation is not clear.

Third, confusion in affiliation. Many branches of our national economy are now classified according to the nature of each social economic unit. However, according to many regulations, there are also others classified according to administrative control. Hence the confusion.

As to the revision of classification, here are my initial views:

First, all trades and professions of the national economy should be classified as either material production or nonmaterial production. There should be no confusion between them.

Second, in social production and activities, all units and their affiliated sections should be classified according to the common traits of the economic units in the social division of work, instead of the administrative systems to which these units belong.

Third, mining, lumbering, and ocean fishing, though under the category of industry, are different from processing industry. We should adopt the strongpoint of the West and classify these industries as major independent branches, instead of mixing them up with the processing industry.

Fourth, there should be a clear demarcation between industry and agriculture. Production brigade-run industries in the countryside should be under the category of industry instead of under agriculture.

Fifth, study and investigation should be conducted on each department of the nonmaterial-production sector, and the demarcation between different departments should not be too loose. At present, there is an urgent need in our country to develop housing, public utilities, daily community services, education, and scientific research. Suitable departments should be created for each of these undertakings.

Sixth, bearing in mind the above principles, we should note the old methods used in our country as well as the foreign methods of classification, while working out our new method of classification.

Based on the above views, the new method of classification of the branches of the national economy will be tentatively as follows:

A. The material-production sector will include:

1. Agriculture, forestry, and the breeding of maritime products.

2. Industry (including brigade-run industry in the countryside): (1) Mining, quarrying, and gathering of natural resources (including lumbering and ocean fishing); (2) electricity, gas, and water supply; (3) processing and manufacturing.

3. Construction.

4. Transportation, storage, and communications.

5. Commerce and catering.

6. Supply of material and technological services, marketing, and procurement.

B. The nonmaterial-production sector will include:

1. Housing, public utilities, and daily community services (including hotel business).

2. Public health, sports, and social security.

3. Education, culture, and the arts.

4. Scientific research and scientific services.

5. Credit and insurance.

6. State organs and mass organizations.

III. Demarcation Between Units According to Classification of National Economic Branches

Which social economic units should be used as the basis for classifying the branches of national economy? This should be determined by the objective of the classification.

Enterprises and establishments with independent accounting and the independent administrative units are the embodiment of social economic activities at the basic level. These units naturally become the basis for computing national income, studying the balance between consumption and accumulation, and distribution and redistribution in the national economy. Therefore, to meet the requirements for study of a national economic balance, it should be proper to take the basic-level enterprises and establishments with independent accounting and the independent administrative units as the basic units in the classification of national economic branches.

Integrated enterprises, companies, and general plants are enterprises and establishments with independent or semi-independent accounting. Therefore, they usually produce goods of different industrial categories. Large integrated enterprises, companies, and general plants are themselves large business administrative organs, and their affiliated plants, mines, enterprises, and establishments with independent accounting should be included in different national economic branches or categories according to their own characteristics. For example, mines should be included in the mining trade; chemical-industrial plants should be included in the chemical industry; cement plants should be included in the construction material industry; hospitals should be included in public health; and so forth. There are some fairly large units in integrated enterprises, companies, or general plants, and these units do not enjoy independent or semi-independent accounting. The method of classifying these units should be studied further.

Many enterprises and establishments in our country are performing the functions of social service organs, as evidenced by the appearance of mess halls, schools, medical centers, and guesthouses run by plants. How to classify these units? One way is to classify them in the same way that the enterprises or establishments to which they belong are classified, provided these units do not enjoy independent accounting. As an alternative, we can classify them as different trades and undertakings according to the nature of the social service they offer. But which is the better way? This question can be answered only after further study.

MEASURES FOR IMPROVING STATISTICAL WORK PROPOSED

Beijing TONGJI [STATISTICS] in Chinese No 2, 10 Jun 81 pp 28-30

[Article by Fu Kang [0265 1660] and Song Ying [1345 3841]: "Some Views on Doing a Good Job in Present Social Statistical Work"]

[Text] Social statistics is an important component of social economic statistics. The scope of social statistics is fairly broad, and the question as to the different fields it covers should be studied carefully. Under our present statistical system, social statistics should deal with population, family planning, the labor force, labor productivity, wages and fringe benefits, scientific research, culture, cultural relics, education, public health, publications, radiobroadcasting, sports, and the environment. To serve the policies of further economic readjustment and political stability and unity, and to facilitate the planning of economic and social development, the work of social statistics should be greatly strengthened. Based on the present statistical system, the following views are offered on how to improve social statistical work.

I

Population statistics means an enumeration of the population with details as to its composition, its geographical distribution, and its tendency to increase or decrease. These population statistics figures are an important indication of conditions in and the potential of a country, as well as an important basis for national planning on production, consumption, culture, education, and public health. For example, population figures can be used as the basis for working out per capita consumption, the average number of students in school or the [number of] hospital beds for every 10,000 people, the average amount of floorspace for the population, and so forth. Ours is a socialist country; every plan, policy, and measure worked out should reflect the fundamental interests of the working people, and all action and planning should be based on the fact that we have a population of nearly 1 billion. To improve the people's material and cultural life, the state should also treat the control of population growth in a planned way and as a long-term strategic task. Therefore, whether or not we can do a good job in population statistical work has a close bearing on the formulation of our plans and policies. Furthermore, ours is a populous country, and our population amounts to a quarter of the world's population. Therefore, our population figures are also a matter of concern for the whole world.

At present, our population statistics are still far short of requirements at home and abroad. That is why the Central CCP Committee and the State Council have decided to conduct a third national census. This census will be more complicated than those conducted in 1953 and 1964, and electronic computers will be required to work out the final results. There are more than 200 million households with nearly 1 billion people throughout the country. A door-to-door investigation or a complete registration of every individual will involve a tremendous amount of organization, investigation, and technical measures. Therefore it is necessary for leading organs to be set up at every level for the general census, and the statistics departments and the departments concerned should pool their resources to accomplish this arduous task. First, general census organs should be set up and adequately staffed at the provincial level, with particular attention being paid to trial spots. Electronic computer centers should be quickly set up along with the training of personnel.

While conducting the general census, we should continue the careful handling of our regular work on population statistics. Along with the progress of the national economic readjustment and the work of family planning, it is particularly important for us to keep abreast of the changes in the size of our population. In compiling regular population statistics, we should particularly stress the need to seek truth from facts and to report the figures of births and deaths truthfully. We must not exaggerate the achievement of family planning by falsifying reports on the number of births. In the present population report forms, the methods for computing certain items, such as the method to distinguish the agricultural from the nonagricultural population, are not quite rational. They should be further revised after research.

II

Statistics on labor power mainly include the number of employed and unemployed people in society. Laborers are the creators of social wealth, and a comprehensive, timely, and accurate report on the number of employed and unemployed people in society constitutes important data for the state in working out its labor policy and in formulating and studying its labor planning. Statistics in this aspect are particularly important during the present national economic readjustment, for the following reasons:

1. We have a large population and very rich manpower resources. Despite the great achievement in providing jobs over the past 4 years, there are still many people in 1981 who are awaiting employment in the cities, in addition to the school graduates and the soldiers returning to civilian life. The task of placement is therefore still very arduous. Further economic readjustment in 1981 calls for the drastic curtailment of capital construction projects and the "closure, suspension, amalgamation, and conversion" of some enterprises; a number of workers and staff members have to be relocated, thus adding to the burden of placement. That is why the leadership at various levels requests the statistics departments to supply regular and timely information on the question of employment and its development.

2. Both socialist and capitalist societies like to see a certain ratio in the distribution of labor and the means of production among the different branches of the national economy. For more than 10 years, the distribution of the labor force has been largely affected by an irrational economic structure, and thus it has not been able to be carried out in a planned and proportionate way according to the

objective requirements of socialist production. This has resulted in disharmony in the composition of the labor force among different departments and within each department. This has to a certain extent adversely affected the development of agriculture and light industry and the improvement of living conditions of the urban and rural population, and has given rise to overstaffing in some trades and undertakings and a lack of personnel to attend to certain jobs in others. To meet the requirements of the four modernizations, the party and state are now actively carrying out a further readjustment of the economic structure, in addition to providing jobs for many people. There will be great changes in the distribution of the labor force among different localities, between cities and the countryside and the different systems of ownership as well as among different sectors of the national economy. It will be necessary for us to report and study these changes and the inherent problems in good time.

3. Of the nearly 1 billion people in our country, some 800 million are living in the countryside, with some 300 million engaged in agriculture. Along with the natural growth of the rural population, and particularly with the transformation of agricultural techniques and the implementation of various economic policies in the countryside, more of the labor force will gradually be displaced from agricultural production. Our party has attached great importance to this matter and has introduced policies and measures for developing multiple undertakings in the countryside and for selectively building small towns. The agricultural labor force will then gradually be shifted to nonagricultural undertakings as an inevitable trend. As a prerequisite, however, there must be sufficient manpower left and a large increase in labor productivity for agriculture. Therefore, the question as to when, under what conditions, on what scale, and at what speed this shift should take place must be carefully studied, with the aid of prompt statistical information.

We have already set up separate systems of monthly, quarterly, and annual reports on the number of workers and staff members in units owned by the whole people and by the collectives in cities as well as units of other economic systems, in addition to the system of annual reports among the people's communes in the countryside. Furthermore, labor departments have compiled quarterly statistics on the disposition of people awaiting jobs in the cities and towns. Now, on the basis of highly informative statistics on various types of professional manpower, we should further improve statistics on the comprehensive balance of the labor force and provide facilities for the trial compilation of a balance sheet for labor and its distribution, to be used in studying the use and potential of the social labor force. This will keep us informed of the utilization and distribution of workers between productive and nonproductive departments, within each department, and among various districts, urban and rural areas, and the different systems of ownership. At the same time, prompt reports should be made periodically, particularly as to the increase or decrease of workers and staff members under the systems of ownership by the whole people and by the collectives, in order to help with investigations into the implementation of labor planning and to reflect the increase in job opportunities. It is also necessary to carefully study the placement of workers and staff members of enterprises that have been closed, suspended, amalgamated, and converted in the current year and to find out how work in this connection has progressed, what has become of these workers and staff members, and how their wages are being paid. We should also study the utilization of the labor force in existing enterprises and the economic results. If possible, we should conduct more typical investigations to keep ourselves informed of any problems in the disposition of manpower and of the influx of labor from the countryside into the cities.

Labor force statistics are broad in scope and involve many factors, complex standards, and important policy issues. There are still many problems, such as the absence of a complete system and reliance on only a single statistical method, which should be studied and solved. The present inconsistency between our tasks and our capabilities should be readjusted as soon as possible.

III

The main indexes of statistics on wages and fringe benefits are the total wage fund, the total amount of labor insurance benefits, and the average wage. The total wage fund is the main source of income for workers and staff members, while labor insurance benefits are a supplement to wages. Both are important components of national income and consumption. Average wage is an important means of measuring the standard of living of different types of workers within a certain period among different departments, areas, and systems of ownership. The purpose of developing production in a socialist country is to continually improve the people's material and cultural life, and statistical data on wages and fringe benefits can reflect the main aspect of the workers' material and cultural life. Hence the importance of this type of statistics.

In recent years, the party and state have attached great importance to improving the people's living conditions; there were two large-scale wage readjustments in 1977 and 1979, along with a restoration of the piecework wage system, rewards, and subsidies in some areas. Experiments have also been carried out in the expansion of decisionmaking power for the enterprises, whereby business results of enterprises are tied to the economic benefits of individual workers and staff members. At an earlier stage, however, some departments and units onesidedly stressed the role of material incentives at the expense of ideological education. Their lavish payment of bonuses and subsidies increased government spending and brought about increased deficits. The party and state are now continuing to readjust the ratio between accumulation and consumption and between production and livelihood. While stepping up political and ideological work, they have also set fairly distinct policy limits as the criterion for offering rewards. This will be of great assistance to the implementation of the wage plan, the exercise of supervision, and the conducting of investigations with the aid of statistics. Although a system of periodical reports and annual reports has been set up for statistics on wages and fringe benefits, the reported figures are not quite accurate, and analysis of this subject is still not adequate. To strengthen such statistical work, we must first stress the need for accurate figures, especially the figures on rewards. According to sample investigations conducted recently in various localities, the omission of rewards in reports has been quite prevalent. The reasons have been deliberate omissions in some units and the incompetence of statistics personnel in enforcing a strict system in others. All departments and areas should carefully note the causes of the omissions, take the necessary measures to rectify the situation, and then step up their analytical study. Improvement of the people's livelihood should be based on the development of production and the rise of labor productivity. It is particularly necessary that improvements in livelihood should be commensurate with increases of consumer goods. The whole country should carefully analyze the increase of wage and fringe benefit expenses, the rise of labor productivity, and the relationship between increased national income and increased national consumption. In analyzing rewards, enterprises should pay attention to the relationship between increases in rewards and increases in production and profits, and the relationship between rewards and standard wages. Increases in wages and fringe benefits must be consistent with production increases. However, good production in one enterprise (department or area) is inseparable from support from various quarters. An increase in wages and fringe benefits in one enterprise (department or area) should be carried out in consideration of the overall situation, and particularly in consideration of the relationship with its neighbors, instead of as an isolated locality. Therefore we must analyze and compare the wages of different departments, areas and units of different systems of ownership and various types of workers and staff members. We should also study the relationship between wages in terms of money and the index of workers' living expenses; this will reflect the actual improvement in workers' living conditions.

IV

In addition to the above, social statistics also includes statistics on scientific research, culture, cultural relics, education, public health, publications, radio-broadcasting, sports, and the environment--all of which should be strengthened. First, the scientific and cultural level of the whole nation must be raised before the state can accomplish its modernization. In striving for the four modernizations, there must be a large number of scientific, technological, and managerial personnel, and all of them must be both Red and expert. It is thus necessary to promote scientific research, culture, education, broadcasting, television, and publications. Secondly, in raising the standard of cultural life and in fostering spiritual civilization so that people of all nationalities, under the leadership of the party and the government, will be united as one and strive for the four modernizations with renewed spirit, we must likewise promote culture, education, public health, sports, and other similar undertakings. Therefore, in addition to a long-range plan for social development, the state should also work out long-range plans for economic development. Although the national economy is now undergoing readjustment and the capital construction front is being shortened, scientific research, culture, education, and so forth should still be developed, if this is at all possible. In order to work out a long-range plan for social development, we should strengthen statistical work in this respect so as to reflect the general situation and bring to light specific problems in the readjustment and development of scientific research, culture, education, and so forth.

Statistics on scientific research, culture, education, public health, and similar aspects should be carried out with the aid of relevant departments under the State Council. A certain foundation has already been laid, although the development is uneven. Some statistics, such as environmental statistics, are still in an early stage, and afforts should be made to further strengthen them. Some statistical figures are not quite accurate, the classification of certain standards is not scientifically rational, and analytical work has not been sufficiently popularized. The statistical departments should be thoroughly familiar with these problems and help the departments in charge solve them. They should join the comrades of the departments in charge in making use of comprehensive statistical data in combination with certain sampling and typical data obtained after investigations, and start their analytical study. At present, stress should be laid on the need to reflect the readjustment and development of scientific research, culture, education, and public health, as well as the problems of opening more avenues for schooling, reforming the structure of secondary education, training workers and staff members regularly, strengthening the ranks of scientific and technical workers, and improving public health in the countryside.

The standards for social statistics have different contents and features of their own, but they are all closely interrelated. While strengthening social statistics, we should also see to it that the classification of statistical standards is consistent with the methods of computation. We should also begin the study of overall balance, so that social statistics will play an even more important role.

CALL FOR EFFORTS TO MAINTAIN FINANCIAL BALANCE IN YUNNAN

Kunming YUNNAN RIBAO in Chinese 15 Aug 81 p 1

[Article by correspondents Wang Yongdian [3769 3057 3329] and Wang Zhidong [3769 1807 2639]: "Provincial Financial Work Conference Called on All Localities To Create More Sources of Revenue and To Close Loopholes in an Effort To Achieve Financial Balance in the Province"]

[Text] Actively create sources of revenue, energetically close all loopholes, and achieve a financial balance for the current year--these were the central topics discussed in the recent provincial financial work conference.

The conference held that in order to increase revenue and curtail expenditures in the province this year, the following tasks must be carefully attended to:

We should actively create sources of revenue and strive to increase both production and income. Great efforts must be made to support and promote multiple undertakings in agriculture and to develop the production of industrial consumer goods. Particular attention should be paid to cured tobacco, cigarettes, sugar, wine, tea, and the other cash crops and industrial products that have a strong impact on the revenue of the province. At the same time, there should be no relaxation of efforts on other nonessential sources as long as they can bring profits and revenue in the form of taxes.

Control over taxation and the financing of enterprises should be strengthened, and all forms of "evasion, falsification, leakage, and omission" must be resolutely stopped. Some enterprises, departments, and units have added to their production costs at will or have raised the ceiling on their spending have indulged in extravagance and waste, and "eat out of the same pot" without any regard for economic accounting. Some of them have even resorted to fraudulent means of tax evasion, or have unscrupulously used funds which should have been handed over to the state as profits. All of these loopholes must be closed. This action will not only add to the state revenue but will also correct unhealthy tendencies in the economic sphere and help carry forward the party's glorious traditions and workstyle. Taxation and finance departments at all levels should assist the enterprises and units in streamlining their financial control, in keeping to the financial system, and in upholding financial and economic discipline as important tasks for the second half of this year.

The principle of attempting only the possible and avoiding overcommitment in financial matters must be upheld, and all expenditures must be strictly controlled. All items not included in the budget should be carefully checked at all levels, so that no reduction of revenue or increase in expenditures can be overlooked. The funds provided for in the budget should be promptly handed down to the basic-level units for their use. There should be no withholding of any portion or delay in forwarding at any level, since this may lead to the loss of good opportunities for the funds to produce the desired effects.

We should continue to implement all policies and adopt all measures that may help the economic readjustment. In the past 2 years, various economic policies which have been proved to be effective in financial circles--such as the experiments with expanded financial power for the enterprises, retention or sharing of profits by enterprises, their responsibility for profits and losses, their retention (or sharing) of surplus profits (or savings from reduced losses), responsibility for expenses for administrative establishments and the retention of surpluses, rewards for the practice of economy, and so forth--should be continued with unswerving determination. We should continually sum up our experiences in the course of implementing these policies, so that these policies can be continually improved.

The conference pointed out that the maintenance of a financial balance for the province this year is a fairly arduous task which calls for a great deal of effort. We must have a firm grip on all types of work and lose no time. There are only 5 months left in this year. We must check on the results of our implementation of these policies every 10 days and every month, bring problems to light, and promptly solve them in an effort to increase our income and make better use of our funds.

BRIEFS

XINJIANG TAXATION WORK--According to statistics compiled by 11 prefectures, autonomous prefectures and municipalities in Xinjiang region, by the end of July, some 6.85 million yuan of taxes in arrears had been discovered and some 1.53 million yuan had been recovered and paid into the national treasury. In the eight counties in Changji Hui Autonomous Prefecture, 91 tax evasion cases have been discovered, and taxes evaded which amounted to some 11,000 yuan have been recovered. The great majority of counties and municipalities in the region has now basically completed inspection of tax evasion and taxes in arrears. [Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 28 Aug 81 HK]

ZHEJIANG CONSTRUCTION BANK--Since 1972 the Zhejiang Construction Bank has extended loans totaling more than 88.8 million yuan to 393 enterprises for the specific purpose of developing production of export industrial products. As of the end of August this year 338 construction projects had been completed and put into operation, increasing output value by more than 548 million yuan annually and foreign exchange earnings by more than U.S. $146.9 million annually. LIAONING POWER LINE--A 500,000-volt extra-high tension power line, the first of its kind built with Chinese-produced equipment, was put into operation in mid-September in Liaoning Province after 2 years of construction. The 159-kilometer long power line links Jinzhou in the west with Liaoyang in the east, crossing the Dalinghe, Liaohe, Huihe and Taizihe Rivers and Yiwulu Mountain. It has 372 pylons weighing over 15,000 tons. Compared with 220,000-volt power lines currently used in the province, the new power line will increase the power supply capacity by 5 times, reduce electricity loss by 80 percent and conserve 40 million kwh every year. [SK261044 Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 25 Sep 81]

LIAONING COAL MINING CONSTRUCTION--Liaoning Province has made new progress in coal mining capital construction in 1981. Eight mines with a designed annual capacity of 9.9 million tons are under construction. Shenyang colliery's No 1 (Hengyang) pit with a designed annual capacity of 900,000 tons is about to be put into production. INDUSTRY

SHANGHAI METALLURGICAL INDUSTRY OPERATIONS EXAMINED

HK240554 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 8, 15 Aug 81 pp 20-23

[Article by Duan Wensheng [3008 2429 3932] and Liu Xingli [0491 5281 0448] of the Investigation and Research Office of the Metallurgical Industry: "How the Shanghai Metallurgical Industry Manages To Decrease Output Without Decreasing Profits"]

[Text] The Shanghai Metallurgical Industry, which comprises 47 production units and over 150,000 staff and workers, has practiced the retention of a certain percentage of profits within the enterprise units since 1979. They no longer request capital construction investments from the state and have decided to promote production through their own efforts by improving the economic effects of the existing enterprises. Compared with 1978, steel production increased in 1979 and 1980 by 650,000 tons, rolled steel by 890,000 tons, while profits increased by 1.695 billion yuan and the total output value by 6.85 billion yuan. At the same time, quality was improved, varieties increased, and consumption lowered, thus 385,000 tons of standard coal was saved. In the past 2 years, the enterprises only retained 8.3 percent of the realized profits for the production development fund, welfare fund and award fund for themselves; and submitted the remaining 91.7 percent to the state. The amount of profits they turned over to the state in the past 2 years is equivalent to 5 and 1/2 years average profits for the whole industry in the 30 years since the founding of the people's republic. Compared with 1978, the profits made by the Shanghai Light Industry Bureau in 1979 increased by 4.5 percent, the profits made by the Textile Bureau by 1.5 percent and that made by the Metallurgical Bureau by 18.7 percent.

As the Shanghai Metallurgical Industry is further carrying out the policy of readjustment this year, the production of steel and rolled steel will decrease respectively by 170,000 tons and 120,000 tons compared with last year. Nevertheless, profits will still be kept on the same level as, or even a little bit higher than, that of last year, that is at 1.47 billion yuan. In other words, they will manage to decrease output without decreasing profits.

1. Changing the Guiding Ideology

The discussion carried out 3 years ago on the statement that practice is the sole criterion for testing the truth was the starting point for cadres at various levels of the Shanghai Metallurgical Industry to change their guiding ideology for industry. Since over the years emphasis was only put on "taking class struggle as the key link" and "taking steel production as the key link," many enterprises used to pay attention only to the quantitative norm of production and overlooked the economic effects. How well the production norm was achieved was regarded as a political problem while economic effects were scarcely taken into consideration. In some people's minds, "taking the production of steel as the key link" was interpreted as "taking quantity as the key link."

Over the period from 1953 to 1957, the amount of profit made by the Shanghai Metallurgical Industry was raised steadily each year from 20.46 million yuan to 77.31 million yuan, an increase of over 3.6 times. Over the same period, the production of steel was raised from 134,000 tons to 490,000 tons, an increase of 3.7 times. However, with the Great Leap Forward and the vigorous promotion of the production of iron and steel in 1958, the originally adopted guiding ideology which attached equal importance to both quality and quantity was relinquished and the established situation of steady growth and fair economic effects was confused. Compared with 1957, the production of steel in 1959 was raised by 3.3 times whereas profits decreased by 2.2 times. The whole industry suffered a deficit for 3 consecutive years.

Take the Shanghai No 1 Steel Plant for example. In 1957, the plant had 2,748 staff and workers. After the Great Leap Forward in 1958, the number of staff and workers was raised to 16,611 by the end of 1959, a growth of 6 times, and the production of steel also increased by 1.9 times. However, profit decreased by 53 times, and the plant suffered a deficit of 13.59 million yuan in the same year. The loss over 4 consecutive years accumulated to 450 million yuan. After a 3-year readjustment, the production of steel rose and profit also rose. In 1965, a profit of 83.5 million yuan was made, an increase of 96 percent over the best year before the Great Leap Forward. Production decreased as soon as the "Cultural Revolution" began. The output of steel amounted to 1.04 million tons in 1966 and it dropped to 0.86 million tons in 1969, a decrease of 17 percent; while profit decreased from 70 million yuan to 30 million yuan, a decrease of 57 percent.

The fluctuation of the steel production shown above has explained well that taking quantity as the key link and onesidedly seeking a high production norm was an integral factor in the metallurgical industry's bad economic effects and its failing to readjust the internal imbalance in time over the years.

In the discussion concerning the criterion for testing the truth, the 600-odd cadres of the CCP committee of the Metallurgical Bureau and organizations under the CCP committees in enterprises in Shanghai have turned their pondering and discussions to these problems. They put forth an idea of realizing four changes in both ideology and actions following the readjustment of the national economy. The changes are the guiding ideology must be changed from "taking class struggle as they key link" to taking production as the central task; the method of enterprise management must be changed from solely relying on administrative means to doing jobs according to economic laws; the organizing and directing of production must be changed from only paying attention to quantity and output to stressing variety, quality and economic effects; and in operating style, by attaching appropriate importance to agriculture, light industry and heavy industry, the metallurgical industry must be changed to actively and initiatively serving associated industries and satisfying social needs.

[HK240558] 2. Readjusting the Internal Imbalance

Over the past 30 years, the Shanghai Metallurgical Industry made great contributions to economic construction in Shanghai and throughout the country. However, the "congenital deficient" condition which led to an internal imbalance has existed for a long period of time and has yet to be solved. Such a situation is reflected in a concentrated manner in four problems. First, the blooming capacity lags behind that of steel smelting. The capacity of formed steel production for the whole trade has reached 5 million tons whereas the blooming capacity still remains at 4.25 million tons, 750,000 tons short. Second, the various work procedures are not matched. Although there are 1 million tons of domestic produced steel which need to undergo heat treatment annually, the available heat treatment capacity is at present only 800,000 tons. Third, investment in the nonferrous metallurgical industry for the last 30 years only amounted to 9 percent of the total investment in the whole industry. This has affected the growth in the quantity and variety of nonferrous metal products. Fourth, welfare facilities such as housing for staff and workers remain far behind the actual needs. According to statistics for 1978, out of 123,000 staff and worker households in the whole metallurgical industry the average housing area per person in 11,000 households was under 2.5 square meters.

In the past, we relied entirely on the fund allocation from the state in raising the funds for readjusting the internal imbalance. Such a practice could not change the overall situation although we did contribute a small amount every year. From 1980 on, the production development fund raised from the retained above quota profits made by the enterprises were utilized to solve the internal imbalance stage by stage, group by group, step by step and in a planned way, and therefore the latent power of existing equipment was brought into play. According to the overall plan worked out at the end of 1979, 50 key projects were preliminarily planned to be started in the next 5 years. Some of these projects were completed last year and commenced operation. Last year, 10 million yuan was drawn from the welfare fund raised from the retained profits, and used to build 80,000 square meters of staff and worker housing, of which 50,000 square meters were completed and occupied within the year. In order to expand the blooming capacity, and give full play to the latent power of equipment, a continuous casting machine and a flying shear were newly installed and a 630-model bloomer was reconditioned last year. After the expansion of the blooming and continuous casting capacities, the Shanghai Metallurgical Industry can now consume all the steel it produces and even accepts some small processing orders from outside the municipality. The money expended on technological measures for promoting the nonferrous metallurgical industry also increased from 4.75 million yuan in 1978 to 15.4 million yuan in 1980 and amounted to 31.3 percent of the total expenses of technological measures of that year. Meanwhile, the heat-treatment capacity for rolled steel also rose from 800,000 tons in the last few years to nearly 1 million tons.

The Shanghai Iron Alloy Plant was built during the Great Leap Forward in 1958. It started as a scrap steel handling plant with less than 200 workers. Today, this plant can make a profit of 25 million yuan a year. There were 4,000 staff and workers in the plant at the end of 1980. However, the bath place for the staff and workers, a temporary bathhouse which was designed to be used by less than 200 staff and workers, was not enlarged for over 20 years. Last year, this plant spent 4 million yuan of the retained profit to improve parts of the old productive equipment and build a new bathhouse and some dormitories which amounted to 3,000 square meters. In the Shanghai No 1 Steel Plant which had a production capacity of 400,000 tons, because the capacity of the continuous casting machine, which provided blanks, was insufficient, the mangles in the steel plate workshop could not work to their full capacity and the development of steel production was hampered. Last year, after a new continuous casting machine was installed, the yearly output of steel plate rose by 30,000 tons and the steel production capacity potential has also been liberated.

3. Improving Economic Effects

On the national metallurgical front, the Shanghai Metallurgical Industry is one which is operated comparatively well. It leads in achieving most of the economic and technological targets. In the 10 years from 1971 to 1980, its output value and profits have been higher than the average level of the key iron and steel enterprises throughout the country, except in 1973, when their achievement was unsatisfactory. At present, they can produce more than 1,300 types of steel, and rolled steel to more than 20,000 specifications. The precision alloy steel they produced in 1978 amounted to 31 percent of the whole country's output that year, while that of silicon steel plate amounted to 50 percent, and those of welding rod steel, compound steel for farm implements, steel material for window frames and high pressure oil pipes amounted to around 90 percent.

Having already achieved such a high level,in which ways can they improve economic effects? Should they request more investment from the state to start new projects, introduce new equipment and increase the production capacity? Or should they rely upon improving the existing enterprise efficiency, in lowering consumption, minimizing waste and expanding the production capacity? Focusing their attention based on the present conditions, the cadres of the Shanghai Metallurgical Industry put forth a scheme for retaining increased profit for the whole trade, which aims at vigorously promoting production and creating more wealth for the state. They took as the base the profit value realized in 1978 when the highest levels achieved in the history of eight economic and technological norms were surpassed. [HK240602] Every year 60 percent of the increase in profits over 1978 is to be turned over to the state, and the other 40 percent is to be retained by the trade for use as production development funds, welfare funds and award funds. This scheme is to be followed for 5 years, during which no request will be made to the state for capital construction investment.

The profit retention scheme was approved by the state and went into effect in 1979. The requirement to unremittingly raise the profit norm has pushed ahead the strengthening of those basic tasks such as the production administration planning, financial management, technological management of enterprises, and so on.

Starting from the second half of 1979, the Shanghai No 3 Steel Plant carried out an overall reorganization of the 2,217 types of records in the whole plant, including documents, vouchers, accounts and report forms, among which 1,670 were retained, 154 were improved, 393 were canceled and 146 were newly established. After the reorganization, the 1,970 kinds of records which are currently used, are accurate and reliable and manage to reflect the situation promptly and provide precise information for decision making and improving economic effects. Hence, in 1980 the production of rolled steel was raised by 5.9 percent and the profit by 20.3 percent over 1979, with only little change in product type and specifications.

In order to improve economic effects, assessments were made at all levels from bureaus to plants, workshops, teams and groups. Starting with economization, costs were lowered, profit rates raised, and retained profits increased. Thus the funds for tapping latent power, innovating and restructuring were obtained. After having set up the consumption fixing account, expenses restructuring account and economization reclamation account, the 69 production teams in the first workshop of the Shanghai No 5 Steel Plant managed to calculate all figures before smelting steel, for example, what materials are needed for smelting a furnace of steel, how much scrap steel is needed, how many kilowatt-hours of electricity will be consumed, how much alloy material has to be added, and so on. The workers in the material supplying section in the Shanghai No 2 Steel Plant have found 35 ways to economize and have therefore managed to increase profits by 1.60 million yuan for the year. Over a long period, in the No 3 workshop of the Shanghai No 8 Steel Plant, steel ingots were marked with two label plates showing the furnace number. Each year this consumed 19 tons of thin steel plates which cost 40,000 yuan. Now they use only one plate which is half as large as the original one and therefore they manage to save about 24,000 yuan a year.

In order to increase profits, they tried hard to improve the quality of products and increase the production of products in short supply. According to an assessment made in April 1979, in contrast to the 70 percent at the end of the previous year, the proportion of the products of the whole industry which were classed as fine and class A products was raised to 86 percent. The proportion for iron and steel products was raised from 72 percent to 85 percent and that for nonferrous products from 68 percent to 89 percent. Out of the eight categories of products produced in the Xinhu Steel Plant in 1979, four categories were graded as class A and the other four categories graded as fine. In 1980, the number of products graded as class A products was reduced to two, while the number graded as fine products was increased to six. This year, with the number of categories of products produced in the whole factory increased from 8 to 10, the factory is striving to raise the level of all categories of products to the fine grade. The production of those products in short supply urgently demanded by the market, such as thin plates, seamless steel tubes, silicon steel plates and high grade wire rods have been increased by 10 percent compared with April and January 1979. In order to improve the quality of rolled steel, the Shanghai No 3 Steel Plant coined a slogan of the "three unsatisfied's" for their own products. First, unsatisfied with the state standard, they required themselves to further satisfy the needs of consumers.

Second, unsatisfied with the present reject rate, they decided to further improve the quality of rolled steel. Third, unsatisfied with the surface quality of the steel, they strove to meet higher mechanical specifications. Since 1978, the production of rolled steel has been increased every year while norms have been raised, and requirements become more and more strict. At the same time, the amount of waste products have been reduced and the number of products rejected amounted to only 0.2 percent in 1980.

The Shanghai Metallurgical Industry made profits of 1.345 billion yuan in 1979, and in 1980 made profits of 1.47 billion yuan. These figures are 20 percent and 31.2 percent higher respectively than that of the previous record. This fact shows that economic effect is the key factor which affects all the links of the internal management of enterprises. Once this key factor is grasped, all links will be mobilized.

4. Taking a New Path

The path the Shanghai Metallurgical Industry has taken in the last 2 years is different from that taken during the 10 years of turbulence and not entirely the same as that taken prior to the "Cultural Revolution." It has shown in many ways that the metallurgical industry is seeking to develop a new path.

(1) The Trend of Fluctuation in Major Norms

In contrast to 1978, the Shanghai Metallurgical Industry system in 1980 achieved an increase of 10.4 percent in steel production, 14.4 percent in rolled steel production, a decrease of 9.5 percent in the amount of energy consumed in producing steel, an increase of 31.2 percent in profits and a growth of 8.2 percent in total output value. [HK280606] These figures show that the increase in rolled steel production has been higher than that of steel production; the growth of profits has been greater than the growth of total output value; and on top of this, energy consumption has been reduced. Other figures reflecting the production situation of enterprises basically followed this trend too. In 1980, the Shanghai No 3 Steel Plant which has over many years achieved comparatively higher economic norms, achieved an increase of 17 percent over 1978 in steel production, 18.9 percent in rolled steel production, a decrease of 14.9 percent in the amount of energy consumed for producing steel, an increase of 29.7 percent in profits, and a growth of 19.1 percent in the total output value. In the same year, the Xinfu Steel Plant, which only produces rolled steel, achieved an increase of 18.5 percent over 1978 in rolled steel production, 107.8 percent in profits and a decrease of 14.6 percent in energy consumption.

(2) Changes in the Profit Structure Over the Past 3 Years

Of the profit increase in 1978, 77 percent was attributed to the increase in production and product variety, 23 percent was attributed to the lowering of the consumption of materials and of costs. Of the profit increase in 1979, 49.6 percent was attributed to the increase in production and product variety, 50.4 percent was due to the lowering of the consumption of materials and of costs. Of the profit increase in 1980, 47 percent was attributed to the increase in production and product variety and 53 percent was due to the lowering of the consumption of materials and of costs. The changing trend shows that the profit proportion attributed to the increases in production and product variety is decreasing year after year, while the proportion achieved through strengthening business management and improving some processes which consume more energy is increasing.

(3) An Analysis of the Investment Direction of Production Development Fund

In the 2 years of 1979 and 1980, with the approval of the departments concerned, the Shanghai Metallurgical Industry system utilized the production development fund, which had been set up with 50 million yuan of the retained profits, to facilitate 120 measures of small-scale latent power tapping, innovation and restructuring, which had already been started or were going to be carried out, in 24 enterprises. Of these measures, 26 percent was aimed at improving quality, increasing product variety and promoting production of products in short supply; 36 percent was aimed at lowering consumption and saving energy; 12.5 percent was for coping with the "three wastes"; 12 percent was aimed at improving auxiliary facilities and amplifying equipment to form a complete set, and 4 percent was aimed at improving the cultural and educational facilities for staff and workers. The allocation of the production development fund shows that most of the fund has been utilized to improve the quality of products, to lower costs and to eliminate pollution.

By analyzing the increase in production norms, the ways of making profit and the investment direction of the fund in the last 2 to 3 years in the Shanghai Metallurgical Industry system, the following conclusion can be drawn. In expanding production, enterprises have set the focus of their attention on the existing equipment and their own staff and workers and they have set up a fund, needed for production expansion, by improving the economic effects of the existing enterprises. This is exactly the path which suits our national conditions and leads to bright prospects.

BRIEFS

FUJIAN INDUSTRY, TRANSPORT CONFERENCE--The Fujian Provincial Industry and Transport Work Conference, which was called by the provincial people's government on 14 September, concluded in Fuzhou 18 September. The conference called on all industry and transport workers to go all out to work for 100 days in order to fulfill this year's production plans. At the plenary session on 18 September leading comrades of the provincial CCP committee Xiang Nan and (Cheng Xu) made important speeches on combating lax and weak leadership to speed up the industrial and transport production. In his closing speech Vice Governor Wang Yan urged the participants to transmit the conference's guidelines to the industrial and transport front as quickly as possible. Attending the plenary session on 18 September were provincial party and government leaders Guo Chao, (Wen Xiushan), Zhang Yi, Wen Fushan and comrades of prefectural, municipal and county departments concerned, totalling some 1,000 persons. ECONOMIC READJUSTMENT MAKING GOOD HEADWAY IN YUNNAN

Kunming YUNNAN RIBAO in Chinese 11 Aug 81 p 1

[Article: "Yunnan Achieves Success in National Economic Readjustment in First Half of 1981, Although Certain Economic Problems Still Need Solution"]

[Text] Through conscientious implementation of the central government's policy on readjusting and stabilizing the economy, our province has basically maintained financial and credit balances as well as stability of commodity prices in the market.

The situation of agricultural production is fine, thanks to the implementation of economic policies in the countryside, and particularly the gradual development and perfection of the system of responsibility for production. The output of late autumn crops is basically the same as last year's, but that of rapeseeds has increased by 480,000 dan, exceeding that of 1965--the highest in history--by 57,200 dan. The acreage of early spring grain and economic crops has been expanded, and the quality of field management has shown improvement. Despite certain new problems and difficulties arising from the readjustment, industrial production has begun to develop harmoniously. Industrial output value has increased this year over that of the same period in 1980, and light industry, prefecture- and country-run industries, and production of consumer goods have developed fairly well. Output of cigarettes, radio sets, TV sets, sewing machines, chemical fiber, and dacron has increased by a fairly wide margin. Sugar output has hit an alltime high. The scale of capital construction has been further reduced and the orientation of investments has been adjusted with the result that appropriations for nonproductive construction have been raised from 31.6 to 35.6 percent. Local financial revenue has been increased and expenditures reduced. The purchase quota of treasury bonds has been overfulfilled, and savings deposits in both urban and rural areas are greater than those of the same period of last year. In commerce, finance, and trade, reforms have been carried out to suit the requirements of the readjustment, and the procurement of agricultural and sideline products has increased by a wide margin. Industrial goods for daily use have shown a marked increase; the market in both urban and rural areas is flourishing; and country fair prices, basically stable, have been reduced slightly.

However, a heavy task of readjustment is still confronting us in the province. The progress of reform and consolidation has been slow, and the cycle of national economy is still not quite harmonious. Industrial growth also has been slow. In the first half of this year, the output value of industry under the system of collective ownership in the cities and the countryside declined by 2 percent, and that of machinery, chemical industry, coal, and the second light industry has also been lower. These unfavorable economic results have a direct impact on revenue. Since 70 percent of heavy industry is owned by provincial enterprises, only 5 percent of the provincial revenue plan for the first half of this year has been collected, and the revenue in this period is 96.6 percent less than that of the same period in 1980. The revenue for all enterprises in the province also declined by 39.3 percent below that of the same period in 1980; the profit actually made was less than the budgeted amount by 17.5 percent; the amount of profits handed over to the state dropped by 16.2 percent; and the amount of losses increased by 16 percent. The control of currency issuance and withdrawal is far from ideal. In the countryside, the net issuance increased by 20.7 percent over that of the same period of last year, and the payment of bonuses exceeded the planned amount by 11.3 percent. The scale of capital construction still tends to enlarge. Compared with the same period of 1980, enterprise management expenses have increased by 10.1 percent. The people's purchasing power has increased by 37.8 percent. There is a large discrepancy between the supply of commodities and the purchasing power. Thus the supply of goods wanted by the people is short of the demand.

In view of this situation and of the problems, the provincial party committee has called on all economic departments at the provincial level to conscientiously study and implement the spirit of the Sixth Plenum of the 11th Party Central Committee, and to take realistic and effective measures to improve their work in order to ensure the all-round fulfillment or overfulfillment of the national economic plan for the current year.

GENERAL

RESPONSIBILITY SYSTEM SUCCESSFUL IN COMMUNICATIONS SECTOR

Guangzhou GUANGZHOU RIBAO in Chinese 20 Aug 81 p 1

[Article: "Various Forms of Economic Responsibility Adopted in Industrial-Communications Sector of Guangzhou; Remarkable Economic Result from Workers' High Morale"]

[Text] Since 1980, a number of trades and enterprises of the industrial-communications sector have adopted the system of economic responsibility in various forms. Arrangements have also been made for this purpose between different levels, from bureaus down to companies and plants in some trades, and from plants down to workshops, work groups, and individuals in some enterprises. This system of economic responsibility has shown remarkable results.

In addition to retention of profits and other minor changes in the enterprises, following the expansion of their decisionmaking power, the industrial-communications sector in Guangzhou has adopted the following forms of responsibility:

1. Assuming responsibility for profits and losses and paying taxes instead of handing over profits by enterprises owned by the whole people. There are now three experimental units of this type in the municipality: The Sewing Machine Industry Company, the Bicycle Industry Company, and the Spun Hemp Textile Mill. This responsibility system became popular after the expansion of decisionmaking power. Instead of handing over profits to the state, these units are now paying enterprise income taxes and drawing wage funds, production development funds, fringe benefit funds, and bonus funds at the established rates. Since this means even greater decisionmaking power, the economic results of the enterprises concerned are even better than those of units without such privileges. In the first 5 months of this year, the total output value of these three experimental units was 16 percent higher than that of the same period in 1980. Their profits and income tax increased by 88 percent and 23.9 percent, respectively. From the second half of 1980, when this system was first adopted, to June 1981, the Spun Hemp Mill made a profit of 16.4 million yuan, more than doubling the amount in the period from July 1979 to June 1980. The profits retained for developing production amounted to 3 million yuan—eight times that of the same period, or double the total amount of state investments in the 15 years following the expansion of the mill in 1964. The mill is now capable of setting up its long-hoped-for automatic production line. Bonus and fringe benefit funds have also been increased by a wide margin.

2. Responsibility by an entire trade (or all enterprises) for profits and losses, whereby profits will be retained but losses will not be made good by the state. Since assuming responsibility for profits and losses last year, and thereby turning losses into profits, the Metallurgical Bureau this year has adopted the system of retaining all the profits and requiring no state compensation for any losses. The bureau entered into contracts in various forms with the enterprises and further improved the economic results. Its output value in the first half of this year increased by 5 percent over the same period of last year, and its profits totaled more than 12 million yuan, double those of the same period of 1980.

3. Profit-sharing by an entire trade (or all enterprises). This method was used by 44 enterprises in the industrial-communications sector of the municipality. The textile trade has all along carried out regular production with a large profit base. Increased production in this trade was somewhat difficult. After the adoption of this method, however, its profit increased by a wide margin. Last year, it made a profit of more than 108 million yuan, an increase of 61 percent over 1980. In the first half of 1981, its profit amounted to more than 65 million yuan, and after deducting the portions used as bonus and fringe benefits, its net increase was still 16.84 million yuan more than during the same period last year. The rate of increase was 34.8 percent. This method was adopted by eight enterprises without expanded decisionmaking power in the metallurgical trade, including the Tantalum-Niobium Smelting Plant, and the majority of them overfulfilled their profit quotas in the first half-year.

4. Responsibility by an entire trade (or all enterprises of the trade) for profit quotas, providing for the sharing or retention of above-quota profits. The Light Industry Bureau, the Second Light Industry Bureau, and the Electronics Bureau have recently adopted this system--and will continue to keep it for 3 years. These bureaus are now working on plans and measures for increasing production and income in an effort to gain better economic results.

5. Responsibility for reducing losses to a certain level. Under this system, excessive losses will not be made up by the state but if losses are kept below a set level, part of the savings thus gained will be retained by the enterprise. A number of enterprises of the metallurgical trade dealing in steel, alloy steel, and powder metallurgy used to suffer great losses. After adopting this system, they soon reduced the losses by a wide margin, and some of them even turned losses into profits. Last year, for example, a powder metallurgy plant adopted this system, whereby it could retain 20 percent of the amount saved from losses and 30 percent of the profits gained. This plant took the initiative of calling on more than 110 counties to solicit business, and production greatly increased. Its loss the previous year of 590,000 yuan was now turned into a profit of 10,000 yuan. Thus, by reducing its loss and then making a profit, it gained 120,000 yuan.

6. Subsidy for losses up to a set level for an entire trade. The Coal Bureau recently granted, on an experimental basis, a subsidy of 31 yuan for the sale of each ton of coal. Any profit from such sales will be retained by the enterprises, to be used for the tapping of potential and for the renovation and transformation of equipment, and partly for fringe benefits and bonuses.

7. Responsibility for profits and losses by collective enterprises with independent accounting. This year, 176 enterprises under the Second Light Industry Bureau have adopted this method, which is different from the former method of sharing profits and losses collectively. In the distribution of profits after payment of taxes, the bureau keeps 70 percent, to be divided among the enterprises, and hands over the remaining 30 percent to the department in charge. The enterprises' share consists of the base and the extra share. The base share should remain unchanged for 3 years. Under this system, the output value of these 176 enterprises in the first half of the year increased by 11 percent and profits increased by 13.7 percent over those of the same period last year. In the same trade, 30 collective enterprises have not yet adopted this system, and their output value in the first half of the year increased by only 2.5 percent, while their profits dropped by 73.5 percent.

8. Responsibility for output and production costs. This is a type of general agreement between the enterprises and workshops and their affiliated sections. This agreement can take many forms. For example, the Sulphuric Acid Plant offered rewards for quota fulfillment, while the reward from the Copper Materials Plant is based on the economic responsibility of "three guarantees"--meaning guaranteed output, quality, and production costs. Many units have practiced the system of responsibility for production costs with quick results. By means of the "three guarantees" system, the Copper Materials Plant increased its output value by 24.9 percent and more than doubled its profit in the first half of this year.

BRIEFS

GUANGXI HOUSEHOLD REGISTRATION CONFERENCE--On the evening of 28 August, the Guangxi Regional People's Government held a telephone conference on tidying up household registration work. Regional people's government Vice Chairman Shi Qingsheng spoke, demanding that people's governments at all levels strengthen leadership over household registration work. Rural household registration work must be started before September and household registration work in the majority of prefectures must be completed before November. Under the unified leadership of the people's government, public security, civil affairs, labor, grain, commerce, planned parenthood and census departments must make concerted efforts to do this work well. [HK221456 Nanning Guangxi Regional Service in Mandarin 1100 GMT 30 Aug 81 HK]

JIANGSU QUALITY CONTROL--A mass campaign on quality control is in full swing among enterprises in Jiangsu. The number of industrial and transport enterprises enforcing total quality control has reached 1,126. The 6,202 quality control groups active among these enterprises have helped them raise product quality and economic results and promote production. To further popularize quality control, the provincial economic committee and provincial office for defense industry held a meeting in Lianyunggang City, 4-9 September, to exchange experience in quality control and commend advanced groups in quality work. [OW211305 Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 18 Sep 81 OW]

SICHUAN PREFECTURE SMALL CARS--Organs at the prefectural and county levels in Wenjiang Prefecture and their subordinate units have privately approved the purchase of small cars and privately engaged in the purchase of small cars, neither of which is included in the state plan. They have also privately arranged gasoline supply. In view of this, the Sichuan Provincial People's Government issued a circular to criticize them for the unauthorized purchase of small cars. In 1980, they bought 260 small cars, which is the total number of small cars bought over the previous 30 years. As a result, they have wasted a large amount of funds and aggravated the situation of the short supplies of energy resources. Small cars are a special commodity which must be controlled by the state according to its plan. They can only be allocated in accordance with the state plan and cannot be bought and sold privately. Of the 260 small cars bought in 1980, only 58 were covered by allocations to departments by the state and the remainder were bought privately. [HK221414 Chengdu Sichuan Provincial Service in Mandarin 2300 GMT 29 Aug 81 HK]

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

FUJIAN ECONOMIC ACHIEVEMENTS OUTLINED

Fuzhou FUJIAN RIBAO in Chinese 28 Aug 81 p 3

[Article by Xin Shimin [2946 1102 2404] and Gu Deqi [7357 1795 3823]: "Correctly Recognize Fujian's Economic Achievements."]

[Text] In the 32 years since the founding of the People's Republic of China, under the leadership of the Party, our Fujian Province has made enormous achievements in socialist transformation and socialist construction. It is evidence of the superiority of the socialist system and a foundation for our continuing advancement.

Fujian's important achievements in socialist construction in the past 32 years are: First of all, the victorious completion of the socialist transformation of the ownership of the means of production and the basic realization of public ownership of the means of production. We established and developed a socialist economy making the socialist publically owned economy absolutely dominant in the entire national economy. In 1979 the proportion of gross value of production of Fujian's agriculture was: Nationally owned units--state farms, forest, animal husbandry and fish farms--made up 2.72 percent, various forms of collectively-owned economies made up 78.5 percent. These two occupied 80.77 percent, the other 19.23 percent being sdeline production of commune member households. Second, industry, agriculture and other sectors of the national economy had a certain material and technical foundation. In 1952 the original value of fixed assets in Fujian waws about 30 million yuan. By 1980, Fujian's investment in capital construction was 10.3 billion yuan and newly increased fixed asets in various sectors of the national economy was 6.8 billion yuan. Of this, the original value of fixed assets in state owned industry had already reached 4.960 billion yuan which is a 165-fold increase relative to the early post liberation period. In agriculture in 1980 the area of fields irrigated was over 13 million mu and the area ensured of stable yields in spite of drought or excessive rains was 6.28 million mu. Before liberation, the rural areas were almost entirely without agricultural machinery, chemical fertilizers and electricity, but by 1980 they already had over 70,000 tractors (overall), 680,000 horsepower in irrigation machinery, used 1.8 million tons of chemical fertilizer, and rural electricity consumption had increased to 640 million kwh. Third, there were clear increases in the output and productivity of material production sections of industry, agriculture and communications and transportation. Comparing 1980 with 1952, food grain output increased from 7.4 million jin to 16 million jin, which is more than double; output of oil crops of peanuts, sesame seeds and rapsseed increased from 1.97 million dan to over 2.63 million dan, an increase of over 30 percent; output of sugarcane increased to over 60 million dan which is a five-fold increase over 1952; numbers of live pigs on hand increased to 6.87 million, an increase of 3.36 million over 1952. Raw coal increased from 3,000 tons into 4.63 million tons, output of electricity increased from 12 million kwh to 4.9 billion kwh an over 400-fold increase. By 1980, industries that came into being were: Steel, output to 240,000 tons, cement, to 1.55 million tons, chemical fertilizers to over 1 million tons and 130,000 sewing machines, over 27,000 bicycles, 23,900 tons of cotton and silk, and over 13,500 tons of chemical fibers. After liberation railways were constructed, air routes were opened, highway transportation was developed and communication and transportation increased. Fourth, there were great increases in the province in science and technology, culture and education and in public health. For the past 30 or more years, Fujian has trained nearly 70,000 university, college and graduate students, the number of institutions of higher learning have increased from 9 to 16 and the number of college and university, middle-level vocational school, regular secondary school and elementary school students has increased several tens of times over; a group of scientific and technical research sections have been established and by the end of 1979 there were more than 100,000 natural science and technological personnel in the province. Finally, the people's standard of living has clearly improved. In 1980, Fujian workers' average salary was 703 yuan, of which the state-owned workers' average salary had more than doubled over 1952. According to analytical estimates from relevant sections, in 1979, the net income each commune member received from the collective and his individual enterprise was over 140 yuan, which is a 1.3-fold increase over the 60 plus yuan received in 1950. Discounting for price inflation , the standard of living of the people of Fujian has clearly improved.

Fujian's achievements in economic construction in the past 32 years are not only something with which old China could not compare, but would be outstanding in a world-wide survey. Of course, Fujian's path of economic construction has not been a smooth one. The first eight years the economy recovered and expanded very quickly and in the period 1952-1957, gross value of industrial and agricultural production increased by 10.4 percent annually, and the average wage of employees in state-owned enterprises increased 36 percent. However, after this, due to a long period of "leftist"ideological influence, things were not done strictly according to objective laws, in the guiding direction there was a desire for quick results and in strategic targets there was an impetuous advance which created a proportional imbalance in the national economy, the economic structure was irrational and economic results could not be improved. But seen overall, comparing the achievements and shortcomings in Fujian's economic work in the 32 years since the founding of the People's Republic of China, the achievements are still important. Of course, if there had not been these mistakes, Fujian's economic construction could have made even greater achievements. If we further carry out the readjustment direction and proceed from the situation in Fujian, walk a new road of low investment and good results, people can really benefit and Fujian's economy can improve as fast as it can.

The conditions for Fujian's economic development are superior, the central authorities have adopted special policies and flexible measures for Fujian, so if we lack confidence in Fujian's modernization, there will be no grounds for pessimism and disappointment. But hoping for quick victories, and thinking that we can work wonders in a short period of time is also unrealistic. We should have lofty aspirations and high ideals and revolutionary enthusiasm, as well as do what we are capable of, proceed in an orderly way and gradually and analytically realize the Four Modernizations.

NATIONAL POLICY AND ISSUES

ECONOMIC ISSUES IN FIRST HALF OF 1981 REVIEWED

Beijing GUANGMING RIBAO in Chinese 6 Sep 81 p 3

[Article by Dong Fureng [5516 6534 4356]: "Commentary on Certain Questions in Economics in the First Half of the Year."]

[Text] In the first half of the year China's economists have deliberated certain questions and we would now like to comment briefly on deliberations concerning several of these questions.

I. The Strategy of China's Economic and Social Development

Since the beginning of the year, economic circles, economists and science and technology circles in the capital, with the collective support of some units, have held three conferences on the strategy of economic and social development and discussed the strategy of China's economic and social development. The discussion has been based on examining China's past strategy of development, in comparing the strategy of devlopment of other countries, and has taken as its point of departure the general mission of realizing in the Four Modernizations.

Up to now, the deliberations have tended to emphasize the question of the strategy of development of China's economy and society. During the deliberations, everyone has discussed the negative consequences brought on by China making national industrialization, rapid economic growth and increases in certain goods (such as steel) the targets of development strategy for a long time and proposed making the people's basic needs the target of development strategy. Related to this, they also proposed the question of short-, medium- and long-range targets for China's socialist modernization, including in particular the specific content of the "comfortable society" to be achieved by the end of the century. People also have a rather uniform understanding of the targets of devlopment strategy necessary to change China, i.e., shifting the targets of development strategy to satisfying the people's basic needs. However, there has been no in-depth discussion of the specific content of the people's basic needs and the indicators of the stages (especially, the end of this century) of socialist modernization.

The development strategy of China's agriculture received rather more attention in the deliberations. This is not only because of the important role which agriculture plays in the goals of the development strategy of satisfying the basic needs of the people, but also because the widespread implementation of systems of responsibility, which link emuneration to production, has presented a series of new problems to China's agricultural modernization.

Formulations of strategy for economic and social development must be geared to China's basic national conditions. The in-depth study of national conditions has already begun to receive serious attention from a variety of areas. However, to study national conditions in-depth from the perspective of the need to formulate strategy of development still requires a great deal of work.

Seen from the perspective of the present situation, the discussion of the question of economic and social development strategy has far from really started. Many questions have either barely been touched or not at all touched, for example, a solution to the excess of agricultural population, the disparity and trends in income between strata and resident collectives in the economy, the choice of an import-export strategy, the choice of a technology policy, the utilization of foreign capital, etc. It can be expected that these questions will attract more economists to participate in the discussion and that more research results will emerge.

Because of differences in social systems, different developing countries should have different development strategies, but developing countries also have many common problems which must be resolved, therefore, in development strategy there are places where they can borrow from each other. This has important significance as reference for comparative research on various countries' development strategies and for formulating China's development strategy, and this work is still in a very weak state. Also, in addition to the independent research we have carried on ourselves, the experience and lessons of choice of development strategy by various countries, the introduction and absorption of the useful results of developmental economics abroad is also necessary.

II. The Forms and Structures of China's Ownership of the Mean of Production

In the process of correcting the leftist guiding ideology in economic work and carrying out reform of the economic system, the forms and structures of China's ownership of the means of production are undergoing profound changes and these changes must have a far-reaching and lasting influence on China's economic development. Thus this has become a question of extraordinary concern to economists. There are many topics here for us to deliberate. The year before last, people were paying attention to city and town collective ownership and this led to the convening of a conference on the theory of city and town collective ownership in January of last year. Then people turned even more attention to the forms of rural collective ownership (the question raised by implementing the various forms of the system of responsibility which links remuneration to production), the restoration and expansion of city and town individual ownership, joint-management ownership, Chinese-foreign joint capitalized ownership, etc., and the question of the structure of the ownership of the means of production at China's present stage which came from this. This led to this year's March-April forum on the question of the ownership of the means of production at China's present stage. Around the time of this conference, the press published a great many articles related to this topic.

Deliberations on the forms of socialist public ownership is a big advance for China's political economists in the theory of ownership. From many years of experience and lessons in the changes in public ownership of the means of production, people feel that socialists public ownership (whether national ownership or collective ownership) does not exist in any fixed pattern or form and that there is not any one socialist public ownership system which is suited to the circumstances of special productive forces and thus there is not any one socialist public ownership form which can forcefully promote the development of productive forces. We must find forms of socialist public ownership which are suited to different productive forces' situations. Political economy's research on the question of socialist ownership cannot stop at "generality of socialist public ownership" but must combine productive forces with further study of the forms of socialist ownership0 In recent years the broad peasants and employees have made a great many creations in this area. Workers in economic theory cannot treat these creations from the perspective of maintaining fixed patterns, but should investigate them from the perspective of theory.

People have already achieved a common view of the question of the structure of ownership of the means of production at China's present stage, which is mainly that under the condition that the socialist ownership has absolute dominance, a variety of economic elements and managerial forms can coexist. There has already been some discussion on the basis, quality, position, function and development trends of various forms of ownership and the relationship between them, but still they await in-depth study. In view of the present situation there still is not fully scientifically based proof of the level and quality of productive forces which are suited to the systems of ownership. This is inseparable from our long term overlooking of study concerning the question of productive forces. It is still not easy to overlook studying systems of ownership separately and what deserve attention in particular here is the question of the ownership system produced by agriculture after carrying out the various systems of responsibility which link rewards to production (especially after fixing farm output quotas for each household and assigning responsibility for a task until its completion, the ownership produced after state-owned enterprises in "substituting taxes for profits, independent accounting, being responsible for profit and loss" including the question of whether or not state-run enterprises can carry out responsibility for profit and loss and carry any significant responsibility for profit and loss), ownership produced by joint state-private management, etc. Ownership produced by privately collected funds and private capitalism requires even more careful treatment. Individual ownership is also a big question (such as hired labor, tax revenue) must be studied to provide a theoretical basis for formulating appropriate policy.

III. Economic Readjustment and Overall Balance of the National Economy

Since 1979 China has been carrhing out a readjustment of the economy and although some accomplishments have been made in readjustment, the anticipated goals have not been achieved and there is an enormous latent crisis in China's national economy. This year the Party and nation decided to carry out a rectification of the national economy, the short-term goal being to eliminate financial deficits and achieve a balance of revenue and expenditure; to stop financial issues and achieve a credit balance; to control inflation so that prices would maintain basic stability. Under the curcumstances for the past half year, economics and economists have had rather extensive deliberations on this question of the readjustment of the national econmy. The Conference on the Theoretical Question of the Overall Balance of the National Economy which was convened in January of this year, was held under the guidance of implementing the direction centered on readjustment.

The deliberations on this economic readjustment, apart from summarizing the lessons and experience of history, stressed an analysis of the factors which caused the present economic difficulties and created the enormous latent crisis in the economy. Discussion was conducted related to the idea that "deficits are not harmful" in an attempt to adopt deficit financing to stimulate economic development. The economic thinking of Comrade Chen Yun received serious attention in the discussion. People are once again discussing the ideas which Comrade Chen Yun proposed long ago in the late fifties concerning the balance of finance, credit and material resources and the idea that scale of construction should be suited to national power. The discussion was carried out in combination with present circumstances and this is significant. However, it should be said that there is still not much written on the question of the balance of the three and there is nothing which goes beyond the theoretical depth of the writing of the sixties.

In discussing economic readjustment, discussing a new path for developing socialist economy which is suited to China's national circumstances is very significant. This can be seen as a constituent element of the discussion on the question of development strategy of China's economy and society. Related to this question is the study of how China's economy can get out of the current predicament so it will gradually get into a better cycle. Along with the readjustment of the economy, especially contraction of the scale of capital construction, many industrial sections, especially heavy industry (particularly metallurgy and machine building) find themselves in a very serious bind. Great amounts of productive capacity have become idle, much useful goods and materials are overstocked, the pace of economic dvelopment has dropped, the activity of entire economic movements has been reduced and if we are to extricate ourselves from the present predicament, in firmly carrying out readjustment so that the economy will become active, idle productive capacity and stagnant goods and materials can be put back into the economy, still is a major problem before us which we must exert ourselves to address.

In the question of the national economy's overall balance, discussing the question of developing local superiority, balancing the local economy and coordinating the local balance and the national balance, we are farther ahead than in the sixties, but we are only beginning and need to go deeper.

IV. Reform of the Economic System

In recent years China has achieved some preliminary results in the experiment at reforming the economic system. This year we will set about the further readjustment of the national economy. Under these circumstances, the series of questions produced by the reform of the economic system must be answered theoretically. For example, how should the reform work on the economy system in the first period be evaluated? Is there a relationship between the serious difficulties which appeared in the economy and the epxeriment at reform of the economic system in the first period? How should the preliminary results in the reform of the economic system be consolidated in the period of readjustment? How should reform be conducted to benefit readjustment? How to manage the relationship of planning and the market, the relationship between centralized management by the central authorities and developing local and enterprise initiative, the relationship of the interests of the state, enterprise and employees and the relationship of the central authorities to the local areas, etc.? The Conference on the Question of Theory and Practice in Reforming the Economic Management System which was held in April of this year, discussed some of these questions. Some questions were discussed in the press. Although there has been extensive theoretical discussions of the question of reform of the economic system and there have been many breakthroughs (seen from the perspective of thought liberation), it should be admitted that there are a great many questions which await resolution in theory and in practice. Creating models which are suited to the notion of a socialist economy in China's national circumstances is still an important topic which lies before us.

This is a question concerning the general direction of the reform of China's economic system. In the new economic system, how to combine planning and the market is still a question which resuires continuing discussion. In the preliminary experiment at reforming the economic system, in the process of expanding enterprise initiative some questions have already been asked in various aspects of the reform of the economic system (such as the planning system, taxation system, pricing system, financial system, etc.). The question of reforming the various system parts of the economic system to make it a whole, still needs exploration. The question of the leadership system within enterprises has also been raised. In the period of economic readjustment, apart from consolidating existing achievements and continuing with some new experiments, because of the restrictions of subjective and objective conditions, reform of the economic system cannot be carried out comprehensively. But in this period, making conscientious theoretical preparations is absolutely necessary.

In the most recent period, with the inspiration of implementing in the countryside the system of responsibility linking rewards to production, some industrial commercial and service enterprises have begun to try out various forms of the economic responsibility system, from being responsible for profit and lost and responsible for a task until it is completed to contractural management, deserve our close attention and careful deliberation, and we need to devote particular attention and discussion to the relationship between forms of the economic responsibility systems and the future comprehensive reform of the economic system.

V. The Question of Economic Effectiveness

In correcting the leftist guiding thinking in economic work, in the process of readjusting the national economy, the question of economic effectiveness has become a question people are paying attention to and attention to economic effectiveness is an important element in the new road of economic development suited to China's national situation which we are following. The Conference on Theoretical Questions of Economic Effectiveness which was held in March of this year was held under these circumstances.

There has been continuous discussion of the question of economic effectiveness in recent years. For the past six months, in addition to continuing to summarize the historical lessons and experience in economic effectiveness, emphasis has been placed on discussion combining it with readjustment of the economy.

In the period before the 3rd Plenary Session of the 11th Meeting of the Central Committee of the CCP, new impetuous advances in economic work did enormous damage to China's economic development. People studied the question of economic effectiveness brought on by the new rash advance from the perspective of economic structure, scale of capital construction, choice of projects, use of foreign capital and importation of technology and drew the necessary lessons.

In the preliminary experiment at reform of the economic system, the lack of complete systems in the economy and reform and some incautious methods produced a problem of some sections and units only paying attention to microeconomic effectiveness and ignoring macroeconomic effectiveness. Stressing macroeconomic effectiveness and uniting it properly with microeconomic effectiveness has become a matter of great concern. There have already been some articles on this.

The question of the relationship of developing local superiority and improving the macroeconomic effectiveness of the entire economy, which appeared in the process of local areas pursuing comprehensive self-sufficiency and promoting their strengths while avoiding their weaknesses in developing local superiority must be studied.

Study of the question of economic effectiveness has always been weak. Seen in terms of the present, apart from continuing to strengthen research on basic theory related to the question of economic effectiveness it is necessary to concentrate our efforts on studying and scientifically evaluating the system of norms and indicators of economic effectiveness and correspondingly propose a complete set of integrated evaluation methods and at the same time combine it with feasible research on some topics to raise the method and theory of economic effectiveness to a new height.

In the first half of the year there have been some developments in basic theoretical questions of political economy, the question of productive labor and nonproductive labor is an example. There is research on other important questions of economic theory, but here we will not go into them one by one.

MANAGEMENT METHODS CAN IMPROVE BUSINESS ECONOMIC RESULTS

Beijing QIYE GUANLI [ENTERPRISE MANAGEMENT] in Chinese No 4, 19 Jul 81 pp 10-13

[Article by Liu Yuanzhang [0491 3293 1728], research worker at System Science Research Institute, Chinese Academy of Sciences: "Improve Business Management for Better Economic Results"]

[Text] The main purpose of the economic readjustment and restructuring now going on in our country is to improve the economic results in production, construction, and various economic spheres. An enterprise should actively take the initiative to improve its business management and strive for better economic results in meeting the requirements of the "eight-character [readjustment, restructuring, consolidation, and improvement], policy" with readjustment as the central task.

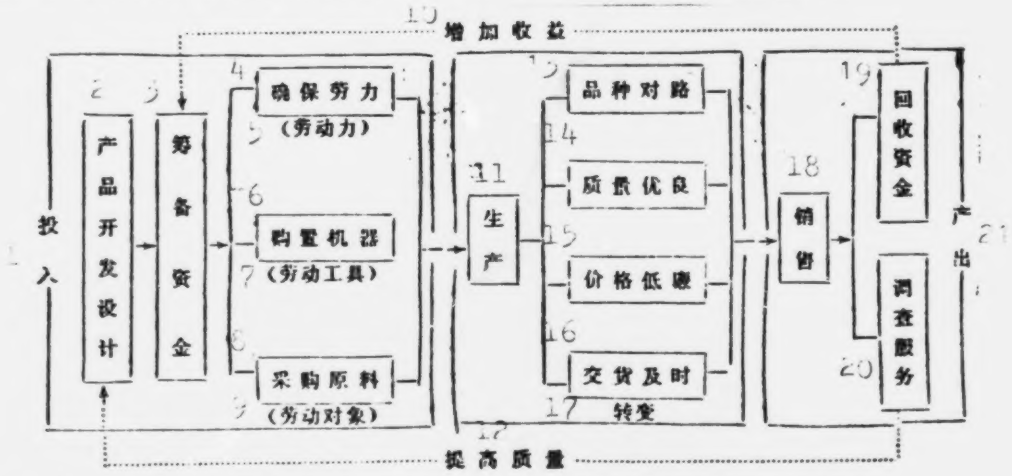
I. Implications of Economic Results

Generally speaking, all productive and business activities of an enterprise are included in the "input-conversion-output" cycle. Input (or putting in) means the investment of the required manpower, money, and materials which, after physical, chemical, or biological treatment of the mechanism of conversion, become finished products as output (or production). So-called production means the input of manpower, money and materials to be converted into finished products having newly added value from labor. These products will become commodities through circulation and be sold on the market. Their value will then be realized. The economic results of an enterprise are the proportionate relationship between input and output, as expressed by this formula: Economic results = output ÷ input. If the value of output divided by input is 1, it means that the value created by labor is sufficient to maintain simple reproduction. If the value is less than 1, it will mean that labor has been wasted and that even simple reproduction will be impossible. Therefore, the value must be greater than 1 before additional social wealth can be created, before the enterprise can carry on expanded reproduction, before the people's livelihood can be improved, and before socialist construction can be served.

Recently, the central government decided that inland enterprises should learn from their coastal, mainly Shanghai, counterparts; this decision was made as an important economic strategic policy decision for the purpose of achieving an overall improvement of economic results. Shanghai's overall economic results are actually much better than those of other places. In Shanghai, the annual output value for every 20 billion yuan's worth of fixed assets was as high as 60 billion yuan. If other factors are not taken into account, the ratio between output and input is 600/200 600/200 = 3. This 3 is the index for the measurement of economic results. In 1979, the total industrial output value in our country was 459.1 billion yuan. In 1980 it increased by 8.7 percent and amounted to 499.2 billion yuan. Rounded off to 500 billion yuan, this is about the same as the original value of fixed assets of all industrial enterprises throughout the country. In other words, if we divided the total industrial output value by the value of the total fixed assets used as input, the average economic results in the country expressed by the result can only be 1. If, however, industrial economic results throughout the country were as high as those of Shanghai, the total industrial output value for that year would have been 1.5 trillion yuan. If we add to this figure another 200 billion yuan of agricultural output value, the combined industrial and agricultural output value would be 1.7 trillion yuan, which would work out to a per capita income of 1,700 yuan, or 1,000 dollars. Then the people would be able to live in "relative comfort."

II. Relationship Between Business Management and Economic Results

How can we produce better economic results? First, we must improve the quality of enterprises. Consolidation of enterprises means improvement of their quality. Enterprises must have vitality before the national economy can flourish. If the quality of an enterprise is too poor, it can never become active, no matter how many external conditions you may create for its improvement. If, for example, a person has stomach trouble, you cannot expect him to do much work, even though you feed him with good food. If an enterprise has good quality, it will be able to increase the value in the continuous input-output cycle and add to its profits. The cycle of increasing value can be seen from the following diagram:



Key:
1. Input
2. Design for production
3. Fundraising
4. Guaranteed labor
5. Labor
6. Purchase of machinery
7. Tools of labor
8. Purchase of raw materials
9. Object of labor
10. Increased benefits
11. Production
12. Improved quality
13. Suitable products
14. Good quality
15. Low price
16. Timely delivery
17. Conversion
18. Sales
19. Return of funds
20. Service inspection
21. Output

From the above diagram, it can be seen that this type of increased value is created by labor in the process of production, and the created value can be realized only through circulation. If there is only creation but no realization, then an increase in value cannot be accomplished and economic results cannot be attained. Therefore, while on the one hand we consider methods to create value in the field of action, we should, on the other hand, realize value through circulation in the market. Both input and output, at the two ends of the diagram, are connected with the market, while the intermediate transformations all take place in the field of action. To improve economic results, we should consider the market in the light of both input and output, and [consider] the field of action in the light of the mechanism of conversion. Consideration of the market means mainly the formulation of a business strategy, or a business policy decision; consideration of the field of action means stressing management tactics, or management behavior. Strengthening the quality of enterprises in fact means stirring up business strategy ideas and increasing the power of management tactics among enterprises.

III. On Business Strategy

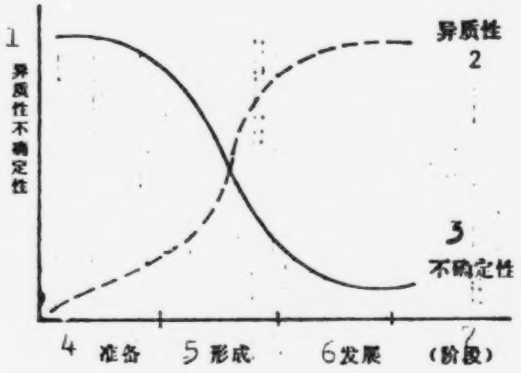
Business strategy means deciding on the long-range objectives of an enterprise and on the necessary action to be taken in attaining these objectives, in addition to working out a series of policy decisions. The work of directing enterprise activities is called basic strategy, while that of directing enterprise functions is called functional strategy. Basic strategy consists mainly of the following three types:

1. Optimum development strategy. When an enterprise is engaged in the production of many different final products or in many forms of activities, it is necessary to consider the means of distributing or utilizing the enterprise's business resources (or funds) in order to ensure optimum benefits. Therefore, it is necessary to analyze many aspects of products--such as the rate of increase of sales, the place they occupy in the market, the sequence of changes they undergo, and so forth--in order to determine the optimum plan for the distribution of business resources. This is called the optimum development strategy. The regulating conditions and target functions required for the mathematical planning in resource distribution are all decided by this type of distribution planning. Apart from the above-mentioned points, we should also consider social needs, state policies, international conditions, and other factors in deciding on the target of optimum development strategy.

2. Multiple-undertaking strategy. While the product mix and the organizational structure are being readjusted, we should consider the question of adding new varieties to the product mix. As for the organizational structure, we should consider the question of integration in various forms. The main orientations are:
1. To develop within a field that is related to the orginal market, such as development from the production of men's garments to the production and marketing of women's garments. 2. To develop production of goods with their original strongpoints into production and marketing of related goods. For example, the present diesel engines are well received by tractor-assembly plants. We should take advantage of the strongpoints of this production technique and production management to produce accessories for diesel engines, such as power generators and air compressors. By this means we will not only make better use of the original strongpoints of diesel engines but also help raise their quality and lower

production costs through the production of related goods and from information on their quality as reflected by the market. (3) To develop in the direction of serial production or raw-material and secondary-processing departments. Serial production here does not mean serialization of specifications but should include products of different types. For example, textile mills originally producing only grey can also engage in printing and dyeing; camera plants can develop the production of projectors, electronic computer equipment, and so forth. (4) To develop new products and new fields by making use of existing business resources and people's intellectual power. For example, a transistor plant can utilize its technical personnel to develop the production of goods used for solar energy.

In choosing a form of multiple-undertaking strategy, we must consider the elements of uncertainty and difference in character. There necessarily are risks for enterprises in business management caused by the element of uncertainty in enterprise activities. Difference in character means the complex nature brought about by the change from a single line of business to multiple-undertaking. Therefore, in working out a multiple-undertaking strategy, we must carefully weigh the increased effects of the difference in character and the reduction of benefits caused by the risks inherent in uncertainty, strike a balance between the two, and choose the better one. We should also consider the different stages of multiple-undertakings, as shown in the following diagram.



Key:
1. Difference of character and uncertainty
2. Difference of character
3. Uncertainty
4. Preparation
5. Formation
6. Development
7. (Stage)

3. Strategy of withdrawal and change. During the readjustment of the industrial structure, product mix, or organizational structure, a given enterprise may unavoidably be "closed, suspended, amalgamated, or converted." This calls for a full investigation and analysis. On the one hand, we should look at the enterprise itself and find out the causes, the mistakes made, and the symptoms of trouble that may have led to the need for a strategy of withdrawal and change, on the other hand,

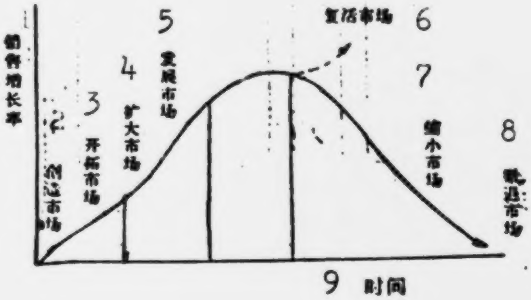
we should also look at the external factors and find out the causes and problems--such as reduced market demand; increased raw material prices; intensified sales competition, which contributes to the cutting of selling prices; slow progress of technical innovation, which weakens competitive power; surplus production, which has led to a surplus of equipment; pressure from other enterprises; the demands or policy of new production and the change to new fields; difficulties in turnover of funds; rising interest rates; and so forth. Based on an analysis of these two aspects, we can work out a strategy of withdrawal and change.

This strategy of withdrawal and change is not intended as a measure for dealing with the aftermath of business failures. On the contrary, it serves to prevent business failures. In the course of consolidation, we hope to do more in amalgamation and conversion and less in closure and suspension. In short, we must study the situation of the enterprises about to be closed or suspended and find out the various factors leading to such necessity, so that we can provide better directions in the future. We must not summarily attribute everything to the readjustment now going on.

IV. On Functional Strategy

Enterprise activities are usually carried out in several departments, and each department has its own function. These functions sometimes share a common foundation with the whole system and sometimes have special characteristics of their own. Therefore, when an enterprise already has had a general business strategy, there should still be at least a functional strategy for the principal departments. Proceeding from a desire to improve economic results, we can consider the functional strategy in relation to such matters as raising product prices, joining the scramble in the market, accelerating the turnover of funds, reducing the burden of interest payments, and lowering production costs; then we can divide the strategy into the following parts:

1. Sales strategy. Since output value has to be realized in the market, sales are therefore also in need of a strategy. There should be an assessment and analysis of the rise and decline of commodities in the market, as shown in the following diagram.



Key:
1. Rate of sales increase
2. Creation of a market
3. Pioneering in market
4. Expansion of market
5. Developing the market
6. Reactivating the market
7. Shrinking of market
8. Withdrawal from market
9. Time period

According to this analysis, different sales planning should be worked out at different times, such as plans for training salesmen, advertising in the press and broadcast media, setting up sales centers, exhibition and sales on an experimental basis, consignments, sales commission, opening up enterprises for public inspection, strengthening postsales service, and so forth. Furthermore, in conducting an analysis according to the above diagram, we should classify the goods into daily necessities, articles for daily enjoyment, daily substitute items, daily luxuries, daily indulgences, and so forth and use the rise and decline of their sales as the basis of our study. At the same time, we should also base our study on the competitive power of the enterprises themselves and adopt market sales policies accordingly. For example:

		5	6	7	8	9
		扩大	限制	缩小	转移	创造
竞争地位	强	○				○
	中		○	○	○	○
	弱		○	○		○

Key:
1. Competitive power
2. Strong
3. Medium
4. Weak
5. Expand
6. Restrict
7. Reduce
8. Change
9. Create

For any type of commodity and any type of market, a sales strategy should ultimately be based on the following marketable goods of fine quality; smooth marketing channels; aggressive salesmanship, and rational sales prices. Therefore, a sales strategy is possible only with the support of the departments concerned.

2. Production strategy. This only means complete rationality, elimination of waste, lowering of consumption of raw materials and energy, and cutting of production costs in every possible way. This should be considered in the light of the following factors:

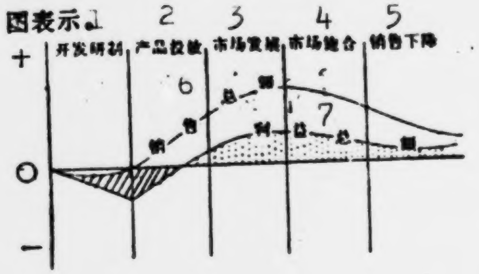
(1) Plan for lowering production costs. This is based on the basic business strategy. During the design stage, a shortcut to the lowering of production costs can be worked out on blueprints. At present, if the QC [quality control] groups now being formed throughout the country will pay attention to development in the direction of the design department, they will provide a more effective way to success. At the same time, utilizing leftovers as a rational way to conserve resources, lowering labor expenses by raising output, increasing work efficiency by changing product design and processing methods, changing raw materials as a means of reducing energy consumption, strengthening or improving the use of tools, repairing and lubricating as a means of indirectly reducing material consumption, and comprehensively utilizing various experimental materials and supplies for official business and so forth are all important ways to reduce production costs.

(2) Equipment investment plan. Instead of relying on the importation of new equipment, we should give play to the role and efficiency of our existing equipment. Before investing in new equipment, we should consider the balance of capacities in the work sequence and the suitability of the scope of production, and then compare the usefulness of all-purpose machines with that of special machines. We should also consider the extent of automation and other factors, all of which should be carefully attended to at present.

(3) Reduce reserves as much as possible and adopt the "signboard" method of production. Following the great success of the Toyota Motor Vehicle Company of Japan in changing the traditional method of production management from "top-downward" to "bottom-upward," the "kanban" [signboard] production method has become a popular subject for study. Of course, coordination in various aspects is needed before this can become a success. Yet we should now at least consider changing from production on the basis of unreliable plans to production according to orders placed in the form of contracts. This will produce good results by reducing various reserves.

The most important element of a rational production strategy is participation by the entire personnel; otherwise, none of the above tasks can be accomplished. To ensure full participation, intensive political and ideological work is needed. Small group activities should be encouraged, and attention should be paid to workers' interests and welfare so that everyone will treat the plant as his own home. This is the most basic rationality.

3. Introductory strategy. Research on the introduction of new products is indispensable to the achievement of good economic results. Therefore, a whole set of jobs needs to be done, from introductory plans, design research, and the turning out of commodities to pioneering work on the market. In working out a strategy, however, we should first clearly understand the life expectancy of the products. This can be shown in the following diagram.



Key:
1. Introductory research
2. Output of products
3. Market development
4. Market saturation
5. Decline of sales
6. Total sales
7. Total benefits

In this diagram, we should note the size of the shaded area at the beginning of the "total benefits" curve from the 0 line. Attention should be paid to this factor in working out an introductory strategy. In the past we did not study this aspect, even for the capital construction of production enterprises, not to speak of the introduction of new products. Of course, this curve, like the sales curve in sales strategy, has different shapes for different groups of commodities. However, they are generally similar.

According to this strategy, enterprises are regarded as a complete system with the following special features:

First, they are affected by the environment and in turn affect the environment. This is the most striking feature of modern enterprises. An enterprise's business and its economic results are affected by the conditions of market demand. However, they can also create market demand. They are affected by policies, but their development can also affect the formulation or change of policies. They are also affected by the social concept of value, but they can change the social concept of value. Finally, they can be restricted by technical conditions, but they can also create or renovate technology.

Second, among either the internal elements (manpower, money, and materials) or the external environmental elements of an enterprise, thre is always the element of uncertainty. Uncertainty is the source of risks for enterprises, but business strategy is worked out to deal with enterprise risks. An enterprise's economic results are gained by overcoming these risks.

Third, the collection and analysis of information and numerical data therefore form an indispensable basis for working out business strategies. The market investigation we usually talk about is only a means of obtaining this needed information, but market investigation itself is also one type of environmental information.

An understanding of these basic concepts is useful to the consolidation of enterprises, the reform of business management, and the improvement of economic results.

FINANCE AND BANKING

PRC JOURNAL ON MIDDLE, SHORT-TERM BANK LOANS

hK040004 Beijing JINGJI YANJIU in Chinese No 8, 20 Aug 81 pp 24-34

[Article by Yang Peixin [2799 1014 2450] dated 20 Aug 81: "On Middle and Short-Term Bank Loans for Equipment and Installations"]

[Text] The middle and short-term bank loans extended by the People's Bank of China are new products that have emerged from the reform of our economic management and readjustment of our national economy. In October 1979, leading comrades of the party Central Committee raised the question of whether it was conceivable to change the financial appropriation system to a bank credit system, making the banks a lever for economic development and technological renovation. Banks should deal with economic problems. Instead, they are now only playing the role of making out bills and keeping the books without really playing their role. In regard to enterprises that produce quick results with little investment, we should bypass financial appropriations and take up bank loans. Many plants need only a few thousand yuan to resolve their problem; some need a few tens of thousand or a little more than 100,000 yuan. In such cases, the bank should supply them with loans. If such loans are handled with good adaptability, the banking network is going to be expanded. In fact, this proposition became true in 1979 in the experimental points for economic management reforms in Sichuan Province. With more decisionmaking power, the enterprises were able to keep part of their enterprises fund in addition to a certain amount of their depreciation fund. However, even the combination of the depreciation fund, the major overhaul fund and the development fund was not sufficient to cover the financial needs of the old enterprises in their effort to adjust to the market demand requiring improvement of product quality and varieties by taping unused potential and carrying out renovation and transformation. It was this situation that required the banks to take in the various funds of numerous enterprises in order to make middle and short-term loans for equipment and installations to enterprises in most urgent need. By the middle and short-term loans we refer to here, we mean loans of 3 to 5 years maturity for the former and less than 1 and 1/2 years maturity for the latter. At that time the comrades of the Sichuan provincial party committee issued an instruction to stop making uncompensated appropiations out of the provincial government expenses and ordered that middle and short-term loans be made instead through the People's Bank of China by reason of the bank's wide coverage in urban and rural areas by its branches and its constant and extensive contacts with the industrial and commercial community, thereby having the benefit of giving play to the economic effects of the loans. Along with this, they proposed that the banks be given the decision power in making loans and that the various departments concerned be limited to the right of making suggestions, leaving the decision on the loan, its amount and the length of its maturity to the discretion of the banks. In 1980, in order to suit the situation of readjusting the national economy the People's Bank sponsored middle and short-term loans for equipment and installation throughout the nation. The total amount of the loans was set at 5 billion yuan, 2 billion were of middle and short-term loans of general nature to be controlled by basic-level banks, and 3 billion of which were special-item loans to be ratified by the State Council in the fields of textile and light industries, electronics, communications, railways, the metallurgical industry and so on. By the end of 1980, loans outstanding amounted to 4.54 billion yuan, 1.95 billion of which fell into the category of middle and short-term loans of general nature, and 2.6 billion of which were special-item loans. Loans paid back during the current year amounted to 560 million yuan.

The issue of middle and short-term loans for equipment and installation has been much welcomed by the enterprises. Having successfully achieved its technological transformation with the aid of long and short-term loans, the Zhongnan rubber factory of Chongqing municipality presented a silk pennant which read: "We are not of the same family yet we go beyond family ties: with one heart and one mind, we strive together for the four modernizations." The leading cadres of Chengdu textile mill said: Bank loans have supported our mill in increasing production and income. It is just like using good steel at the cutting edge of the knife." The collective enterprises commended the loans as "sending charcoal in snowy weather." The leading comrades of the local party and government organs of Jiangsu Province and the departments in charge of the enterprises made the comment: "The middle and short-term loans of the People's Bank have given us a solution to the problems which we tried to solve for so many years in the past, but to no avail." On the other hand, there are also some comrades who think that the middle and short-term loans made by the People's Bank have over stretched the capital construction front, squeezed out government revenue, encouraged excessive issue of bank notes, and done damage to the principle of dual management of government funds and bank credit.

In March this year, the People's Bank of China summoned a conference in Tianjin to exchange experiences in making middle and short-term loans, and delegates from various provinces and municipalities made a preliminary review of the past and summed up the past experiences. Since practice is the sole criterion for testing truth, it is the objective facts and actual practice that we take as the context for probing the question as to what roles the middle and short-term loans have played and what problems are to be solved.

(1) The middle and short-term bank loans for equipment and installations have forcefully accelerated the readjustment of the national economy.

Short-term bank loans are not large in amount. However, they have had a strong and extensive effect on the national economic life, mainly seen in the following aspects:

1. They facilitate the rapid increase of the production of consumer goods.

The national conference of light industry departments at provincial and municipal level in March this year revealed that "making middle and short-term loans is a good way." Last year a total of 970 million yuan of loans was made to light industries, which played significant role in increasing the production of consumer goods in short supply. In the first year, success was achieved in increasing production capacity for making bicycles, sewing machines and wristwatches by 1,500,000, 90,000 and 1,000,000 units respectively. In the same year, the production of beer increased by 25,000 tons, high-quality wine by 210 million tons and leather shoes by 200,000 pairs. The conferees asked for more middle and short-term loans for this year, 500 to 600 million yuan in amount, so that 1.3 billion yuan of taxes and profits might be generated this year and an increase of production of such goods achieved to withdraw 4.2 billion yuan of currency from circulation. Shanghai Municipality planned to designate 10 factories to produce more of the "3 major consumer durables" [television sets, bicycles and wristwatches] for the light industry sector. The light industry sector of Shanghai Municipality asked for 30 million yuan of loans this year so that 1.9 billion yuan in goods might be increased in production and additional taxes and profits totalling 1.19 billion yuan might be generated. If an additional 30 million yuan of loans are made in 1982, 296 million yuan more of the 3 major consumer durables will be produced and an increase of taxes and profits of 1.19 billion yuan will be made. All these loans can be repaid in 1982.

With the help of the middle and short-term loans, rapid growth of the production of brand goods has been achieved, and a heartening prospect has emerged. The Hangzhou yellow rice wine, originally manufactured in the traditional way, attained an annual production of 8,000 tons only, which was insufficient to meet the demand of Hangzhou inhabitants and had to be supplied on a ration basis. With 134,000 yuan of equipment loans from the banks and with the backward production methods improved and production mechanized, an increase of production of 120,000 tons has been made possible. Manufacturing started in November last year, by year end output value increased by 1,080,000 yuan and taxes increased by 800,000 yuan. Now Hangzhou yellow rice wine is being supplied without rationing. Beijing beer has been in short supply, as the two breweries making it are old factories constructed before liberation with obsolete equipment and outdated production technique. With 3.3 million yuan of bank loan for the purpose of getting more storage vessels, renovating equipment and improving production technique, production can be increased by 5,000 to 10,000 tons this summer. The People's Bank also made a loan to Shunyi County brewery to reconstruct its abandoned plant and annual production is expected to be increased to 20,000 tons. The Kuandian food factory of Liaoning Province produced biscuits which were black and hard. The local inhabitants sent some of the biscuits to RENMIN RIBAO and commented that "throwing these biscuits could kill someone." A bank loan was made to the factory to purchase an infrared ray electric over. The biscuits produced there now smell wonderful and taste sweet, and production has been increased by 280 percent. In Fuxin Mongol Autonomous County of Liaoning Province, no factory for producing soybean sauce has been constructed since liberation and supply had to be provided by Shenyang intermittently. With a loan of 40,000 yuan, a soybean sauce workshop was constructed and in 1 month's time production was started with enough output to satisfy the needs of the people. In Sichuan Province, a bank loan of 140,000 yuan was made to the factory producing the Wuliangye liquor, and an increase of production of 1,000 tons was expected in order to satisfy market demand, both domestic and abroad. As indicated by statistics of Liaoning Province, of the total middle and short-term loans, one-third has been allotted for the purpose of improving product quality and increasing product varieties in order to market more high quality famous brand products.

2. It helps the enterprises divert production to marketable consumer goods, develop cooperation and accelerate readjustment.

The Changan Country pottery and porcelain factory of Shaanxi Province, a collective enterprise, had taken losses of more than 500,000 yuan in the past few years because of high costs and poor quality products and lack of markets. A decision was made by the department in charge to convert this factory into a cotton weaving mill, and a bank loan was granted to purchase 250 weaving looms, which were installed and began production in June last year. By the end of the year, 1,500,000 meters of khaki were produced with a value of 2,000,000 yuan. The mill made a profit of 50,000 yuan and provided employment to more than 500 workers who had been laid off as the result of the closure of some factories in the country. The Chongwen chemical fibre factory of Beijing, which had been producing cords for fishing nets with little sales, was merged into the second woollen sweater factory, with the result that 200 transverse machines were needed. At the beginning of last year, a bank loan of 200,000 yuan was granted to the factory and the original plant was used to install the machines to begin production. By yearend, more than 90,000 woollen sweaters were produced, increasing output value by 1,860,000 yuan and yielding 429,000 yuan in taxes and profit. The Nanshan knitting factory of Chongqing was originally a producer of quartz sand, and was converted into a producer of sleeveless vests because of insufficient sales. With a bank loan of 500,000 yuan, production lines of weaving, bleaching, dying and sewing were set up. Production began in May last year, and by yearend 170,000 good quality vests underwear were produced. With full utilization of its designed capacity, the factory can produce 400,000 pieces of clothing and supply 400,000 yuan of profit. In the case of the heavy rolling mill of Chongqing Steel Corporation, which modified abandoned equipment into 265 rolling presses to produce small construction steel products, with 70,000 yuan of its own and a bank loan of 50,000, construction began in March and production started in May last year. Some 422 tons of rolled products have been already produced, making a profit of 120,000, and the bank loan has been repaid already. It is expected that with the capacity of the pressers fully utilized, 500 tons of rolled products can be produced annually, increasing taxes and profit to 170,000 yuan.

Through the middle and short-term loans, the banks have enhanced cooperation among the enterprises in terms of specialization. With a bank loan of 6 million yuan, the Dalian bicycle factory increased its production capacity of 26-inch and 28-inch bicycles from 180,000 to 300,000. Thirteen enterprises including shipyards and heavy machinery factories were urged by the local authorities to help make equipment and provide wheel rims, cranks and other parts. The banks also joined in to provide funds. These enabled production of 26-inch bicycles to increase rapidly to 26,000.

According to the statistics of Hanzhou, Zhejiang Province, only 13 percent of the middle and short-term bank loans were used for civil engineering construction. In the case of Dandong City, Liaoning Province, the percentage is only 7 percent; in Wuhan, it was only 6 percent. Most of the loans were used for the purchase of machinery equipment. The national total of 4.2 billion yuan of middle and short-term bank loans has provided more than 3.5 billion yuan of purchasing orders for the machine-building industry, not including the funds owned by the enterprises brought along into the deals by the bank loans. This is a forceful impetus for making the machine-building industry produce for the light and textile industries and offer its services to the enterprises in tapping unused potentials and undertaking renovations. This has played a role in enlivening the machine-building industry and stopping its production decline and taxes and profits fall. Therefore, the middle and short-term bank loans have played the role of hitting two birds with one stone, not only increasing production of the light and textile industries but also enlivening the machine-building industry. This helps to break the suffocating situation and benefits the linking and normal operation of the various sectors of the national economy.

3. It supports the enterprises in every way to save energy.

Saving energy is an important strategic measure in the process of readjustment, as it is expected that the increase of energy needs caused by increased production is to be met by energy saved. To save energy, it is necessary to activate tens of thousands of enterprises and to wage a mass campaign. Through the support of bank loans, it is possible to achieve much with little money and to get comparatively great economic effects in a short span of time. By the end of February 1981, the brank bank of Shanghai had made 7 loans for energy saving, totalling 308,000 yuan. As energy-saving yields quick results, four of the loans have already been repaid. The 26th contton textile mill took a loan of 26,000 yuan for converting 8 single-speed air blowers into 3-speed blowers. The transformation was completed in June last year, and more than 300,000 kwh of electricity were saved in 2 months. By yearend the loan was repaid with the savings in the consumption of electricity. In the case of the Shanghai solvent factory, with the increase of a 8 spiral-plate heat-exchangers, 2.5 tons of steam have been saved per hour. This means 1,200 tons of oil saved annually. The factory has already repaid the loan with savings from energy consumption. The Beijing smeltery, a producer of reclaimed copper, took a bank loan of 150,000 yuan to purchase a packing machine to press the small copper pieces into cakes. This enables the switching of multi-feeding to single feeding of the electric furnace, whose power consumption has been reduced from 200 to 110 kwn per ton of copper smelted, and coal consumption in earthen furnaces has been reduced from 290 kilograms to 273. Last year, 280,000 kilowatt hours of electricity and 54 tons of coal were saved, and 60 more tons of copper ingots were produced. Taxes and profit were also increased by 250,000 yuan. The Nanhai sugar refinery of Guangdong Province, by taking a bank loan of 1 million yuan, completed its project of electric generation by residual heat and started operation before the sugar refining season. In the past, 740,000 kwh of electricity were required from a major power brid. Now the factory has enough electricity for its production and household consumption. In addition to these, 340,000 kwh of electricity are supplied to a major power station. Some 9,000 tons of coal are saved annually and profit has increased by 470,000 yuan. With the completion and operation of the power generation project by residual heat in 5 sugar refinery factories, it is expected that 30 million kwh of electricity will be added and 32,000 tons of coal saved. The vacuum flash factory of Hangzhou originally had 3 oil burning boilers, consuming 2,700 tons of oil annually. In August last year, a bank loan of 300,000 was granted to the factory to convert the boilers into coal-burners. Operation began in December. Not only has oil consumption stopped, but expenses are also reduced by 210,000 yuan annually. The Hangzhou brewery had 3 Lancashire boilers, notorious coal gluttons. With a bank loan of 75,000 yuan, the boilers were modified into fast-feeding boilers, which saved 155 tons of coal monthly and increased output value by 400,000 yuan, and taxes and profit by 100,000 yuan. The Jingshan boiler subsidiary equipment factory of Hubei Province, a producer of boiler ash cleaners, took a bank loan of 125,000 yuan and purchased 5 important pieces of equipment. Production has been increased to 1,600 cleaners to be supplied to 320 purchasers throughout the country, capable of saving 181,000 tons of coal for the state and increasing electricity generation by 4.1 billion kwh. The rate of certified products for these cleaners has been raised from 55 to 98 percent. Output has been raised by 150 percent, costs reduced by 44 percent, and net profit increased by 490 percent. In 10 months' time, the loan was repaid in full. The Chongqing branch of the People's Bank, in its operation of loans for small hydro-electric generation sponsored by Sichuan Province, granted a loan of 1.2 million yuan in support of the Qijiang hydroelectric station. In July last year, 32,240 kwh of electricity were produced and the needs of local industrial and agricultural production were met. The total loans for small hydroelectric generation construction in the nation as a whole amounted to 240 million yuan. Some 160 projects were completed during the year, adding 280 million kwh of power generation.

4. It gives support to communications, transportation and the tourist trade, and increases export and employment.

Transport and communications comprise a weak link in our national economy at present. They should be the sectors to be developed and strengthened in the process of readjustment. Through the operation of middle and short-term loans, the banks have accelerated the development of transportation and communications. As Zhejiang is a coastal province, it has vast coastal waters and many seaports and abounds in waterways and river networks, enjoying predominance in water transport. Despite all this, these, in 1979 6 million of cargo shipments were left undelivered. The same unfavorable status was also found in the old age of shipping vessels and serious waste in energy consumption. While the combined output capacity of the 38 shipyards of the province amounts to 45,000 tons, the annual target for production was only 29,000 tons last year, only 65 percent of capacity. The fact that concrete boats have a 40.2 percent deadweight ratio against their load capacity and the age of the wooden vessels surpasses 30 years indicates the necessity of renewal and transformation. Last year, loans granted by banks to the water transport businesses in the province totaled 1 million yuan for constructing 152 vessles. This added 18,000 tons of construction assignments to the shipyards, bringing their operation in basic terms to full capacity as well as rendering help in cleaning 5,212 tons of steel products and some machine and electric products in stock. "Suffocation" in three areas has been relieved.

Loans have been also granted to Hangzhou tourism, services, food and beverage and cultural businesses by the bank. A bank loan of 30,000 yuan has been granted to the city gardening company in support of its business in constructing fish ponds and breeding gold fish. Its operation increased income by $40,000 due to export of its products, and raised profit by 30,000 yuan. Loans have been also granted to the garden and woods travelling service company for the purpose of purchasing sightseeing buses, and constructing mountain villas for toursits, thus integrating food, lodging, transportation and entertainment into a whole. A bank loan of 290,000 yuan has been granted to the Leshan and Emei mountain tourist district of Sichuan Province for the purpose of four sightseeing buses and two yachts. Tourists can take the buses from the city right up to Emei mountain, and cruise on the yacht to enjoy the sight of the Dafo monastery and the Wulong monastry. A loan has also been granted insupport of purchasing mobile cabins for Emei mountain and an additional 340 beds so that tourists may stay on the golden summit overnight and enjoy the sight of sun rising in a sea of clouds next morning.

Bank loans are also extended to give play to the local predominating trade and promote exports. Zhejiang Province is well known abroad for its laces and arts and handicraft articles. These are labor-intensive products, mainly made by handiwork of village women and of collective enterprises. They had difficulty in development for lack of funds in the past. The mountain climbing shoes made by Leqing industrial arts shoe factory are marketed as far as the EEC and have a high rate of earning foreign exchange. However, this factory lacks equipment and its workshops are congested. With a bank loan of 600,000 yuan, it expanded its production capacity from 2 to 6 million pairs of shoes. Last year, an increase of production of 2 million pairs boosted output value by 7.5 million yuan and taxes and profit by 900,000 yuan, and earned $3.4 million. Xiaoshan lace was once awarded a gold medal by the state. In November 1979, a bank loan of 200,000 yuan was granted for purchasing equipment to expand production. It took only 4 months for the project to go into production last year. Through middle and short-term bank loans, Shenjiang Province increased its foreign exchange earnings by as much as $13.9 million. Firecrackers and fireworks are traditional export products of Guangdong Province. Bank loans amounting to 800,000 yuan were awarded to Nanhai firecracker works and Nanhai Red Flag firecracker works to expand their plants. Some 12 million yuan worth of firecrackers were exported, an increase of 10.6 percent compared with the previous year. Fireworks exports increased by 19,000 boxes. This year production can be increased to 23,000 boxes, which can earn $1.46 million. The 3 sub-branches of the People's Bank in Jiangling, Honghu and Taianmen, Hubei Province, made loans amounting to 1.53 million yuan in support of enhancing production of industrial arts shoes, plastics flower and other products, which enhanced output value by 19,290,000 yuan and increased foreign exchange earnings by $11.1 million. Statistics of Shanghai and the provinces of Zhejiang, Guangdong and Hubei alone indicate that through the support of middle and short-term bank loans, foreign exchange earnings were increased by $53 million.

The support given by middle and short-term banks loans to reproduction in the enterprises implies growth of employment of young people. Bank loans amounting to 1.41 million yuan extended in support of 14 light industry and textile products in Wuchuan County of Guangdong Province increased output value by 11 million yuan and taxes and profit by 2.94 million yuan, and provided employment for 1,340 persons. Last year in Hubei Province, a total of 14.99 million yuan of loans were extended to 47 labor-intensive projects, mostly producing arts and handicraft articles, apparel, shoes, hats, leather, leather shoes and other products, and employment was provided for 9,500 persons awaiting employment. Last year in Liaoning Province 48 loan projects, totalling 22 million yuan, for the No 2 light industry system provided employment to 20,000 young people awaiting employment.

As indicated by the facts mentioned above, middle and short-term bank loans have played an important part in the readjustment of our national economy. Leftist mistakes bogged down the national economy in a vicious circle, giving undue emphasis to the development of heavy industry, setting high targets and requiring large-scale capital construction. Thus led to financial deficits and over-issue of currency, and had unfavorable impact on the market as well as on prices. This disabled our country financially in further developing the energy and communication industries, in making more investment in the light and textile industry as well as in providing more employment for young people awaiting employment. After more than 1 year's experience, by now we are beginning to see a new road whereby despite the financial difficulties of our country we can develop production of consumer goods and the light and textile industries at a comparatively rapid speed, save energy by various ways in order to develop our communication and transportation industries, make the machine-building industry shift to the track of serving the light and textile industries, enhancing production of consumer goods and rendering service to the export industry as well as helping industries to divert to other production and to cooperation by specialization, increasing employment, government revenues and commodity supply, withdrawing currency from circulation, and extricating the national economy from its vicious circle and setting it in motion in a healthy cycle. In this respect, the middle and short-term bank loans for equipment in installations comprise one of the important economic levers by which our country can rid itself of the economic difficulties and transform the vicious cycle into a healthy one. In 1980, output value of light industries of Liaoning Province increased by 3.6 billion yuan, 700 million of which were created by middle and short-term bank loans, 19.5 percent of the newly-increased output value. The percentage for the city of Dandong was 20.8 percent, for Jinzhou, 26.1 percent, and for Fuxin 33.5 percent. In Shandong Province, of its increased industrial output value in 1980, 22.4 percent was facilitated by 47.4 percent for Shouguang County in 1979, and the percentage increased to 56 percent for the period January-September 1980. The middle and short-term bank loans for equipment and installations by steps have gained an important position in facilitating enhancement of production of light and textile industry as well as in readjusting the proportions of our national economy. Such loans are becoming an important part of treading a new road for the development of our economy.

(2) The middle and short-term bank loans have provided a new approach for enhancing investment results.

By replacing government appropriations for fixed capital investments with bank loans, the middle and short-term loans made by the People's Bank have effectively enhanced investment results.

Our capital construction investment results were inefficient in the past. From 1952 to 1978, 60 billion yuan of capital construction investments were made, only 40 billion of which however actually took the form of fixed capital assets. From 1952 to 1979, 35 billion yuan of industrial investments were made. In the same period, taxes and profit collected amounted to 86 billion yuan. By and large, investments were redeemed in 10 years. The length of investment redemption is much longer than in Japan and the United States. Aside from this, there is the tendency for investment efficiency to decrease by degrees. As indicated by calculations of the first ministry of machine-building, the length of time of investment redemption was 3 and 1/2 years in 1st 5-year plan and 7 and 1/2 years in the 3d 5 year plan, and there has not been a single redemption for investment projects since 1970.

Despite the fact that the operation of middle and short-term bank loans has been carried on for only a little more than 1 year, a road has been trodden leading to better investment results. As indicated by the statistics of the first light industry bureau of Liaoning Province, 39.39 million yuan worth of middle and short-term bank loans can generate 180 million yuan of new output value, 42 million yuan of taxes and 29 million yuan of profit. In 7 months' time, the loans will be repaid in full. The investment result may be stated as follows: each yuan of equipment and installation loans generates 12.7 yuan of output value annually, and add 2 yuan to the state accumulation. This means that the time span for investment redemption runs from 6 to 8 months.

Why then do the middle and short-term bank loans yield comparatively better results? This is so because the loans are used for tapping unused potentials and undertaking reforms and transformation of the old enterprises, making full use of the original plants, installations and equipment, technological force and management organs. At present, many old enterprises are characterized by low economic efficiency, high consumption of energy and raw materials, poor product quality, high costs, low profit rate, and slow turnover of funds. One important reason for this is the slow renewal and transformation of fixed assets and the lack of decisionmaking power for renewing and transforming equipment on the part of the enterprises. Little funds have been devoted to the transformation of old enterprises. Let us take the textile industry of Changzhou, Jiangsu Province, as an example. During the period 1949 to 1978, 2.05 billion yuan were accumulated for the state. For the same period only 16 million yuan of investment were made by the state. This total value of fixed assets in 1978 amounted to 139 million yuan. As stipulated, there was only a retained share of 2.8 million yuan which could be used for renewal and transformation. This was just enough for tinkering here and there, and patching up just to get by. Many renovation programs had to remain untouched. This of course shackled the development of production and improvement of technology. Since the fixed assets of an enterprise wear out bit by bit and the compensation fund is also drawn bit by bit, there is the process of drawing out by stages and putting it to use in combination. Hence comes the situation where many enterprises draw their funds for later use, keeping the funds temporarily idle while other enterprises want to put the funds to use before the withdrawals, and require an advance. All these spell the necessity of the banks' involvement in the process of technological renovation of the enterprises, as well as their function in regulating funds in the field of fixed capital. The banks' issue of middle and short-term loans marks the beginning of such involvement. As indicated by the investigation undertaken by the textile bureau of Shandong Province in respect to bank loans last year, it was found that investment can be saved more than 50 percent in tapping unused potential, undertaking reforms and transformation, and time for construction can be reduced more than 1 year in comparison with new construction. For example, by making use of the plant originally owned by a tractor factory, the second dyeing and weaving factory of Yantai City completed in less than 1 year a trimming and clearing line capable of producing 10 million meters of polyester fabric annually, reducing civil construction by 4,300 square meters and saving investment by half. In the case of Liaoning Province, generally speaking, the middle and short-term bank loans averaged 100,000 yuan per project last year, and the turnover of the loans took less than 1 year. Each yuan of loans for equipment and installations generated 5 yuan of output value and provided 1.56 yuan for state accumulation, whereas in the case of newly constructed enterprises, the turnover of the loan took 2 of 3 years and each yuan of the loans generated 2.5 yuan of output value and 70 cents of taxes annually. Through a bank loan of 550,000 yuan, the Shenyang City Brewery increased beer production by 6,000 tons. A new brewery producing 5,000 tons of beer annually would require an investment of 5 million yuan and would take more than 2 years to build. Over the years, in the first light industry system Zhejiang Province, the ratio of capital investment to new output value has been found to be 1:4, while that for the second light industry system has been found to be 1:7. In the case of equipment and installation bank loans, the ratio has been 1:11, surpassing capital investments in efficiency by 100 percent. All these facts prove the validity of the resolution made by the party Central Committee and the State Council regarding the replacement of government appropriations for capital construction investment by bank loans in the years to come. These facts also vindicate what the leading cadres of the State Council have in their mind: namely, instead of setting up new outfits everywhere, we should mainly depend on the existing enterprises tapping unused potential and undertaking renovation and transformation in the years to come.

The following factors may be mentioned as regards why the middle and short-term bank loans yield comparatively better investment results:

1. Under the guidance of the party committees of various levels, and with cooperation between various departments and the banks, macro-analyses and micro-investigation have been combined, and attention has been paid to both overall balancing and to keeping to the terms required by the loans, thus making the economic results of the loans a certainty. Issuing middle and short-term bank loans gives rise to involvements to various aspects of the national economy: the overall balancing taken by the State Planning Commission, the planning in tapping unused potential and undertaking renovation and transformation done by the State Economic Commission, the allocation of construction supplies and work force under the charge of the State Capital Construction Commission, the ordering of equiopment by departments in charge, state revenues of the government divisions, profits, materials provided by various supply departments and the handling of the three wastes under the charge of the environmental protection departments. Consequently, close cooperation is required among the various departments to make analyses in product design, source of raw materials, size of construction, economic effects and so on. In the meantime, assurance must be given to the loan decisionmaking power of the banks, and full responsibility must be given to the credit officer of the banks at the basic level to check on the conditions of construction and production, the economic effects after production and the ability to repay, and to refuse loans to those who do not meet the requirements, in order to effectively resist blind and duplicate construction. We should strengthen the leadership of the party and the government, and give play to the banks in their capacity as economic organizations. It is the combination of the two that brings the loans into conformity with objective reality and gives us better loan results.

2. An early start of operation of the projects and better investment results can only be guaranteed by strengthening economic responsibility of the enterprises and arousing their initiative through the medium or bank loans as an economic lever.' The middle and short-term bank loans are different from investments supported by uncompensated state financing. The former require repayment by a definite date, and interest payment. It is exactly this which directly links with the economic interests of the enterprises and their employees, and operates either as a pressure or as a motivation force, making the enterprises follow strict budgeting and expediting construction, operation and repayment of loans. It is said in the enterprises: "Since investments from the government require no repayment, the more we have the better. In the case of bank loans which require repayment of principal and interest, we have to stick to very strict budgeting." In this way, the enterprises do their best to accelerate the progress of their projects, and to strive for going into production early in order to get the benefit early and to return the bank loans early. The Pingdu tannery of Shandong Province did not wait for the completion of its civil engineering project. Upon the arrival of its newly-arrived 18 pieces of equipment, the company installed the equipment in the old workshops and temporary work shed in order to start production earlier. By the end of last year, 150,000 pieces of leather had been produced. A total new output value of 1.44 million yuan and 210,000 yuan of profit were realized, and the bank loans were returned 1 year ahead of time.

3. Strictly stick to giving the banks the loan decisionmaking power. This gives the banks the authority to lend as well as exert pressure, and ensures that they can resist duplicate and blind construction projects as well as those that do not yield any economic results. This is the crucial link in enhancing economic efficiency.

Making the banks responsible for playing the role of regulating the national economy through the economic lever of making bank loans is a great encouragement to the bank cadres, inspiring them to take the responsibility, to challenge hardship and difficulties and participate actively and passionately in this new task. In Liaoning Province, banks of the city, county and down to the very lowest level, have generally given stress to this task, and have assigned the task to directors, section chiefs and specially appointed persons. In Jianli, Hubei Province, a responsibility system for equipment loans has been set up with specially-appointed administrative personnel. Very earnest and responsible work has been done to make micro-investigations for the loans. The Tianjin branch made a case-by-case investigation of the loan projects transmitted from their higher authority; 24 projects were found unqualified for the loans because of lack of marketability or assurance of material supply, or unsatisfactory preparatory work, and these projects were strictly barred from the loans. At the end of its investigation, the Chongqing branch canceled 23 projects for reason of duplicate and blind construction, uncertain supply of materials, competition for raw materials, inadequate supply of energy and serious pollution. On the other hand, once a loan has been approved, the banks would cast in their lot with the borrowing enterprises, pay constant attention to the progress of the project and offer their help in good time. A bank loan was awarded to the Xian hosiery knitting mill for the purchase of 40 knitting machines. According to the plan, delivery of the machines was to be made at the end of last year. The credit officer of the bank, however, asked the Shanghai offices of the bank to contact the enterprises concerned, and was successful in moving up the delivery date 5 months. By yearend, 180,000 pairs of hosiery were produced, and profits were increased by 72,000 yuan. The loan was also returned ahead of time.

4. Give full play to the predominance of the banks. There are more than 30,000 banks at the basic level, having constant contacts with 400,000 enterprises. The banks have been giving working capital loans to the enterprises and are well-informed of the conditions of the various sectors as well as of the individual enterprises. We should make use of this advantage, and combine macro- and micro-analyses to make the middle and short-term loans yield good investment results.

The financial system of our country is composed of the People's Bank of China, the Bank of Agriculture of China, the Bank of China, the People's Construction Bank of China, the Rural Credit Cooperatives and other financial organizations. These banks each have their own predominance and should be given full play in respect of their specialties. Our country has made the decision that the uncompensated government appropriations for capital construction investment will gradually be replaced by bank loans in the future, will be responsible for different tasks. Achievements have already been made in loans for small hydroelectricity generation by the Bank of Agriculture of China, in loans of foreign exchange by the Bank of China, and in loans for big and medium-scale capital construction by the People's Construction Bank of China. For the medium and short-term loans to be extended to the several hundreds of thousands of enterprises, which banks are in the best position to take the responsibility? Some comrades proposed that since the medium and short-term bank loans fall into the category of simple and expanded reproduction of fixed assets, and since the People's Construction Bank is more experienced in supervising the construction work of capital construction, is it not reasonable then to deposit the depreciation fund, the major overhaul fund and the enterprise fund of the enterprises, one and all, into the People's Construction Bank? Likewise, the medium and short-term loans should also be handled by the People's Construction Bank. If our observation is purely made in the direction of capital construction, it should be admitted that this proposal is reasonable. However, whether the medium and short-term bank loans are effective in economic results depends first of all on their conformity with the macro-analysis of the national economy as well as on the supply, production and sales condition of the enterprises, the marketability of their products, the quality of their products, source of raw material and energy and their operation and management. In these respects, the People's Bank enjoys certain predominance. The People's Bank's suborganizations have a wide coverage over the urban areas and countryside, with more than 30,000 organizations in total. It is the everyday business of these organizations to handle the incoming and outgoing routine work of deposits and remittances, and loans for working capital for every of these enterprises. Besides, it is the duty of the credit officers to analyze the production and the supply and sales conditions of every enterprise and to be familiar with the crucial points of production development of the enterprises. For example, in the case of a working capital loan to the Qingdao Second Chemical Fiber Factory which had long been overdue for repayment, the People's Bank learned that the quality of the polyamide fibers produced by this enterprise had been poor and their price rather high. Besides, the enterprise suffered from single product output, lack of sales, overstocking of products, and hence business losses. The reason for all this was found in the backwardness and incompleteness of equipment, irrational technology, and processing of semifinished products out of the province, making the cost of production more expensive. The remedy for the enterprises lay in technological renovation, the completion of equipment, and the renewal and replacement of equipment. The Qingtao local offices of the People's Bank at the basic level granted an equipment loan of 190,000 yuan to this enterprise to support its purchase of a resilience fibre machine, a pellet banking machine and other equipment, which finally led to the successful production of resilient polyamide, a new product, which achieved good marketability. Accordingly, the enterprise was able to turn losses into profits. It turns over 200,000 yuan of profit to the state and repaid every cent of the working capital loan accumulated over the years which totaled 500,000 yuan. The Xianyang shoe factory of Shaanxi Province suffered a loss in 1979 of 4,000 yuan to outdated styles of its products. A loan of 90,000 yuan was granted to the factory to purchase a rotating plastics injection machine and 9 horizontal sewing machines. With these machines put into production, production quality was improved, varieties of product increased, and the products were accepted in the international market. Last year, output value went up 125 percent, and a profit of 92,000 yuan was made. The Pingdu brewery of Shandong Province had difficulty in marketing its dried yam white wine. It thus overstayed its working capital loan. Last year, a loan of 170,000 yuan was extended to the brewery to help purchase facilities to manufacture ginger wine, which turned the local unmarketable wine and ginger into ginger wine, which was in short supply. Production began in May, and the working capital loan, 210,000 yuan in total, was repaid in October. If the problem of funds in the production process is artifically and metaphysically cut into two portions, the working capital loans and the middle and short-term loans for equipment, with the former to be operated by the People's Bank and the latter unrelated to the People's Bank, this is just like treating the head when the head aches and treating the foot when the foot hurts. It makes it very difficult to have an overall observation in order to grasp the crucial aspects for seeking a solution. Why is it that our enterprises are less efficient economically in comparison with those of the advanced foreign countries, and that the working capital tied up is much larger in volume that that of those countries? This has much to do with the obsoleteness of equipment and failure to form sets of equipments, backward technology, low quality and high cost of products as well as with poor sales, overstocking and the typing up of large volumes of working capital. One crucial step in accelerating the turnover of working capital lies in putting special stresses on tapping unused potential, and undertaking renovation and transformation by the enterprises, thus seeking solution in the production process. What we did in the past was copied indiscriminately from the Soviet Union. We believed that the banks could only extend seasonal and temporary working capital loans, and equipment loans were regarded as a forbidden area for the banks. This resulted in advocating the contract of working capital every year, only to be followed by the queer phenomenon of typing up more working capital. The very purpose of undertaking middle and short-term loans for equipment is to free the hands and feet of the bank in order to handle flexibly the middle and short-term loans and the working capital loans so as to solve the crucial production problems of the enterprises, to make the enterprises use their working capital in a more rational way and to activate the working capital loans which have been tied up for a long time.

Since the People's Bank acts as a bookkeeper for the country as a whole and handles deposits, remittances and loans for various enterprises, it is well informed of economic news and market conditions and it can examine the projects presented by the enterprises from the macro as well as from the micro viewpoint. This is another advantage of the bank. The project of the Tianjin lighter factory was started in 1974; its product was regarded as a new product and was expected to make a headway in the international market. In 1980, another loan, 300,000 yuan in middle and short-term equipment loan, was awarded to this project. When this project came to the examination of the bank, the commercial credit assessor reported the obsolescence of its product and its excess stockpile in the Tianjin warehouse. The foreign trade credit assessor reported that its products sold sluggishly abroad and were not well accepted. Upon this information, the bank made timely reports to its superior authority and the project was canceled. Sui County of Hubei Province, which produces 1 million jin of fresh tussah cocoon annually, planned to set up a tussah reeling mill, and requested a bank loan of 500,000 yuan. With inter-office information among the bank, three questions were made clear. First, Xiangyang and Yun counties produce 2,000,000 jin of fresh cocoons every year, and the reeling millin Jun County needed a supply of 3,500,000 catties. This meant that with the old mill short of supply, a new mill would be duplicate construction. Second, the product does not yield profit. Beginning in 1980, the government stopped its subsidy. Third, tussah silk of our country has been exported to Eastern Europe, but what is needed there is mulberry silk. The bank reported all this to the country party committee, the project was canceled in the end, and loss was avoided. It is for this very reason of the bank's predominance in this respect that Sichuan Province and Chongqing Municipality entrusted their local revenues to the People's Bank to be lent out as middle and short-term equipment loans, mercantile industrial loans for equipment and loans for small hydroelectric generation, based on the belief that this is good for the enhancement of investment yields. Of course, in addition to the People's Bank, the Bank of Agriculture, the Bank of China, and the Bank of Construction should all undertake middle and short-term loans within their own scope of business. A monopoly exercised by any one bank is inappropriate.

Through practice, we have already found a new path to enhance investment results on the questions of funds. The appearance of government financial deficit and the need of investment in such sectors as light and textile industry, energy, communications and transport urges us to change our course and switch to the new approach of low requirement in investment, quick results and rapid turnover and to middle and short-term equipment loans. As facts have indicated, the middle and short-term bank loans have turned out to be a success. Generally speaking, such loans can be repaid within 1 year, much shorter than our previous investments, which needed 10 years. Needless to say, this is achieved under the condition of applying the loans for the purpose of tapping unused potentials, undertaking renovation and transformation of the existing enterprises. However, the latent possibilities of tapping unused potentials, undertaking renovation and transformation of the existing enterprises are enormous; "It is gold everywhere'" and enhancing production, increasing accumulation and improving the people's life by way of tapping unused potential and undertaking renovation and transformation of the existing enterprises have great prospects.

3) The middle and short-term bank loans enhance economic effects as indicated by micro-analysis and promote overall balance as indicated by micro-analysis.

The middle and short-term bank loan is a new product. Some comrades have raised all sorts of questions and are doubtful about it. To them, the middle and short-term bank loan does yield economic efficiency as indicated by micro-analysis, but the reverse is true from the standpoint of macro-analysis, since the loan stretches the capital construction front, ties up government revenue, destroys overall balance, and impedes readjustment, and is therefore undesirable. Our opinion is that these questions are basically settled, as indicated by our practice for more than 1 year that has just past. The following is our analysis in regard the main problems:

1. Is the capital construction front stretched by the middle and short-term bank loan?

The middle and short-term bank loan is mainly utilized in purchasing top-notch equipment and improving technology. The original plant is utilized and no civil engineering project is involved. Currently, the situation of the capital construction front is as follows. While there is a lack of steel products, lumber and cement, there is a surplus of bricks, tiles, lime, sand and stones. There is also surplus machine-building capacity. The middle and short-term bank loan fits quite well into the capital construction front situation, by reducing civil engineering projects to the minimum and putting the majority of the funds into machinery and equiopment. Of these loans, part of the special-item loans handed down by the various ministries do involve some civil engineering. For those projects that involve civil engineering, the banks strictly stick to the regulations of capital construction. When a loan is sought, the enterprise must produce a ratified project report, preliminary plans, budgetary estimates and construction progress plans. The banks refuse to extend a loan, if things do not follow the regulations. As for the supplies needed by the special-item projects, 50 percent are provided by the State Planning Commission and State Economic Commission, while the other 50 percent are provided by the local authorities. The supplies needed by the ordinary middle and short-term bank loans are supplied by the provinces and municipalities in a unified way. It should be pointed out that quite a large part of the special-item loans made in 1980 were assigned to existing projects by the various ministries of the central government which used the middle and short-term loans to complete the projects. For example 13 such projects were involved in Tianjin with loans amounting to 13.67 million. One of these was the Tianjin second cotton textile mill project, which was reconstruction and expansion work after an earthquake, involving almost 40,000 square meters of civil engineering construction with total investment of 40 million yuan. The project had been started in 1978 and was still under construction in 1980 and had a shortage in funds of 1.6 million yuan. The bank granted it a loan of 1.5 million yuan and the project was completed. Trial-running for production was made on 1 July 1980. From the viewpoint of the enterprise, 40 million yuan in investment has been saved by a loan of 1.4 million yuan. Due to the insufficiency of state investment, the Beijing wool-spinning factory, the Qinghe wool-spinning factory, and the Fourth wool-spinning factory were unable to put into production projects with imported equipment involving a total investment of 32 million yuan. A bank loan of 1.12 million yuan was granted in 1980 and the projects were finally completed. The Li An wool-spinning factory of Yanan City made an investment in constructing a new yarn-spinning workshop costing 6.44 million yuan. An actual investment of 4,040,000 yuan had been made since construction started in 1977, and the main body of the project had already been completed. With the help of the People's Bank, which extended to it a special item loan of 2.4 million yuan, the project was completed and put into production in July last year. By the end of last year, 49.8 tons of knitting wool were produced with an output value of 700,000 yuan and profit amounting to 197,000 yuan. It is the requirement of bank loans to make small investments with quick results and rapid turnover. Usually, no civil engineering is involved and long drawn out time-consuming "beard projects" are not allowed, since they stretch the capital investment front. For the present, the excessive length of our capital investment front is the outcome of the "leftist" influences which have brought about blind and duplicate construction over the years. The middle and short-term bank loans were started in 1979, amounting to 300 million yuan in the initial year. Such loans should not be blamed for the excessive length of our capital investment front in the past few years. In 1980, part of the middle and short-term loans were used to complete some civil engineering projects. Such loans played the role of cutting down the "beard projects," and shortening the capital construction front.

2. Have the middle and short-term bank loans tied up government revenue?

With regard to the repayment of middle and short-term bank loans for equipment, the State Council has made the following stipulations: "Enterprises under ownership of the whole people, can use all the increased profits, the fixed asset depreciation fund and the fixed asset taxes to repay their loan after operation of the project. If this proves to be insufficient, the enterprises may be exempted from the industrial and commercial tax for the increased portion of its production so that the tax funds may be used to repay the loan. Enterprises under collective ownership can use all their after-tax accumulation funds and fixed asset depreciation fund to repay their loan (during the period of repayment, the departments in charge are not allowed to draw on profits for the state and the various funds). If this is insufficient, the enterprises may use the income taxes and the industrial and commercial taxes on the increased products to make the repayment." This is a reasonable stipulation and is good for ensuring that the bank are strict in examining every loan and guaranteeing its economic effects.

The bank has persisted in adhering to the stipulations of the State Council in not "exacting money beyond the limit," and in not exerting unfavorable effects on the government's revenues. Some loan projects can be evaluated individually and some cannot be so evaluated. The reason for this is the overall enhancement of productivity, yielding larger economic results than those of the newly-constructed part. This is precisely the subtle contribution of tapping potentials and undertaking renovation and transformation. An agreement has been made among the branch bank of Tianjin, the department in charge and the government financial authority: When the economic results cannot be evaluated individually, the annual increment of profit after the loan project goes into production should be held for repayment of the loan, and partial repayments should be made as partial results come into effect, and it is forbidden to repay the loan by drawing on the base-point profit made before the loan project goes into operation. In the implementation of this measure it is the credit officer of the bank, the officer in charge of government finance and the enterprise who decide through consultation the amount to be repaid. For example, a special-item loan of 3.77 million yuan was granted to the sewing machine factory of Tianjin in 1980, which in the same year increased production amounting to 4.8 million machines, and profit and taxes by 960,000 and 560,000 yuan respectively. The bank, the government financial authority and the enterprise came to an agreement in a practical and realistic way through consultation, namely to make a repayment of 730,000 yuan on the special-item loan. The Tianjin branch bank reported the repayments of the loan as the occasions arose, and the government finance department never raised any objections.

The assertion that bank loans have tied up government revenue has much to do with the method of calculation. Some people calculate the growth rate of government revenue in accordance with the rate of increment of total value of industrial output, and refer to this as the natural growth rate. On this basis, the repayments of bank loans are regarded as deducting items and are deducted from the government revenue, and bank loans are deducted from the government revenues in the current year. In some places, profit targets are assigned in accordance with the rate of industrial growth of the current year, and repayment of bank loans by the enterprises is regarded as an income-reducing factor. There is no such thing as natural growth in the world. The increase of value of output is the outcome of many factors. The middle and short-term loan for equipment extended by the banks have already become an important factor in increasing the output value of the local industries. In some places, bank loans, are responsible for 20 to 25 percent of the results achieved. The practice of repaying bank loans according to the economic effects of the loans in order to facilitate extending bank loans to other enterprises not only helps the constant growth of industrial production but also the further growth of government revenues. This practice is totally in conformity with objective economic laws, and is in no way blameworthy. In 1980, the total middle and short-term loans of all banks across the country increased the national accumulation by 1.15 billion yuan, 560 million of which went to the banks as repayments of loans, while the remaining 590 million became additional revenues for the government. After the entire repayment of the loans, from the second year onward, the total accumulation will become government revenue. Therefore, instead of having reduced the government revenue, the middle and short-term bank loans have increased it.

3. Have the middle and short-term bank loans increased currency in circulation?

The regulation of currency in circulation is controlled by the People's Bank in two ways. On the one hand, the banks take in demand deposits and personal saving deposits from the various government bodies, social institutions and individuals in order to grant working capital loans to the enterprises and to regulate short-term funds. It is alleged that the middle and short-term loans of the People's Bank lack sources of funds in the long run. But this is simply not true. The People's Bank has taken in several tens of billion yuan in long-term deposits, but has only extended several hundreds of million yuan in middle and short-term loans. It has indeed taken a very prudent attitude. When the government finance is in deficit requiring overdrafts from the banks, should the banks stop the regular loan activities mentioned above? As indicated by our experiences of the past, we cannot do this. We certainly should not give up eating for fear of choking. During the war of resistance against Japan and the war of liberation, the bank had to issue more bank notes to support the war. Yet, the banks did not stop granting agricultural loans in wartime, as such loans rendered help to the peasants in rehabilitating their homeland under the scourge of war, and in restoring agricultural production in order to give forceful support to the revolutionary war, to serve the needs of the armed forces and the people, and to win final victory. When the major cities were liberated, with inflation still unchecked, we did not stop extending industrial and commercial loans. It must be understood that the solution to the problem of excess currency in circulation depends in the end on development of production. With production developed there will be more commodities, more government revenue, and more currency withdrawn from circulation, and the possibility of the disappearance of government financial deficits as well as the achievement of budgetary and bank credit balance. At present, in order to control the increase of currency and to withdraw more currency out of circulation, it is not only necessary to increase government revenue and reduce government expenses as well as to refrain from taking overdrafts, but also to increase bank deposits from the enterprises and the people and to cut down loans with poor economic effects. Currently, most of the bank loans are taken up as working capital funds in industry, commerce, foreign trade and material supplies. We should indeed make better studies to find out how to accelerate the turnover of working capital, and to reduce tied-up funds and waste in order to economize and to reduce the usage of loans. As for the middle and short-term loans, they are small investments, quick in results and rapid in turnover, which can be repaid within 1 year. They have achieved notable economic results in increasing commodity supply and government revenue. They have also played their role in helping the enterprises improve their production, and in enlivening the working capital and the working capital bank loans. Such loans are not factors stimulating currency increase and credit expansion, but rather factors withdrawing currency from circulation and reducing credit expansion step by step. Far from stopping the middle and short-term bank loans for equipment, we should further improve these loans and expand their scale, as they are already a powerful economic level for developing the light and textile industries, for activating the madhine-building industry, and for enlivening the national economy. Those comrades on the monetary and financial front should free themselves from misgivings. Instead they should be bold and assured, and do their best to do good work in extending the middle and short-term loans so as to find a road of our own for enhancing investment results as well as a new approach for rapidly developing the production of consumer goods, for accelerating the withdrawal of currency from circulation, and for wiping out government deficits and excess currency in circulation.

4. Is the extension of middle and short-term loans for equipment in violation of the principle of dual management of finance and credit?

The difference between government finances and banking lies in the fact that government revenues and expenses are uncompensated, whereas bank deposits and loans are compensated. The taxes and profits received by the public financial bodies are all uncompensated. Contrary to this, the deposits and savings received by the banks as well as the agricultural, industrial and commercial loans extended by the banks are all compensated. If this is taken as the basic principle governing the dual management of government finance and bank credits, then it follows that the extension of middle and short-term loans are the rational and normal.

As for the practice copied from the Soviet Union, with the capital construction investments and the fixed quota working capital to be appropriated by the government with the banks only responsible for providing seasonal and temporary working capital loans to the enterprises, and branding all these as the principle underlying the dual management of government finance and bank credit—these things are far from proper. This is the practice of the Soviet Union. It is in fact a funds-supply system of the nature of eating from a common big pot. As proven by decades of experience of our country, the uncompensated allocation of government appropriations for capital construction investment and fixed quota working capital gives rise to waste of funds and decreases economic efficiency. This practice has been basically nullified by the economic reforms of our country under way, which expand the decisionmaking of the enterprises, and allow the enterprises to retain their share of the depreciation fund and the major overhaul fund and to set aside part of profit as their own development fund, and by the State Council's decision to replace step by step the uncompensated allocation of government appropriations by bank loans to finance capital construction investment. The practice of dual management of government finance and bank credits in the Soviet Union was formulated in the 1930's. By the 1970's this practice can no longer be carried on. Beginning in 1976, loans have been extended in the Soviet Union by the State Bank to capital construction projects awaiting completion in 5 or less than 5 years. In 1978, 275.9 billion rubles of bank loans were issued in the Soviet Union, 68.4 billion of which were long-term loans.

In short, the middle and short-term loans for equipment undertaken by the People's Bank of China have enhanced economic efficiency, as indicated by micro-analysis, and have opened a new road for enhancing investment results. They have also strengthened overall balancing, as indicated by macro-analysis. By effectively giving support to the light and textile industries, they have facilitated the readjustment of proportions among agriculture, light industry and heavy industry. By giving support to the production of consumer goods, they have provided the material basis for readjusting the proportion between consumption and accumulations. They have not overstretched the capital construction front. On the contrary, they have helped in completing certain projects, and have shortened the capital construction front. They have increased government revenue, and lent a helping hand in eliminating government financial deficits. With respect to their size, they are of small size among the bank loan lendings and repyaments, and are characterized by rapid turnover and comparatively good economic effects which comprise a positive factor in withdrawing currency out of circulation. They have nothing to do with increasing currency in circulation. The middle and short-term bank loans for equipment have great vitality and very good prospect of development. As these are early days for their operation, hence the lack of experience, a small part of the special-item light and textile industry loans have yielded less notable results, or played a role in giving rise to duplicate constructions. From now on, we should constantly supplement our experience and conscientiously do our work well in this field. We must cultivate our expertise, especially in the areas of economic investigation and research, economic information and technical specialists, and technical economic specialists, in order to improve our bank loans and economic information work and to strive for the realization of the party's guideline of readjustment, restructuring, rectification and improvement.

300 BILLION YEN LOAN FROM JAPAN--Tokyo, 26 Aug (JIJI PRESS)--Japan plans to provide 300 billion yen (about 1,277 million dollars) in loans to China to help continue its plant construction projects, government sources told JIJI PRESS Wednesday. The plan would be formalized next week and offered to China early next month to obtain Beijing's (Peking) agreement by 20 September. Chinese Vice Premier Gu Mu could visit Japan for final adjustment, they said. Japan would give 100 billion yen (about 426 million dollars), originally earmarked for hydropower plant and tunnel projects, as a commodity loan and another 100 billion yen in a deferred payment credit. The remaining 100 billion yen in a deferred payment credit. The remaining 100 billion yen would be provided by banks, including the governmental Export-Import Bank of Japan. However, the Finance Ministry is strongly opposed to the bank loan on the ground that Japan is now trying hard to reconstruct its public finance. Thus the amount could be reduced at the next week's talks among ministries concerned. China, which has scrapped many plant construction contracts concluded with Japanese businesses due to its economic readjustment, has been asking Tokyo to extend huge loans to keep other plant projects alive. LIAONING CURRENCY WITHDRAWAL--As of 20 September, Shenyang Municipality had withdrawn 127.74 million yuan from circulation, 38.12 million yuan more than in the corresponding 1980 period. [SK261129 Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 25 Sep 81 SK]

TAX EVASION IN GUANGDONG--Guangdong has scored definite achievements in conducting investigations in tax evasion. According to reports by all prefectures and municipalities from May to July, 48,446 enterprises had conducted self-investigations and they had made supplementary reports on 10.42 million yuan of taxes that had been evaded. The taxation department organized forces and investigated 11,768 enterprises; and they discovered 23.45 million yuan in taxes that had been evaded. By the end of July, a total of 20.32 million yuan of those evaded taxes had been handed in to the state treasury. In addition, during the period, 12.86 million yuan of tax in arrears had been cleared up and delivered to the state treasury. COAL SUPPLY FORUM--Tianjin, 24 Sep (XINHUA)--According to the National Coal Supply Production and Technical Research Forum recently held in Tianjin, it is necessary to change the coal supply method to conserve coal. The new method will blend coal that contains a large quantity of heat with coal that contains a small quantity of heat and process it into a new kind of coal. [Beijing XINHUA Domestic Service Chinese 0029 GMT 24 Sep 81 OW]

PETROLEUM SOCIETY MEETING--Changsha, 28 Sep (XINHUA)--The Chian Petroleum Society held its second annual meeting in Changsha from 16 to 22 September. More than 400 scientists and technicians from the Ministries of Petroleum Industry, Geology, and Chemical Industry; the Chinese Academy of Sciences; various institutions of higher learning and PLA departments concerned were present. Society President Hou Xianglin, who is also vice minister of the petroleum industry and member of the scientific council of the PRC academy of sciences, presided over the meeting. The participants took note of the petroleum industry's temporary difficulties caused by production slumps at the country's several major oilfields. However, they pointed out that it is still possible for the country still to maintain an annual oil output of 100 million dun by tapping the old oilfields' potentials and developing new petroleum outcroppings where there has been an oil reserve. [Beijing XINHUA Domestic Service in Chinese 0036 GMT 28 Sep 81 OW]

OIL, GAS FINDS--NCNA--Beijing 24 Sep--Chinese marine geologists have completed a petroleum geological survey over an area of 1 million square kilometers of coastal waters during which they discovered six major oil and gas depressions, greatly expanding China's marine petroleum and gas reserves. These six big oil and gas depressions are the Bohai Depression, the South Yellow Sea Depression, the East China Sea Depression, the Pearl River Estuary Depression in the South China Sea, the Beibuwan Depression and the Yingge Depression. INDUSTRY

SHANGHAI TEXTILE INDUSTRY URGED TO INCREASE PRODUCTION

Beijing RENMIN RIBAO in Chinese 27 Aug 81 p 1

[Article: "Strengthen Political and Ideological Work, Carry out System of Economic Responsibility, Reform Products and Technology; Accelerate Speed of Development of Shanghai's Textile Industry; Shanghai Textile Bureau Mobilizes All Employees to Make More Contributions to Elimination of All Difficulties and Pursuit of Increased Production and Income"]

[Text] Reporter Wu Fumin [0702 1788 3046] reports: Strengthening political and ideological work, carrying out the system of economic responsibility and product improvement and technological reform are three important measures recently issued by the Shanghai Textile Bureau to accelerate development. They mobilized 450,000 employees in the system to eliminate all difficulties, guarantee completion of the year's output of 14 billion yuan, an increase of over 900 million yuan over last year; and the part of profits turned over to the state of 3 billion yuan, an increase of nearly 2 billion yuan over last year.

Since 1977 the rate of growth of Shanghai's textile industry has been over 10 percent for 4 years in succession and in the first 7 months of this year the industry has completed over 8.05 billion yuan gross value of industrial production, an increase of 5.5 percent over the same period last year and has reached a state of saturation in terms of time, space, equipment and manpower.

When summarizing the work of the first 7 months, the bureau's Party committee analyzed the national situation and was dissatisfied with the rate already achieved. They felt that in the period of national economic readjustment, for the nation to accumulate forces requires a certain rate; improving the people's standard of living also required a certain rate. Whatever the difficulties of Shanghai's textile industry, it should use all means to increase their rate. The bureau's leadership sent down to the factories asking for help, invited the factory cadres for a conference and together with the subordinate industrial companies and offices within the bureau they settled accounts one by one. From investigation and study they found measures to accelerate the rate of development.

Raising the rate of attendance is a breakthrough in strengthening ideological and political work. In the first half of this year, absenteeism was 2.7 percent higher than for the same period last year and the rate of attendance was only 89 percent. The bureau leadership feels that strengthening ideological and political work now requires that we take the clearcut stance of supporting healthy trends and attacking perverse trends and not accomodate ourselves to backward consciousness among some employees. The bureau Party committee clearly demanded that factories mobilize those employees who absent themselves so their children can work to subordinate their personal interests to the interests of the nation and return to work at an early date. They also stipulated that employees will not be permitted to request leave to take care of personal enterprises. Those who have stayed away from work for a long time without good reason, after discussion by the plant employees organization, may lose their seniority or be dropped from the plant. The bureau commended advancement in a big way, propagandizing the idea "every person has a share of responsibility for the resurgence of the motherland" and maintain vigorous enthusiasm of employee ranks to gradually increase the rate of attendance.

Another important part of strengthening ideological and political work is to smash selfish departmentalism and complacency and to organize activity to emulate, learn from, catch up with, and help others. The Shanghai woollen industry has 10 worsted mills of which the efficiency of the third and sixth woollen mills is above 90 percent, but that of the deficient mills is only 78 percent. If all of the bureau's mills achieved the level of the advanced mills it would increase the annual output of worsted woollens by 330,000 square meters. The difference between the highest and the lowest costs of the 10 major commodities of the cotton textile industry is 11 percent, if the deficient mills reached the levels of the advanced mills it would uncover a potential of 5 percent - 6 percent. Under the prodding of the bureau and the companies, activity to "learn from the advanced, find disparities and compare contributions" has already been started systematically.

In the process of carrying out the system of economic responsibility, the Shanghai Textile Bureau has also discovered new problems. Some mills in grasping production have "thoughts about the future" and once they have reached a certain speed, "hold back a trick or two." Through investigation, the bureau's Party committee decided to in adopting methods to change rewards within the bureau to encourage enterprises to go all out to increase production, the more they surpassed the more they get to resolve everyone's "thoughts about the future." The bureau's Party committee also decided that through comparison and assessment according to the 6 norms for rectifying enterprises which were stipulated by the State Economic Council, to classify enterprises and carry out a method of no ceiling on bonuses for advanced enterprises, the more they worked the more they got. For the few enterpries which were poorly managed, they could consider reducing or not awarding bonuses.

The three measures for accelerating the speed of development proposed by the Shanghai Textile Bureau are to improve product reform and technological reform, to change shipping commodities to the interior into shipping technology and through reducing domestic sales release energies for expanding exports; to improve commodity escalating foreign exchange and create even more high quality and high price goods; make way for popular goods which fraternal provinces and cities can already produce and open up the territory for new varieties with Shanghai's characteristics, constantly develop new woven goods; vigorously expand the clothing industry and increase economic benefits.

SHANGHAI HOUSING CONSTRUCTION--The Shanghai municipal work conference on rural construction sponsored by the municipal capital construction and agriculture commissions ended on 16 September. The conference is the first of its kind in the municipality. In the past 4 years an average of 5 million square meters of housing was built in the rural areas every year. The figure is expected to reach 8 million square meters in the next few years. [OW211305 Shanghai City Service in Mandarin 1130 GMT 16 Sep 81]

LIAONING RESIDENTIAL CONSTRUCTION--In the January-September period, total floor space of housing under construction in 12 municipalities and prefectures in Liaoning Province came to some 8 million square meters, an increase of 80,000 square meters over the corresponding 1980 period. Floor space of housing completed and utilized reached some 2 million square meters. The floor space of housing completed in 1980 was 30 percent more than in 1979, surpassing total construction for 1976, 1977 and 1978. This is the third best record in our country. COUNTY FOREIGN TRADE COMPANY DOING WELL

Shanxi SHANXI RIBAO in Chinese 17 Aug 81 p 1

[Article by Xiang Zhao [0686 3564], Zhi Feng [1807 1496], Jian Hua [1696 5478], Zhi Xin [1807 0207], and Wan Quan [5502 3123]: "Yuncheng County Agricultural-Industrial-Commercial Foreign Trade Company Is Doing Well")

[Text] The Yunchen County Agricultural-industrial-commercial foreign trade company formed by state-operated, collective, and individual enterprises has earned 910,000 yuan in foreign exchange for the state and a net income of 250,000 yuan over the past 6 months.

The foreign trade company was established in the second half of last December. Some 260,000 yuan were raised as capital. The former county state-operated foreign trade processing plant put all of its fixed assets into the company as share capital, accounting for one-third of the total amount of money for shares in the company. One-third of the remaining money for shares in the company came from the scattered funds raised from among commune members and individual laborers. Each share was valued at 100 yuan and dividends were paid based on the amount of shares held. Of the total amount of profits, 55 percent was paid out as dividends based on the number of shares, 30 percent was set aside for enterprises, and 15 percent was taken as labor insurance fees and bonuses for workers. Of the 103 workers, 11 are state employees, and the others are rural commune members and urban youths waiting for jobs.

The export company has four plants whose main lines are to slaughter and freeze the meat of cattle, horses, donkeys, and mules released from service; to process and freeze sparrows; and to deliver goods of the state grain and oil export corporation to the port of Tianjin. The plants have also developed processing of scores of types of goods such as leather shoes, fur linings, and fur bedding.

Half a year's practice has demonstrated the good points of this export company: 1) The superiority of each side is brought into play to the advantage of the state, the collective and the individual. With the expansion of the operation of the export company's processing plants, the problems of funds, land, equipment, and manpower are solved. The processing plants, which previously lost money over the years, are now making great contributions to the state. Production teams have utilized their equipment capacity that had long remained idle. With part of the commune members working with enterprises, an outlet is opened for absorbing the manpower made surplus with the introduction of the responsibility system. Scattered amounts of cash not required by individuals for immediate use are pooled and put into constructive undertakings, giving them material benefits. Recently, the company paid half-year dividends of 10 yuan per share in advance, totalling 26,000 yuan. 2) Animal products are put to multipurpose use, thereby turning waste into treasure. In the past, cattle eyes, bladders, donkey tongues, and donkey hearts were thrown away as waste. Now, they are used for multiple purposes. By processing these wastes into industrial and pharmaceutical materials, income is increased. This item alone generated a net income of 40,000 yuan in the first half year, of which 10 percent was set aside and paid to the customers. 3) A group of commune-brigade enterprises have been revived. Dongliu brigade's precast slab plant was shut down because its products found no market. After joining in the combined operations, the company provided the plant with funds and raw materials and underwrote the sale of its products, with the result that the plant earned a net income of 70,000 yuan in half a year.

FRAUD, CORRUPTION IN PRODUCING 'WELFARE PRODUCTS' DESCRIBED

Shanghai WENHUI BAO in Chinese 24 Aug 81 p 1

[Article: "Four Harmful Effects of 'Welfare Products'"]

[Text] So-called "welfare products" turned out by plants and enterprises have brought on quite a few evil effects, severely affecting the use of state raw and processed materials and the arrangement of production plans, lashing at normal commercial affairs, scooping state revenues, and lending themselves to evil practices. This should be taken seriously and rectified immediately. Such is the conclusion drawn by the municipal finance bureau from a large amount of data after making an overall investigation.

On 29 June and 22 July, WENHUI BAO published letters from readers criticizing the "welfare products." Leading comrades of the municipal people's government took a serious view of this matter and instructed the departments concerned to make investigations. The municipal finance bureau has wound up its investigation and sent an investigation report to the municipal people's government. The Shanghai trade union council is going on with the investigation.

According to the municipal finance bureau's report, so-called "welfare products" are extensive in scope and are increasing in variety. Among these products are table fans, floor electric fans, folding deck chairs, standing desk lamps, wall lamps, sofas, television sets, furniture, high-grade candy, etc. Some plants are contemplating the production of washing machines. According to incomplete figures, 49 units under the Bureau of Metallurgical Industry, the Electromechanical Bureau No 1, the Electromechanical Bureau No 2, the Shipbuilding Bureau, and the Navigation Office have turned out 41,276 electric fans (the vast majority being floor electric fans), 3,318 deck chairs, 3,000 wall lamps, 280 standing table lamps, in addition to sofas, television sets, etc. Some units under the instruments and metals, textile, light industry and pharmaceutical industry organizations have turned out such products. Some scientific research units, schools, shops, etc have also produced so-called "welfare products."

Citing massive data, the investigation report analyzes the grave situation arising from the practice of fraud and the encroachment on state interests in the process of producing and handling so-called "welfare products."

In the name of "caring for the life of its workers," during the spring festival this year the Shanghai Soda Water Plant packed 30,454 jin of six kinds of high- and medium-quality toffees--Chocolate (market price 3.10 yuan per jin), Swan (2.30 yuan per jin), Xilinmen (2.15 yuan per jin), Kelimu (2.62 yuan per jin), Kuaile Taifei (1.90 yuan per jin), and Huasheng Niuya (1.55 yuan per jin)--into 2,734 5-jin boxes and 8,392 2-jin boxes. Practicing fraud they put on labels saying "101 (low-grade) assorted toffees." They then sold the candy at 0.833 yuan (lower than cost) to the Guanshengyuan Confectionary Shop. They asked the shop to supply the plant workers and other cooperating units with candy at 1.05 yuan per box against red and blue "candy purchase coupons" issued by the Shanghai Soda Water Plant. Five jin were supplied against each red coupon and 2 jin against each blue coupon. Each of the plant workers was given one red coupon and two blue coupons. Some cooperating units also got some "candy purchase coupons." This amount of candy scooped 27,000 yuan from state revenues.

The Shanghai Optical Instruments Plant, which lacked production orders last year, was assigned by the higher leading department to produce 5,000 double-duty floor fans. The bureau arranged the allocation of materials to the plant, the bank gave the plant a loan, and the finance department allowed the plant a 1-year tax deduction. However, the plant, breaking up the whole into parts, transformed state planned products into "welfare products," transferred more than 3,000 fans not yet fitted with parts elsewhere, and "sold" the fans to the Huamei Lamps and Lanterns Shop in Luwan ward under the label "floor lamps to be disposed of." Arrangements were made for the plant trade union to issue 3,130 coupons (60 were issued to Huamei), against which purchases could be made at a price about 100 yuan lower than the market retail price. Calculated on the basis of 3,130 fans, the state would lose tax and profit receipts amounting to 300,000 yuan.

The municipal finance bureau has found from its investigation that the "welfare products" turned out by some units have brought on a chain of undesirable consequences: 1) State interests are encroached upon. Calculated on the basis of 50,000 "welfare electric fans" produced in the municipality, each causing a loss of 70 yuan in tax and profit to the state, the total amount of losses would come to 3.5 million yuan. 2) The party is defamed and social values are corrupted. When handling "welfare products," quite a few enterprises, learning the "art of building relations," gave "welfare products" to various units to cultivate "friendship." In this way, state funds flowed into the hands of small groups and individuals through these loopholes. 3) The unity of workers is undermined. When distributing "welfare products," certain leading cadres and economic office personnel, being in a favored position, picked the big and took more, thereby giving rise to contradictions between cadres and the masses and among the masses and undermining their unity. 4) Violations of law and discipline are induced. Some plants producting "welfare products" kept separate books and followed incomplete procedures. Items moving in and out were not recorded and book entries were thrown into confusion. This opened the door to corruption, embezzlement and violation of law and discipline.

LABOR AND WAGES

BRIEFS

GUANGZHOU LABOR, EMPLOYMENT CONFERENCE--The Guangzhou municipal labor and employment work conference, which lasted for 3 days, concluded on 28 August. The conference summed up the experience in making arrangements for employment in the first half of this year and studied how to do a good job of promoting labor and employment in the second half. The conference noted that organizing labor service companies is a relatively good way of making arrangements for employment in the future. They cost little to operate but can provide a great deal of employment. The conference also noted the great achievements scored in labor and employment work this year because of the flexible policy adopted. In the first 6 months, the municipality has arranged jobs for more than 48,500 people awaiting employment, fulfilling 52.7 percent of the annual task. The proportion of youths among people engaged in individual business undertakings has increased from 5 percent when the business undertakings were first initiated in 1979 to its present 46.3 percent. TRANSPORTATION

BRIEFS

RAILWAY TRANSPORT REGULATIONS--Beijing, 23 Sep (XINHUA)--A set of new regulations governing railway freight transportation will be adopted beginning 1 October this year. With these 55-provision regulations, which will replace the 1971 regulations, the railway departments will be able to serve various economic departments according to economic law and under better administration as the new regulations clearly stipulate the rights and obligations of the consignors and the consignees as well as their economic responsibilities. [Beijing XINHUA Domestic Service in Chinese 1528 GMT 23 Sep 81 OW]

RAILWAY QUARANTINE--Taiyuan, 24 Sep (XINHUA)--China's railway quarantine network has developed from a regional into a national one as more quarantine stations have been set up in most provinces, municipalities and autonomous regions in the country and more quarantine officers have been trained. This has enhanced effective control of the spreading of livestock disease from one place to another, promoted development of animal husbandry and developed foreign trade. During the 10th annual convention on railway quarantine, which ended in Taiyuan, Shanxi, on 23 September, experimental measures governing the scope of quarantine by the railway veterinarians were adopted. STATE COUNCIL SETS UP TWO ECONOMIC RESEARCH CENTERS

Beijing GUANGMING RIBAO in Chinese 30 Aug 81 p 1

[From our reporter Xie Jun [6200 6511]: "State Council Sets Up Two Research Centers to Recruit Specialists"]

[Text] Following the establishment of the Economic Research Center in August last year, the State Council set up a Technological and Economic Research Center not long ago. A group of specialists in social science and natural science and with a knowledge of the overall economic situation have entered Zhongnanhai to serve as consultants on the economic development of our country.

The mission of the Economic Research Center is to concentrate on studying realistic problems of strategic, comprehensive and long-range significance by integrating theory with practice. The main task of the Technological and Economic Research Center is to conduct, from the standpoint of the overall economic situation, a feasibility study of the important technological and economic measures and construction projects handed down for discussion.

Over the past year, the Economic Research Center has held many discussions on the restructuring of the systems of labor, banking, taxation, pricing, and finance, and has put forward various plans and schemes. Centered on the growth of the national economy and the problem of overcoming the present economic difficulties, the center made a monographic study and put forward diverse measures and proposals for developing production of consumer goods, reorganizing the enterprises, improving the foreign trade policy, and cutting down commercial floating capital. The proposals put forward by the Economic Research Center have received great attention from leading comrades of the Central Committee and quite a few of the proposals have been accepted.

Recently the Technological and Economic Research Center convened specialists in railways, communications, electric power, geology, environment, and economics to take the initial steps to expound and prove a report by a vice premier on the exploitation of Shanxi's coal resources. After making a careful analysis and study, the specialists subscribed to the idea advanced by the vice premier. At the same time, they put forward some views and proposals concerning the scope and policy of exploiting Shanxi's coal resources.

Among those joining these two research centers are social science and natural science workers from scores of research units of the China Academy of Sciences, the China Academy of Social Sciences, and the central ministries and commissions. The Economic Research Center and the Technological and Economic Research Center have set up their own standing secretariats responsible for leading and organizing the activities of both research centers. The two standing secretariats are respectively under the charge of Xue Muqiao (5641 2550 2890), adviser to the State Planning Commission and director of the State Planning Commission Economic Research Institute, and Ma Hong (7456 3163), vice president of the China Academy of Social Sciences.

SONODA ON IMPORTANCE OF FREE ECONOMY TO PRC

OW220035 Tokyo KYODO in English 0018 GMT 22 Sep 81

[Text] New York, 21 Sep (KYODO)--Foreign Minister Sunao Sonoda said here Monday that Japan, the United States and Europe must cooperate in bringing the Chinese economy into the mechanism of the free economy.

Sonoda said Japan is not disappointed with the fact that the "Japan-China economy" has not expanded by leaps and bounds.

Speaking at a luncheon meeting of the Japan Society in New York, the foreign minister said China should not be looked at as a market now. Rather, he added, China should be regarded as whether it is together with the United States from the viewpoint of strategic importance.

He stressed that it is important for China's economy to be incorporated into the mechanism of the free economy and that Japan, the United States and Europe must cooperate for that purpose.

Sonoda said the lowering of level of balance of power is important for the maintenance of perpetual peace and stability. He emphasized the need for nations to strive for disarmament and arms reduction.

Sonoda said solidarity and cooperation with the United States is the "most important cornerstone" of Japan's foreign policy. He said the Soviet Union's increase in military power and advance in the Third World have raised tension in East-West relations and cast dark clouds on world peace.

Sonoda said the economic stagnation has lowered the comprehensive power of the Western world, and obstructed the economic growth of the Third World. The foreign minister said Japan will continue to try to have dialogue with nations with which it has different interests. He said it is also important for Western nations to cooperate with the Third World. He said Japan will also promote dialogue between North and South and extend economic cooperation.

Sonoda said he hoped in his meeting with Soviet Foreign Minister Andrey Gromyko Wednesday to find a clue to the opening of dialogue with the Soviet Union, keeping in mind that Japan's basic policy is to seek return of the northern territories.

QINGDAO WORKS OUT DETAILS OF ECONOMIC RESPONSIBILITY SYSTEM

Shandong DAZHONG RIBAO in Chinese 23 Aug 81 p 1

[Article by Chang Fengchen [2490 7364 5256] and Cui Sulan [1508 4790 5695]: "The Relations Between Three Sides Are Correctly Handled by Qingdao Enterprises"]

[Text] Correctly handling the relations between the state, enterprises and individuals and firmly implementing the economic responsibility system, the industrial and communications enterprises in Qingdao municipality have achieved the results of more revenue for the state, more profits retained by enterprises, and more income for individuals. Industrial production reached a record level in June and achieved good results in July after beating the intense heat of summer.

This year, Quingdao municipality has put into practice the system of economic responsibility among industrial and commercial enterprises by making various industries underwrite profits and arranging for various bureaus, factories and enterprises to sign contracts to underwrite profits. But the protracted influence of the "left" ideology produced a number of problems in the distribution of wage bonuses within enterprises, hindering further implementation of the responsibility system. For example, some enterprises could not draw a dividing line between indiscriminate distribution of wage bonuses and distribution according to work, not daring to let those workers making a greater contribution get larger bonuses. In solving this problem, leading comrades of the municipal committee and government and the responsible persons of the economic committee, finance committee and labor department went to enterprises to investigate and study. They summed up four manifestations of indiscriminate distribution of wage bonuses, and drew a distinction between indiscriminate distribution according to work. After that, on the basis of proposals from cadres and the masses, a system of "contracting production with remuneration linked to output" as the main form was put into practice. So far, 61 enterprises in the municipality have put into practice the system of "contracting production with remuneration linked to output." Among them, 55 state-operated enterprises projected profits accounting for 54.7 percent of the total amount projected by state-operated municipal enterprises. In implementing the economic responsibility system, they took special care to solve the three following problems:

1. Correct handling of relations between the three sides and guarantee of more revenues for the state, more profit retention for enterprises, and more income for the workers. In drawing up measures for contracting production, they began by working out different measures according to the characteristics of different enter-

prises. There are three measures: 1) In the case of enterprises making large profits, profits are taken as the keypoint of contracting production. In this way, profits are closely linked to the immediate interests of enterprises and their workers, and more income will be made for enterprises and individuals on the basis of guaranteeing increased revenues for the state. For example, the Qingdao Dyestuff Plant underwrites 11 million yuan in profits against a state projection of 8 million yuan for the current year. If the plant reaches the target underwritten, each of its workers can draw 180 yuan in above-target wages. If profits top the target by an additional 1 percent, each worker can draw 1.80 yuan in additional above-target wages. If the plant fails to fulfill the profit plan, for each 1 percent unfulfilled, 0.5 percent of total wages will be withheld. 2) When the quality of products is guaranteed, output is taken as the keypoint of contracting production to encourage the workers to produce more. The Quingdao Watch Factory contracts production with output as the keypoint. Under the terms of the contract, if the factory fulfills the plan for 900,000 watches, each worker can draw above-target wages amounting to 90 yuan. If output is between 900,000 and 1,250,000 watches, for each additional watch made, an additional above-target wage amounting to 90 cents will be issued. If output exceeds 1,250,000 watches, for each additional watch made, an additional 1 yuan will be issued. 3) Production is contracted on the basis of calculating taxes and profits. The Qingdao Cigarette Factory contracts production. Under the terms of the contract, the factory is to reach the target of 175 million yuan in taxes and profits. After the target is reached, each worker can draw above-target wages amounting to 170 yuan. For each 17.5 million yuan generated in taxes and profits, each worker may draw an additional 17 yuan. These three measures unify the interests of the three sides, guaranteeing more revenues for the state in the first place.

2. All the contracting enterprises have put into practice different forms of economic responsibility system internally to overcome egalitarianism and bring the positive factors into play. Previously, the Qingdao Printing and Dyeing Mill calculated bonuses according to points, "eating partly from the big pot." After contracting production, the mill stopped "eating partly from the big pot," and introduced three-level accounting, linked remuneration to output, checked output at the group level and held individuals responsible for their work. Under this system of responsibility the workers can see how much contribution each meter of cloth makes to the state and how much income each worker gets. Furthermore, corresponding responsibility systems have been instituted for various working procedures and cadres of various service departments and offices. As a result, the whole mill is seething with activity. July output was up 8.6 percent over June and profits were up 19 percent.

3. In the light of reality and taking into account the degrees of profit-making possibilities and the irrational state of product price, tax receipt and profit, the problem of preponderant difference between above-target wages issued by different enterprises to their workers who perform more or less the same magnitude of labor is solved. In implementing the responsibility system of contracting production with remuneration linked to output, the municipal committee and government heard the views of the masses, thoroughly weighed the relationship between the magnitude of above-target labor and the above-target wages, and initially solved the problem in diverse ways. For example, in the case of those enterprises which have small margins but pay heavy taxes, taxes and profits are calculated together; in the case

of those enterprises that contribute more but make less profits, the proportion of above-target wages is appropriately increased so as to bring them into line with the wages issued by the enterprises in general. Soda ash, the main line of the Qingdao Chemical Fertilizer Plant, is a product with a small margin. The state has not set any profit target for the plant this year. After introduction of the economic responsibility system--contracting production with remuneration linked to output--each worker can draw 180 yuan in above-target wages when 1 million yuan profits are made. This will satisfactorily resolve the contradiction between a larger contribution and less remuneration in the case of enterprises that make less profits. The Qingdao Tonghai Rubber Factory makes large profits, and the contract stipulates that after fulfilling the above-target profits underwritten, each of its workers may also draw 180 yuan in above-target wages, but this is only equivalent to 10.6 percent of the above-target profits realized.

When remuneration was linked to output and one's heart, contracting production worked. The economic responsibility system implemented by Qingdao industrial and communications enterprises has smashed the iron rice-bowl and removed the big pot. The results of an enterprise's operation are directly linked to the economic interests of the workers. Cadres and workers concern themselves with their enterprises and production, and industries and communications are becoming more prosperous every day.

DEPARTMENTS URGED TO ENCOURAGE INDIVIDUAL COMMERCE

Jian DAZHONG RIBAO in Chinese 27 Aug 81 p 3

[Article by Liu Zuoqing [0491 4373 3237]: "Questions Related to the Development of Individual Commerce"]

[Text] The present level of productive forces in our country determines the necessity of letting diversified sectors of the economy exist side by side. The state-operated economy is the main body and leading force on the market, but it is not possible for it to purchase all of the several hundred thousand and even several million kinds of products produced by the material production departments in society to satisfy the diverse demands of the broad masses of the people. Therefore, despite the fact that the quantity of products handled by the state-operated commerce is large, the variety of products handled and the scope of services performed are, after all, still limited. At the same time, the state-operated commerce suffers from certain limitations of time and space. Individual commercial enterprises, including the catering trade, service trades, and repair and spare parts shops, can make up the deficiencies of state-operated commerce. The individual commercial enterprises, which mainly carry on manual operations with a small amount of capital and for small margins, are so flexible and adaptable that they can change the direction of service any time in accordance with changes in market supply and demand. In their case, business hours may be extended or shortened according to business conditions. As to localities of business, individual commercial enterprises may make do with whatever is available. Shelters may be converted into shop fronts, stalls may be set up and wares hawked in the streets. Many fresh foods can hardly be handled by large stores and many types of manual repairs and darning which are beyond the capacity of state-operated repair trades, which are comparatively mechanized, can be handled by self-employed laborers and individual producers. Thus, in making good omissions and deficiencies, individual commerce is indispensable to the socioeconomic life. Furthermore, individual commercial enterprises which absorb a large number of unoccupied laborers provide an avenue for solving the employment problem for youths awaiting jobs.

By the end of April 1981, the number of individual commercial enterprises reached 1,520. Although their growth rate has not been fast enough, they have initially demonstrated their role as a force not to be ignored. Difficulties in getting catering service, clothing and repair service are beginning to diminish. Some famous dishes are gradually being brought back, and many "neglected lines" in repair trades are appearing and increasing in number. But even so, they are still far from the objective requirements of society. In 1957 the number of individual commercial enterprises averaged 18, occupying 700 square meters of floorspace per 1,000 residents, but by the end of 1980 the number of such enterprises was only 3, occupying 330 square meters of floorspace per 1,000 residents. This shows that viewed from the actual requirements of society as a whole, individual commerce should be further developed.

There are many reasons why the development of individual commercial enterprises has been adversely affected. For one thing, individual commercial enterprises have long been accorded a low social status. As a result of the left ideological influence, some people look down upon the individual economy as a capitalist undertaking, and because of this they consciously or unconsciously view it in a different light. Individual industrialists and businessmen themselves are not at ease, and their children tend to do everything to prevent them from starting up individual enterprises lest it should jeopardize their chance of going to school, finding jobs and lest they be marked. In short, public opinion has not yet given the green light to individual commercial enterprises.

Second, another problem worthy of attention is that too much interference comes from certain departments. There is not a unified system of administration. Anyone who wants to start a business must go through a number of departments and links, often taking several months from the time of sending in an application to the time of obtaining approval from the commercial department, industrial-commercial department, urban planning department and, in some cases, from the public security department. After the start of business, some departments will impose more restrictions, withhold aid, indiscriminately interfere and even ban the business.

Third, failure to insure the source of goods directly affects the vitality of individual commerce. For example, no practical and feasible measures have been worked out to provide goods under state control such as aluminum plates, soldering tin, and tinplates required by the repair trades. Owing to lack of coordination and connection between the bureau level and the wholesale departments, it frequently happens that the repair trades are unable to obtain spares and fittings such as bicycle parts, needles and thread, buttons, shoe nails, etc.

Fourth, state-operated enterprises, collective enterprises and individual enterprises are not yet treated equally in terms of political status and economic remuneration. Although the principle has been laid down as far as the central authorities are concerned and although employment obtained through recommendation by the labor department, employment obtained by getting organized, and employment obtained through one's own efforts are all regarded as employment, the gaps between them are wide in the real world. Individual enterprises are far behind collective enterprises, not to mention state-operated enterprises.

Below are some proposals made to the departments concerned for their reference concerning the development of individual commercial enterprises.

First, go a step further and mold public opinion in favor of individual commerce and propagate the importance of diversified channels of circulation as well as their position and role in the economic growth. In particular, it is necessary to get rid of the incorrect views on individual economy, to imbibe the spirit of the current policy of employment, to set minds free, to go all out, to open all avenues, and to pursue concrete policies to aid the growth of individuals commerce.

Second, strengthen leadership and unify the administration. The individual economy is characterized by dispersion, great flexibility, and fewer limitations of time and space in operation. It creates favorable conditions not provided by state-operated enterprises. But it also brings with it drawbacks: scattered operation making it difficult to manage, profit-making aim making it difficult to guarantee commodity quality, and possibilities of practicing fraud and evading taxes. This makes it necessary to strengthen leadership and unify administration with regard to the aim, direction, location and means of operations. But the principle of management should be "control without stifling, stimulate without throwing into confusion." The following tendencies should be avoided: As soon as stress is laid on management, all departments advance simultaneously and control it to such an extent as to stifle it. Or any slight rectification and stimulation will throw it into confusion. We maintain that laws should be made with the object of unifying administration. Provided a business license is issued by the industrial-commercial bureau and the consolidated tax or administrative fees have been paid, these certificates and documents should take legal effect at once, and no one may interfere arbitrarily.

Third, delegate some authority to the lower level. Judging by the tendency of development, the individual economy will go on developing and individual commercial enterprises will continue to increase. At present, they are stocked with goods from grade-2 wholesale units. The amount of funds involved is small, as is the quantity of stocks laid down piecemeal. This situation gives great trouble to grade-2 wholesale units. Is it advisable to consider delegating wholesale authority to the ward level so as to make it convenient for small business to replenish stocks while minimizing the trouble to which grade-2 wholesale units are put? Or can arrangements be made under which purchasers are entitled to wholesale price or a price approximate to wholesale price if the purchase exceeds a certain quantity? This will make it convenient to replenish stocks and promote sales, which in turn will accelerate the circulation of commodities.

ARTICLE DECRIES RELIANCE ON 'IRON RICEBOWLISM'

Guangzhou YANGHENG WANBAO in Chinese 16 Aug 81 p 2

[Article by Chu Ruigene [0328 3843 5087]: "On 'Rice Bowls'"]

[Text] It is said that some foreign scientists and technicians working at sites in our country are diligently studying in their dormitories during after work hours, delaying sleep. When our reception personnel urge them not to work so hard, the answer they receive is "That won't do, if we do not understand the latest knowledge in our fields, we won't be able to keep up and our bosses will fire us, breaking our ricebowls. It is not like China with its superior socialist safeguards where one will not be unemployed due to incompetence or dereliction of duty!"

The foreign scientists and technicians still "study diligently, delaying sleep" in their after work hours and our reception personnel still urge them "not to work so hard." You can see that this causes me to lose my appetite a little. To continue with a look at the first half of the foreigners' reply, it seems two things can be said: In addition to the private sector employment system being too cruel, if one does not diligently study new knowledge, then the enterprise or factory will lag behind times and the company boss' own "ricebowls" would also be "broken" and how could he possibly insure the "ricebowls" of those below him! The problem is seen in the following words: "It is not like China with its superior socialist safeguards where one will not be unemployed due to incompetence or dereliction of duty!" It shows clearly in their words, it seems to be praise (many of us Chinese love to hear these words) when actually it sounds to me more like a slap in the face.

Ha! "with superior socialist safeguards where one will not be unemployed due to incompetence or dereliction of duty"--this links socialism with the "iron ricebowls"! The foreigners are not really talking nonsense. Our current lifestyle is just so.

To be sure, "socialism" has many superior characteristics, otherwise people would not cherish it and a lot of people with lofty ideals would not sacrifice for it. Nevertheless, this superiority lies in a system of destroying man's exploitation of man. The leaders pushed themselves onward diligently creating material and spiritual wealth. And yet it absolutely does not lie in entering a socialist society and carrying an "iron ricebowl." "Incompetence" and "unemployment" notwithstanding, this ricebowl cannot, in the end, be lost.

However, over the past several years, our perception of socialism has actually been connected with the "iron ricebowls" and the maddening thing is that it depends on this. You see, clearly written upon the banner of socialist distribution principles the words: "From each according to his ability, to each according to his work," and "More pay for more work, he who does not work does not eat." The "does not eat" is the broken "ricebowl." For a considerable time, there has not been particular mention of "More pay for more work" and even less mention of "He who does not work does not eat." Thus, "From each according to his ability, to each according to his work" also seems to be nothing more than empty words.

Does the "iron ricebowl" have any supporters? Some, they are sluggards, those who do not strive to make progress, bureaucrats. The problem is in the reliance on this "iron ricebowlism," which is no different than the development of the flourishing mouth. The laborers' hands degenerate, socialism loses its abundant material base, it then exists in name only. At this level, our lesson is extremely profound.

I think that 80 percent of those who urge others "not to work so hard" are incapable of working that "hard" themselves. Today's Chinese who work diligently around the clock and quietly immerse themselves in hard work are not in the minority. However, there actually are those few people who not only do not "work hard," but also urge others not to "work hard," and some even take those who do "work hard" as fools! The reason these people do not "work hard" is that they find joy in their own way, and in addition to an awareness problem, objectively speaking, one big reason, is that they are given an "iron ricebowl" to carry.

It is said that in recent years, some foreign specialists, who have come to assist us in our industrial construction, place extreme emphasis on the system of a scheduled vacation at home. In addition to a reunion with family, the even more urgent objective of their vacations is to take an opportunity to understand and grasp the latest domestic and international scientific and technical achievements in their fields and keep abreast of the latest methods in order to avoid stagnation of their knowledge and lagging behind technically or even breaking their ricebowls. With these foreign scientists and technicians working so diligently and with their spirit of constantly improving, it is no wonder that it is not deeply pondered by those comrades who carry the "iron ricebowls" or "go by the sure fishing boat."

EMERGENCE OF NATIONALIST CAPITALIST INDUSTRIES LIMNED

Nanjing XINHUA RIBAO in Chinese 14 Aug 81 p 3

[Article by Wang Ke [3769 0668]: "The Emergence of China's Modern National Capitalist Industry"]

[Text] The seeds of capitalism were laid very early in the protracted period of the development of feudal society in China. China would have gradually entered into a capitalist society even without the invasion of foreign capitalism. Starting in 1840, foreign capitalism invaded China on a large scale which has changed the course of capitalist development in China. As a result, China progressively lapsed into a semi-colonial, semi-feudal society.

The first group of modern industries to emerge in China were not established by the Chinese people, but by the foreign capitalist aggressors. Following the Opium War, the foreign capitalists, aside from launching an all-out effort to promote sales of their industrial products in China and plundering local products and specialities, ignored the sovereignty of China by presumptuously investing in manufacturing facilities. These plants were mainly for ship repairing and various processing industries. The former was to suit the needs of the development of the shipping industry in China (foreign steamships would need inspection and repair on their arrivals), and the latter to suit the need of processing raw materials and local products and specialities pillaged from China. For instance, in order to rob eggs, they first had to process them into egg powder and then to ship the powdered eggs out. For this reason, they established powdered egg plants. According to statistics, from 1843 through 1894, some 100 plants of various sizes including ship repairing, brick tea, silk reeling, sugar refining, egg powder manufacturing, cotton ginning, printing, packing, match, cigarette, ironware, and so forth were established by foreign capitalists.

Modern industries operated by the Chinese themselves started some 10 years later than that of the foreigners. The first modern industries set up by the Chinese people were not civilian industries operated by private individuals, but the armament industry operated by the government. In the course of putting down the Taiping Revolution, the feudal overlords, witnessing the devastating effectiveness of Western weapons, spent funds from the state treasury to set up modern arsenals mainly for the purpose of fighting against people's uprisings. The first arsenal, the "Anqing Armament Plant," was set up in 1861 by Zeng Guofan in Anqing. From then to 1894, a total of around 20 arsenals were established by the government of the Qing Dynasty, of which the Jiangnan Manufacturing Bureau in Shanghai, the Tianjin Machinery Bureau in Tianjin and the Fuzhou Shipyard in Fuzhou were comparatively larger in scale. In Nanjing, we also had a Jinling Manufacturing Bureau. With the initiation of the armament industry, it was necessary to develop such supporting industries as mining, smelteries and transportation. At the same time, more capital was needed. Therefore, high-ranking bureaucrats of the Qing government established some industries for civil use and absorbed some capital from the private sector. As a result, modern civilian industries either operated directly by the government, or "supervised by the government and run by merchants," or jointly operated by the government and merchants emerged. In 1872, Li Hongzhang set up the China Merchants Steam Navigation Company which was operated directly by the government under the arrangement of "government supervisory, merchant operated." At the initial stage, government shares of this company totaled 1.9 million taels, while that from private sectors totaled 0.73 million taels. According to statistics, up to 1894, there were a total of 30 civilian enterprises either operated by the government, or supervised by the government and undertaken by merchants, or jointly operated by the government and merchants.

China's national capitalist enterprises did not come into being until 1872. It is generally felt that China's first modern national capitalist enterprise was the Jichanglong [4949 2490 7127] Silk Reeling Plant in Nanhai, Guangdong. It was a plant operated by an overseas Chinese who returned to China to make this investment after he had seen silk reeling plants abroad operated by foreigners were very lucrative. Another enterprise, the Fachang [4099 2490] Machinery Works in Shanghai started to utilize machinery earlier than 1873. In 1878, another mechanized flour mill, the Yilaimou [6318 0171 3664] Flour Mill owned by our own nationalist capital emerged in Tianjin. In the 1870's, plants set up with China's nationalist capital totaled about 20 in number and that number increased gradually in the 1880's. Up to 1894, there were more than 70 plants including such industries as silk reeling, cotton ginning, cotton textiles, flour, match, paper, printing, mining, public utilities, and so forth.

As far as China's national capitalist enterprises are concerned, not only did they come late as compared with plants set up by foreign capitalists as well as those established by the Qing government, their financial strength was also smaller. For instance, the Johnson Shipyard invested by foreign investors had a capital of 800,000 taels, the Jackson Shipyard had a capital of 750,000 taels, while the Baochang [1405 2490] Silk Mill had 800,000 taels. The capital of the China Merchants Steam Navigation Company which was supervised by the government and run by merchants was more than 2.5 million taels and that of the Shanghai Weaving Bureau came to nearly 0.7 million taels. The capital of each national capitalist enterprise was generally less than 100,000 taels. The biggest single investment among them was only around 200,000 taels.

The plants set up in China with foreign capital were supported by the influence of the foreign capitalist aggressors and that operated by the government or jointly operated by the government and merchants were supported by the feudal influence in China. However, plants operated by China's nationalist capital were inhibited by both of these influences. To compare 1894 with the year of 1864, the net value of foreign goods imported into China increased 4 times, which became the most serious obstacle to the development of our nationalist industries. Moreover, foreign capitalist enterprises relied on special political privileges, powerful financial strength and advanced skills to directly compete with China's nationalist industries. Many of our plants financed by nationalist capital were forced to close down under the competition of foreign products and foreign plants. The Chinese feudal bureaucrats utilized their political power and influence to monopolize various industries and to inhibit the development of the national capitalist enterprises. While Li Hongzhang set up the Shanghai Weaving Bureau, he presented a memorial to the throne requesting the emperor to cut taxes and grant 10-year patent right so that "within the next 10 years only the Chinese merchants are allowed to add shares to the Bureau and no new bureaus will be permitted to establish."

Aside from the fact that the national capitalist enterprises were suppressed by both foreign capitalism and domestic feudalism, they, on the other hand, also relied on both of them. Investors of some national capitalist enterprises were compradors themselves. These enterprises also had to purchase machineries and certain raw materials and engage technicians from abroad. Some enterprises were even indebted to foreign banks. Still other investors of some of these nationalist industries were themselves bureaucrats or landlords. They requested the Qing government for support and to cut taxes. China's national capitalist industries found it hard to develop without relying on foreign capitalism and domestic feudalism.

China's modern national capitalist industry was on the one hand oppressed by foreign capitalism and hampered by domestic feudalism, and on the other hand it did not cease its link with both foreign capitalism and domestic feudalism but on the contrary relied on them to develop. This dual nature was manifested at the very beginning of the emergence of China's modern national capitalist industry.

WEIHAI PROMOTES CONSTRUCTION OF RURAL TOWNS

Jinan DAZHONG RIBAO in Chinese 22 Aug 81 p 1

[Article by Ning Yunjiu [1337 6663 0036] and Jiang Shiting [1203 0013 1694]: "Weihai Municipality Achieves Remarkable Successes in Strengthening Construction of Rural Towns"]

[Text] Remarkable successes have been achieved by Weihai Municipality in carrying out programs to integrate the city with villages for promoting progress in the rural areas, actively developing commune and brigade enterprises and strengthening construction of rural towns.

In Weihai Municipality, agricultural population accounts for 80 percent of the total population of the municipality. Each farmer has an average of 0.77 mu of cropland. In order to open up a new path for carrying out construction, the city party committee has since 1970 suggested that the superior features of the comparatively more flexible human, financial and material resources in the collective economy should be brought into full play and enterprises under collective ownership should be vigorously developed. In order to accelerate the rate of urban industrial development, solve the problem of the shortage of industrial workers in the city, and at the same time prevent the city from over-expanding, the city party committee has spread the experience gained by the First Carpet Plant in integrating workers with peasants and the city with rural areas, and in diversifying products in rural areas to promote the development of commune and brigade industries. In 1975, when responsible comrades of the provincial party committee conducted an investigation in Weihai Municipality, they affirmed this experience. They pointed out that it is the right approach to engage in urban-rural as well as worker-peasant integration and to diversify products. It is necessary to build the seats of communes into small towns. With the support of the higher authorities, the city party committee has strengthened its confidence and set up a Commune Industrial Bureau to organize various communes to do a good job in planning the construction work of rural towns. Since then, commune and brigade industries as well as the construction of small rural towns have taken on a new aspect. Especially since the 3rd Plenary Session of the 11th CCP Central Committee, the pace of the construction work of 6 towns of the municipality and the rate of development of enterprises operated by communes have been greatly accelerated. In 1976, the output value of commune industries in the whole municipality reached 8.73 million yuan and profits reached 1.97 million yuan which increased 87.8 and 51.1 percent respectively compared with that of the previous year. In 1977, the output value reached 16.12 million yuan and profits 3.35 million yuan, an increase of 84.7 and 70.3 percent respectively compared with that of the previous year. In 1980, the output value of commune industries of the whole municipality reached a new high of 27.72 million yuan and profits reached 4.51 million yuan, an increase of 10 and 24.1 percent respectively compared with that of 1979.

Since the program for developing commune and brigade industries was put forward in 1970, Weihai Municipality has undergone three different stages from initial probing to planning to construction. The development of commune and brigade industries enabled 6 rural suburban communes of the whole municipality to accumulate large funds for the construction of rural towns. New enterprises have been set up one after another. Factory buildings, buildings for accommodating sales departments and administrative units as well as dormitories also have been completed. These towns have gradually become political, economic and cultural centers in rural areas and thereby serve as links and bridges between Weihai municipality and the rural areas. According to incomplete statistics, investment made by various communes of the whole municipality for town construction totaled more than 20 million yuan. The investment made in each town averaged 3 million yuan. At present, more than 70 industrial enterprises have been set up in these towns by communes only recently aside from such units as supply and marketing cooperatives, banking offices, credit cooperatives, tax bureaus and grain bureaus which have already been there. Among the industrial enterprises, there are 56 factories, 6 communication and transportation stations and 6 engineering contractors. There are also 41 service industries including 6 sales departments, 13 restaurants, 4 hotels, 6 photo studios and 6 barbershops. The collective income of these industries and services totals 37.52 million yuan, with an average of 5.36 million yuan going to each commune. At the same time, the number of cultural and entertainment facilities also have gradually increased. There are now 6 cultural centers, 5 libraries (study rooms), 2 movie theatres and 5 middle schools in 6 towns.

Owing to the fact that the construction of rural towns is based on the enterprises operated by communes, it has given an enormous impetus to the city industries. In 1980, the aggregate value of industrial output of the whole municipality reached over 360 million yuan which increased 4.5 times compared with that of 1970. At the same time, it has helped to reduce expenditure and increase revenue of the state and thereby preventing the city from heading toward lopsided overdevelopment. At present, commune and brigade plants in rural areas of the municipality as a whole have more than 8,400 people doing processing work for city industries as "staff members working outside of the plants." These people amount to 60 percent of the existing permanent working force in the city itself. In 1980, commune and brigade enterprises centered at rural towns paid 1.57 million yuan in taxes directly to the state. Furthermore, the development of industries centered around rural towns has brought about a booming rural economy and promoted rural construction. At present, in rural areas all over the municipality, each brigade has an average of 4 enterprise projects. Since 1975, more than 15,000 houses have been completed which account for 35 percent of the total number of households in rural areas. The total construction area is 720,000 square meters and each individual farmer has an average area of 4.4 square meters. The rise of rural towns has helped to make things convenient for the masses and liven up the rural economy.

FOREIGN INFLUENCES NOTED IN SOCIALIST MODERNIZATION

Guangzhou YANGCHENG WANBAO in Chinese 12 Aug 81 p 2

[Article by Liao Jianxiang [1675 1696 4382]: "A Bold Exploration of the New Relaxation of Restrictions on Things Foreign"]

[Text] The Party Central Committee has decided to implement special policies and take flexible measures in the two provinces, Guangdong and Fujian. This was a great economic policy decision following the Central Committee's Third Plenary Session. The practice in the two provinces during the last 2 years shows that the implementation of this decision has not only brought about obvious results in the economic development of the two provinces, but has also created new experiences and explored new approaches to economic system reform and development of our socialist economic construction. It holds very great significance.

The meaning of the special policies and flexible measures can now be summarized as the three "relaxations," i.e. the relaxation of policies directed abroad, the relaxation of domestic restrictions and the relaxation of authority over the lower echelons. The one outstanding point among them is the even greater relaxation on things foreign.

Speaking from the viewpoint of socialist ecnomic construction this relaxation on things foreign is a sweeping reform. From the viewpoint of economic development, this relaxation is a developing country following a modern strategic choice and an important policy. If this work is to be carried out well, we must continue to liberalize ideas, improve awareness, and give emphasis to summarizing histroical experiences.

During the past 2 years, the Province of Guangdong has accumulated some significant experiences in running a pilot special economic zone and in the implementation of the special policies and flexible measures, and has discovered some new problems to be solved. We must experiment boldly, advance steadily and seek a new approach.

1. The relationship between special policies of the two provinces and the overall national situation should be handled properly. Guangdong's relaxation on things foreign must be truly "special," truly "flexible," and truly "advanced" properly to solve the problems of domestic policy relaxation and broadening of local authority. Otherwise, they will be neither "special" nor "flexible." In this

instance, the problem of the relationship between the overall national situation and the local areas must be handled well. The "special" policies are to create experiences for Guangdong Province in order to give impetus to the entire nation. Of course, the special policy cannot have an unfavorable impression on the overall situation. For example, economic development plans and foreign trade export programs should be under the direction of a unified national plan and, with the provinces as the dominant factor, the pieces put together giving local levels their rightful sovereignty. Of course, export trade should be integrated under one set of foreign policies to avoid giving foreign businesses an advantage. We cannot force prices down domestically or else the profits will flow out of the country. Full play should also be given to local enthusiasm in commodity flow, however, it should serve the unified national plan. Exports outside the plan should be handled by the province alone. Past experience has shown that regulating things to death and reining in too tightly with various procedures affects the implementation of special procedures and is a great problem which must be solved conscientiously.

2. Utilize favorable local conditions to select the form of economic and technical cooperation. Currently, several methods using foreign capital in the development of economic and technical cooperation have been adopted. Such methods as finished product processing, compensatory trade, joint venture, and joint production have shown obvious results. We still must very carefully summarize the experiences of how to take local conditions and characteristics into consideration when selecting from the different projects the one which will be the most favorable to the development of the enterprise and most favorable to both sides in achieving equanimity and mutual benefit. In some cooperative projects, once put into operation, raw materials, power, transportation, and sales all flow normally and production expands to the benefit of both sides. However, in some projects, problems of raw materials, wages, capital interest, profit splits, equipment compensation, etc. are not properly resolved creating abnormal production, unequal profits, and few material benefits. In the future, emphasis should be given to summarizing these experiences and solving this problem.

3. The construction of the special economic zone must be done well. In 2 years of construction on a special economic zone, great achievements were realized and we initially tried to gain experience. For instance, the comprehensive special economic zone in Shenzhen established various businesses in industry, trade, agriculture, livestock, housing, and tourism; the Zhuhai special economic zone takes tourism as its primary industry; and the city of Shantou will use foreign capital to rebuild old buinesses and develop a special economic zone which relies on export processing, tourism, and other industries. These situations all comply with the theory of implementing plans in line with local conditions and the principle of striving for substantial results. The urgent problems currently requiring solutions are: How do you enact the total social, economic development plan for each of the special zones? How can the construction of basic installations be hastened to solve the problems of power, water supply, communications, factory buildings, roads and transportation in order to provide various services and facilities for economic development? How can various preferential policies be enacted to attract the capital of foreign investors and draw in technology? How to enact economic legislation and regulations on labor, contracts, insurance, customs, tax revenue, etc. relevant to the speical zones? How to revise swiftly the tedious entry and exit procedures for the zones to achieve a simplified procedure, improving efficiency and making entry and exit from the zones convenient? Currently there

are over 350 different kinds of special economic zones in the world (including the socialist nations of Yugoslavia and Romania, the wealthy capitalist nations of the Netherlands and the United States, and the developing countries, Singapore, Pakistan, and others). All of these nations have gone through the work of constructing special economic zones. Our special economic zones are a place to come into contact with foreign entrepreneurs. It is also the best place for foreign business circles to observe our special policies and flexible measures. Foreign investors will display their economic management experiences in the special economic zones. We must try to find new approaches and experiences here.

4. We must improve research in international economic and technical information and international markets. Our socialist economic construction will be gradually closer to the changing relationships of the international economy. We have the necessary research organizations to assemble international economic/technical information and gradually to establish specialists and a strong computer retrieval system. We can grasp international economic trends, develop markets, and make economic forecasts to provide the basis for foreign economic activities allowing us to take the initiative in such activities facilitating even greater achievements.

We already have an excellent beginning in relaxing the restrictions of the strategic measures for the economic development of the socialist modernization and the victorious prospects are inspiring.

CAUSES OF POLAND'S ECONOMIC PROBLEMS ANALYZED

Kunming JINGJI WENTI TANSUO [INQUIRY INTO ECONOMIC PROBLEMS] in Chinese No 3, 81 pp 75-79

[Article by Xu Guihua [1776 2710 5478]: "An Analysis of the Economy of Poland"]

[Text] The strike which swept over all of Poland in July 1980 attracted great attention throughout the world. This incident had a significant political and economic background as well as deep historical roots. Here let us analyze its economic causes.

Same Old Stumbling Block

This strike was touched off by the Polish Government's decision to raise meat prices.

Everyone who is familiar with conditions in Poland knows that several labor disputes in Poland in the past were attributed to the increase in commodity prices, mainly the prices of foodstuffs and meat. In the mid-1950's--or, to be exact, in 1956--as we recall, the Polish Government, then confronted with economic difficulties, adopted measures to restrict consumption and raise commodity prices. This resulted in the Poznan incident. In December 1970, the Polish Council of Ministers again decided to raise the prices of 46 types of foodstuffs and daily necessities, thus increasing the cost of living of each household by 20 percent. On the day following the announcement of the price hikes, the workers at the Gdansk Shipyard started a strike which later spread to Gdynia, Sopot, and Szczecin. In June 1976, the Polish Government again announced an increase in the retail prices of certain commodities (mainly foodstuffs) by an average of 39 percent. The price of meat was increased 70 percent. News of the price hike led to another strike which threatened to engulf the whole country. Sensing trouble, the government rescinded its decree 24 hours after the announcement, and the price hike was declared null and void. The situation then calmed down. The [strike] in July 1980 was already the fourth general strike. Why is the question of price hikes--for foodstuffs and meat in particular--so delicate and sensitive in Poland? Why should the Polish leaders continue to hit the same old stumbling block? These questions should be carefully analyzed and explored.

For a long time there has been a scarcity of consumer goods in the Polish market, while price fluctuations and currency inflation have now assumed serious dimensions. In recent years, the decline in production caused a shortage of supplies accompanied by price hikes and currency inflation. This has added to the people's discontent. According statistics, the Polish people spend on meat and foodstuffs 50 percent of their total expenditures for daily consumer goods. Therefore, an increase in the prices of foodstuffs and meat is not only a matter of concern for the households but also has a strong impact on the broad masses. The contradictions on this score are as a rule particularly serious. In the case of meat, for example, the contradiction between supply and demand in recent years has been intensified, we may say, to an intolerable extent. The latest price hike was a 60-percent increase for more than 20 kinds of meat. There was neither previous consultation with the masses nor any attempt to explain to them the difficulties. Therefore, the announcement of the price hike was like the igniting of an explosive, and it was followed by a sudden outburst of the people's long-suppressed anger. As a West German weekly journal put it, "The workers were indignant when the increase in meat prices was announced by the government. Now the indignation has been transformed into action, and this is no surprise at all."

Polish Government leaders have tried to ease the tense economic situation by reforming the economic system. Since the relationship between economic readjustment and economic reform was not handled well, the shortage of supplies in the market became even more serious. Since the beginning of 1973, Poland has begun to reform its economic system and to practice the so-called "new economic system," the main purpose of which has been to decentralize and delegate more power to the lower levels. However, instead of treating economic readjustment as an urgent task in dealing with the various national economic imbalances, the Polish authorities promoted the so-called "new economic system" as their foremost concern. This resulted in new chaos in the national economy. As a U.S. scholar said: "Instead of easing economic tension, the reform was frustrated by this tension."

To ease the contradictions, the Polish Government has often adopted the method of freezing prices and raising wages. Thus, every upheaval has been followed by a substantial wage increase. From 1950 to 1955, there was an average annual increase of 4 percent; from 1956 to 1957, it sharply increased 20 percent. Similarly, from 1960 to 1970 the average annual wage was increased by 1.8 percent, and from 1971 to 1972 it again sharply increased 22 percent. As an article in the British quarterly journal SOVIET STUDIES said: "Increasing wages for political reasons not only makes the market more unbalanced (because of currency inflation), but also creates difficulties for economic reform," because "a double logic (of winning popularity and showing an appreciation of value) on the question of distribution can bring economic reform to a standstill." This shows that liberal promises and substantial wage increases will in the long run increase economic difficulties and exert greater pressure on the market. This will lead to another cycle of intensified contradictions.

Decline of the "Granary of Europe"

In November 1979 a Hungarian research worker, comparing Hungary with Poland, said: "Agricultural development is of very great significance. For several years we have overcome various difficulties without too much effort, for the important reason that our market supply is good. Poland is different. Instead of solving any problems, price hikes have on two separate occasions caused great trouble. Meat prices have been raised three times in our country without bringing about any important political change. Therefore, agricultural development is a very important political issue."

These words are very significant and to the point. In Poland, many labor disputes have been caused by meat and foodstuff price hikes, for the important reason that the market supply has not been under control. In the final analysis, the failure of agricultural development is the root cause.

Poland originally was an agricultural country. In view of its favorable conditions for the development of agriculture and animal husbandry and its rich agricultural regions, people commonly called it the "granary of Europe." However, because of its economic policies and its entire economic structure, agriculture there is still very backward, compared with not only the developed capitalist countries but also with the [other] East European countries. The "granary of Europe" of the past is now in a decline.

Since the abolition of cooperatives (approximately 90 percent of the total number) by Gomulka in 1956, agriculture in Poland has been dependent on dispersed and narrow individual farming households. By 1978, according to statistics, only 23.3 percent of the farmland was publicly owned; the remaining 86.7 percent belonged to individuals. In other words, more than three quarters of the farmland belongs to individual peasants. The ratio of individual economy in cattleraising and livestock production is even higher. In 1978, 85 percent of the pigs, 74 percent of the oxen, 89 percent of the milk cows, and more than 97 percent of the horses were owned by individual peasants. Individual farming households produced 65 percent of the meat, more than 85 percent of the milk and some 92 percent of the eggs. The public sector of the economy in Poland's agriculture is not only small but also inefficient. The state invests heavily in the public economic sector, but there is also serious waste. On the whole, its business results are not as good as those of private farming households. According to statistics, the average amount of fodder and fertilizer used by state farms is two and a half times higher than that used by individual peasants. A Polish journal has said: "If the amount of grain used to produce 1 kilogram of meat by the public sector of agriculture were the same as that used by individual peasants, we could have more than 2 million tons of grain, worth 300 million dollars, each year." Yet individual farming is now on a gradual decline because of its extreme decentralization. According to a news report, since "the majority of young people are not interested in their parents' farms" nowadays, many crops are grown "in an idyllic way by old people of 70 with grey hair. This is far behind the use of modern harvesting tools in efficiency."

Within the agricultural sector, the serious effects of an imbalance between farming and animal husbandry has caused livestock prices to soar. In the past 10 years, the price of livestock procurement was raised by 120 percent, but even by 1978, meat prices had been frozen at the same level throughout the years. Thus the state had to spend a huge amount on subsidies. In 1978, an average of 34.4 zlotys was granted for each kilogram of meat sold. The total subsidy of 91.4 billion zlotys each year was equivalent to 11.2 percent of the workers' wages. In 1980, the total subsidy for meat and other staple food amounted to 200 billion zlotys; this subsidy alone accounted for 20 percent of the government's budgeted expenditures. This is quite a heavy burden for the government. To reduce this burden and ease financial tensions, a price hike was the only way out. This was exactly the cause of the price hike in July 1980.

Shadow of "Economic Synchronization"

Apart from its extremely backward agriculture, one of the causes of the shortage of market supplies in Poland has been the "economic synchronization" of CEMA, with the Soviet Union as the overlord, which casts a dark shadow over the Polish economy. Under this dark shadow, Poland had to unilaterally strive for the development of heavy industry, mainly the processing industry, at the expense of raw materials, fuel, power and other basic industries, and the light and food industries required for domestic consumption. This "economic synchronization" consolidated Poland's irrational economic structure (or the so-called heavy structure) and thus landed Poland in a predicament from which it could not extricate itself.

According to the requirements of "economic synchronization" and specialization, Poland, as a member nation of CEMA, is charged with the responsibility of producing ships, railroad cars, construction machinery, roadbuilding machinery, textile machinery, lathes, selected items of the electric and electronic industries, and complete sets of equipment for sulphuric acid plants, sugar refineries, and papermills, in addition to elements and parts to be used for the production of motor vehicles. Such is the duty of a CEMA member, and every effort must be made to ensure the development of these processing industries in order to meet export requirements. Thus the production of all light industrial goods urgently needed at home were simply discarded. This was one of the important causes of the short supply of daily consumer goods in the home market.

Poland's exports to the Soviet Union consist mainly of various types of finished goods and food. It is true that there has been a certain development in Poland's food industry in recent years, but the market supply situation has not been correspondingly improved, simply because, in the Polish people's own words, these products are "taken away" by the Soviet people. A press report from Moscow said: "Polish consumers will be very unhappy if they know that, while many items of f od can rarely be seen in Polish stores, the stores are full of food items produced in Poland." In August 1980, the Yugoslav news agency dispatched a report from Warsaw saying: "Meat is now very scarce in Poland. Actually, it is more scarce now than ever, because Poland has to keep its miserably low stock for donation to the Olympic event to be held in Moscow. The long lines of prospective customers before the meat stores, which has been a common sight, have become longer than ever."

Fact has shown that the dark shadow of "economic synchronization" over Poland has intensified the lopsided development of Poland's industry and industrial structure and has subjected its market supply to double pressure: On the one hand, its light and food industries, which should be capable of meeting domestic needs, are far from adequate for the continually growing social demand; on the other hand, it must further curtail its already short supplies for domestic consumption in order to meet export requirements--mainly the requirements of the Soviet Big Brother"--failing which, domestic production can hardly be maintained. The West German DIE WELT said in a news report: "Should the supply of oil from the Soviet Union be discontinued, the wheels of Poland will grind to a stop." This should be a good lesson for us: A country should abandon the policy of shutting itself behind closed doors and should actively participate in the international division of work, so as to bring into play its own economic strongpoints and at the same time strengthen and develop its international economic contacts. However, it must also uphold the principle of independence and self-reliance, assert its own sovereignty, and hold the initiative of economic development in its own hands. Otherwise, it will bring untold misery to the state and the nation.

Results of "New Economic Strategy"

"Ice 3 feet in depth cannot be the result of one cold day," goes an old saying. The recent strike in Poland and the economic difficulties now confronting it are the inevitable outcome of the so-called "new economic strategy" carried out over the past 10 years.

In the early 1970's, the strategy of social economic development, also called the "new economic strategy," introduced by Gierek called for the "realization of a second industrialization" and the "rebuilding of Poland" in the 1970's. Accordingly, he put forward the "three highs" policy, meaning high speed, high wages, and high fringe benefits, as a means of "safeguarding high-speed national economic development, suitable improvement of the people's living conditions, and marked improvement of social production."

In the first half of the 1970's, the "new economic strategy" did produce certain good results. For example, from 1971 to 1975 the per capita national income of Poland increased by 9.8 percent annually. The generally high rate of increase gave rise to a "speedy parallel increase of wages and investment rarely seen." However, this fine situation did not last long. In the second half of the 1970's, there was a sharp drop in production. Some large-scale readjustment had to be made in investment, and the actual increases in wages became almost negligible. By 1979, the national income did not increase at all, and compared with the previous year, there was even a 2-percent reduction. Investment was reduced by 8.2 percent, while actual wages increased by only 1.8 percent. The so-called "three highs" had already vanished into thin air. As proved in practice over the past 10 years, the "new economic strategy" has ended in failure.

First, this "strategy" was based on large foreign loans. In February 1970, Gierek, who had been in office barely 2 months, proposed the so-called "active loan policy" before the Eighth Plenum of the Fifth Central Committee of the Polish United Workers Party and advocated large-scale borrowing from foreign countries. In 1970, Poland had 800 million dollars in foreign debts; by 1979 the amount had sharply increased to 19.4 billion dollars, and then to more than 20 billions in 1980. According to present announcments, it has already exceeded 23 billion dollars. It is generally agreed that the foreign debts of a country will reach the "dangerous limit" if the total amount of capital to be repaid, along with the interest, exceeds 25 percent of its total volume of exports or its total foreign exchange earnings. In 1979, Poland had to spend 4.1 billion dollars to repay its foreign debts plus interest. This amount was equivalent to 56 percent of its income in hard currency from exports to the West, and was far beyond the "dangerous limit." In 1980, the amount of debts and interest paid was 8 billion dollars, or equivalent to 130 percent of the total volume of exports to capitalist countries. From this we can see that Poland's foreign debts have far exceeded its capability for repayment.

Secondly, the "policy of active importation of technology patents" was actually a rash action taken on the spur of the moment and was inconsistent with the actual situation. This grandiose scheme brought about grave consequences. To carry out the strategy of "high-speed economic development," Poland formulated a "policy of active importation of technology patents" in 1971. As soon as this policy was adopted, all departments, including some plants and enterprises, joined the scramble for imports, regardless of their actual needs or their capability to repay. From 1971 to 1976, according to statistics, Poland imported from the West more than 280 large projects and some 400 technology patents, altogether costing more than 26 billion dollars. The scope, quantity, and expenditures involved were appalling. First, because of the limited technological force, construction capability, basic installations, and ability to undertake auxiliary projects at home, the construction period for these new projects had to be prolonged a great deal. The construction period for 60 percent of these imported projects was more than 3 years, and some of them became "bottomless holes" for investment. Secondly, because of ignorance of the general situation and technical conditions, many items were imported blindly. Thus, one-third of the imported technology patents were simply shelved instead of being put to use. In the chemical industry departments, 30 percent of the patented equipment could not be used because of wrong choices at the time of purchase. Thirdly, approximately one-third of the imported projects depend on the import of raw materials for production. Because of the continued increase in raw material prices on the world market and the lack of assurance of raw material supplies, a number of newly built plants and enterprises had to stop operation. Furthermore, approximately one-quarter of these projects either could not start operation or failed to acquire their originally designed productive capacity because of inadequate power supply or transportation difficulties. Fourthly, for various reasons, the majority of imported equipment or patents were originally not quite up-to-date, and after several years of construction their competitive power had greatly diminished by the time they were ready for operation. Of the imported-patent products, according to statistics, only 10-14 percent were up to the world standard, and there were very few "commodities that could maintain their foothold on the market."

Moreover, the so-called "speedy parallel increase" of high accumulation and high consumption has led to overall national economic tensions and serious disproportions. From 1956 to 1970, according to statistics, the rate of accumulation was consistently kept at 19.5 to 26 percent, and from 1971 to 1975 the average annual accumulation rate was as high as 37.5 percent. In the same period, the average annual increase in consumption was 9.2 percent, while social welfare funds were increased a great deal to provide free medical care for all the people. The peasants also began to enjoy the benefits of a retirement system. All these commitments were beyond Poland's national economic capacity and further aggravated the already disproportionate relationship.

The "Poverty" of Political Economy

An article in the Japanese SENTAKU [SELECTION] No 10, 1980, pointed out: "Frankly speaking, the problems now uncovered in Poland are neither purely political nor purely economic but are problems of socialist political economy, which is a close combination of the two. According to Marx, they are created by the 'poverty of political economy'." This shows a keen insight. There has long been a common saying in Eastern Europe that Poland has good economists but not a good economy. The reason is that the Polish Government does not regard economic theories highly and fails to apply Marxist socialist theories of political economy to guide domestic construction. Nor does it respect the objective laws of socialist economy, and even less does it follow objective economic laws. That was how it continued to repeat errors in practice and found itself in economic difficulties.

Recently, Poland's new leader, Kania, expressed his intention to ponder the experiences of the past 10 years and to draw lessons from them, so as to "ensure that a repetition of the same errors that led to the present crisis will never happen." At the same time, he adopted a series of measures to solve the immediate problems. This is certainly fine. We hope he can truly draw lessons from past mistakes, carry out thorough economic and political reforms (that is, the practice of economic and political democracy), and then gain better prospects for economic development.

GENERAL

BRIEFS

LIAONING SMUGGLING CASES--In the January-August period, the Dalian customs office, Liaoning Province, cracked 470 smuggling cases and confiscated contraband goods worth over 510,000 yuan. Some 79 cases involve illegal business transactions among enterprises' staff and workers inside and outside the province. OFFICIALS REVIEW STATUS OF BAOSHAN STEEL COMPLEX

OW270412 Hong Kong AFP in English 2328 GMT 26 Sep 81

[Article by Charles-Antoine de Nerciat]

[Text] Baoshan, Eastern China, 27 Sep (AFP)--An additional sum of more than one billion dollars will have to be invested in the gigantic Baoshan steel complex near Shanghai before it can begin functioning, a construction official said.

Nearly three years after building work started on the complex, the officials in charge remain uncertain about when production will start.

One high construction official at Baoshan indicated yesterday that two billion yuan (1.17 billion dollars) would be needed to complete the first phase of this big Sino-Japanese economic cooperation project including construction of a blooming mill, a blast furnace and electric power plant.

The official, Fang Hesheng, said that since construction began in December 1978 with a big contribution of Japanese capital, two billion yuan had been spent. This covered only 40 percent of the first phase of the project, 25 kilometers (15 miles) north of the big port of Shanghai.

Plans for a second phase, including additional rolling mills and another blast furnace, appear to have been practically abandoned. It was to be built with the aid of American, Japanese and West German capital.

"Technically, we should be able to complete the first phase two or three years after the original target date of 1982," said Mr Fang. But he added that he was not able to specify when this work would be finished.

"That will depend mainly on the investment that is made and the conditions of the current readjustment of the Chinese economy," he told newsmen.

A tentative agreement has just been concluded between China and Japan for Japanese loans totaling 1.3 billion dollars. In exchange, China agreed to continue economic cooperation projects between the countries that were threatened with cancellation, including Baoshan, the biggest project.

But the means of putting the agreement into effect have not been set. Mr Fang underscored that he did not know how much of the loans would be devoted to Baoshan.

But he affirmed that the electricity generating station would be finished during the second quarter of next year and that funds for this have already been allocated. It will be able to produce more current than needed by the steel complex alone.

The official rejected criticisms that have been made about this controversial project, especially concerning its site on marshy ground near the mouth of the Changjiang, China's longest river.

Those in charge are relatively vague concerning the conditions under which the construction is being done by some 60,000 workers. Newsmen visiting the building site spread over 12 square kilometers (4.55 square miles) saw only a very limited number of workers.

"There is much work going on at certain times, but less at other moments," Mr Fang commented. "It is difficult to specify exactly how many workers are on the site now."

The original estimate on the overall cost of the two planned phases made by Nippon Steel Corporation was 5.5 billion dollars.

Preliminary studies were carried out in one year. At least three times as long should have been allowed for the studies, noted another construction official, Xu Bangding.

The men in charge now stressed that the 1982 date set for the start of steel output "was not realistic."

"If we receive funds next year we will carry on our work," Mr Xu added. But he said he was now confident that phase one would be completed.

TAIWAN SHIP SURVEYS SENKAKU UNDERWATER RESOURCES

OW280547 Naha OKINAWA TIMES in Japanese 28 Sep 81 Morning Edition p 1

[Text] It was disclosed on 27 September that, at a time when the development of seabed resources around the Senkaku islands is being disputed [by Japan, China and Taiwan], a Taiwan resources exploration ship, the "Wodeco," had anchored about 61 km west of Uotsuri Shima [Tiaoyutai in Chinese] of the Senkaku islands and surveyed seabed resources for approximately 1 month.

Since the Taiwan exploration ship had anchored about 5.5 km inside the Japanese side of the East China Sea from the center line between Japan and Taiwan, the Japanese Government requested Taiwan to withdraw the ship. However, the Taiwan side answered the request by dispatching a warship and military aircraft. This was confirmed by patrol boats of the 11th Regional Maritime Safety Headquarters.

According to investigations conducted by the 11th Regional Maritime Safety Headquarters, the "Wodeco" carried out exploration work together with two work boats, taking up moorings since about the middle of August. It went back to Taiwan temporarily when Typhoon No 18 drew near but returned to the area and resumed work on 3 September.

Although the "Wodeco's" location was not within Japan's territorial waters but in the open sea, it is international custom to regard the center line as the borderline when two neighboring countries cannot agree on their respective 200 nautical mile economic zones. However, when the Japanese Government asked that the Taiwan ship withdraw from the center line, the Taiwan side responded by dispatching a warship and two fighter aircraft.

Violations of territorial waters by Chinese and Taiwan fishing boats around the Senkaku islands have occurred in the past, but this was the first time that a warship adn fighter planes were dispatched to support resource exploration.

The 11th Regional Maritime Safety Headquarters dispatched the 1,000-ton-class patrol boats "Yonaguni," "Motobu" and "Hateruma" to the area to watch the activities of the Taiwan exploration ship.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

'JINGJI YANJIU' ON STUDYING CCP RESOLUTION

HK131313 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 8, 20 Aug 81 pp 3-14

[Excerpts of remarks by Dong Furen [5516 6534 4356], Wu Baosan [1566 1405 0005], Wu Chengming [0702 2110 2494], Tian Jianghzi [3944 3068 3189], Liang Wensen [2733 2429 2773], and Pei Junsheng [5952 0193 3932]: "Seriously Study the 'Resolution' to Promote the Study of Economic Theory--Excerpts of Remarks of Some Researchers of the Institute of Economics of the Chinese Academy of Social Sciences in Forum on Studying the 'Resolution'"]

[Text] Editor's note: After the publication of the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC," some researchers of the Institute of Economics of the Chinese Academy of Social Sciences held a forum on 10 and 11 July to freely express their thoughts on studying the "resolution." The forum was presided over by Comrade Xu Dixin. Participants in the forum were enthusiastic in airing their views and the meeting proceeded in a lively atmosphere. The participants all professed their determination to support the "resolution." They also said that they will continue the in-depth study of the "resolution" and promote the study of economic theory, in order to better serve the needs of the building of socialist modernization. The following are excerpts from remarks made in the forum. [End editor's note]

Dong Furen: Develop Economic Science by Combining Theory and Practice

The "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" is a great historic document. By scientifically summing up the experience in socialist revolution and socialist construction, it clearly points out to the whole party and the whole people the direction of advance. The "resolution" is rich in content. Here, I will focus the discussion of my thoughts after studying the "resolution" on the correct road of socialist construction pointed out by the "resolution."

The "resolution" points out that the vital soul of Mao Zedong Thought, that is, its standpoint, viewpoint and method, includes three basic aspects: seeking truth from facts, the mass line and independence and self-reliance. Seeking truth from facts means proceeding from reality in everything, relating theory to reality and combining the general principles of Marxism and the concrete practice of the Chinese revolution. In terms of socialist economic construction, this means starting from the basic national condition, taking Marxist economic science as guiding thought and seeking a road to national economic modernization which is suited to our national condition. In this aspect, our party and Comrade Mao Zedong has made many explorations over a long period of time. After the 3d plenary session of the 11th CCP Central Committee, in its process of summing up positive and negative experience in socialist construction over the past 30 years, the party has put forth this question even more explicitly and has gradually found a correct road to socialist modernization which is suited to our national situation. The "resolution" concisely and incisively discusses this correct road. This is very meaningful. It does not only play a great guiding role in our economic work and the study of the economic theory, but also puts forth a series of issues which require further study for our economic workers and economic theorists. The study of these issues is necessary for the continued enrichment and improvement of the building of socialist modernization in the process of practice. It is also required for developing Marxist economic science by combining theory and practice.

First, we must do an in-depth study of our basic national situation. This is the starting point of socialist economic construction. As Comrade Hu Yaobang said: "To build a beautiful tomorrow, first, we must base ourselves on a relatively correct understanding of today's China. It is not true that we already know too much about China's national situation and the objective law of building socialism. The fact is, we know too little." Indeed, one of the main reasons why for a long time, leftist errors existed in our past economic work was that to a certain degree, we deviated from the national situation of our country and exceeded what was realistically possible. Today, we have acquired a clearer understanding of the basic national situation. However, we cannot say that the necessity of studying the national situation in depth has gained popular recognition. Furthermore, the study of the national situation cannot be done once and for all. We must constantly study our changing national situation with the progress of modernization. We must also see that in big, oriental country such as ours with a population of 1 billion, of which 800 million are peasants, a vast territory and very uneven economic development, not only is the overall situation extremely complicated, even regional conditions vary greatly. On the one hand, we must exert great efforts to study and master the overall and basic situation. This is undoubtedly very important for determining future economic development strategy. On the other hand, the study of the national situation must be conducted by having separate studies according to regions and sectors, in order to avoid over simplification and uniformity in giving guidance to economic work. We, economic theorists, must strengthen our study of the national situation.

Second, we must start from our basic national situation and proceed to study the overall strategic goal of the building of socialist modernization and the specific goals during each of its stages. Only thus can we make our socialist construction advance toward a unified and clearcut goal in a step-by-step manner and in stages and avoid detours as much as possible.

The central idea in determining the overall strategic goal and specific goals during various stages is to resolve the contradiction between the people's growing material and cultural needs and the backward productive forces. In order to gradually improve the people's livelihood on the basis of the continuous development of production, on the one hand, we must study the changes in our people's material and cultural needs as production develops and formulate a consumption model which is suited to our national situation; on the other, we must study how to take effective measures which are appropriate to the various stages and which vigorously develop productivity in order to satisfy the people's needs and better fulfill socialist production goals.

When studying and formulating the overall strategic goal and the specific goals in the various stages of achieving modernization, we must realize the spirit of doing things according to our capability while also actively engaging in struggle. The victory of the socialist revolution has brought out great enthusiasm among the broad masses of people to devote themselves to socialist construction. We must highly treasure the masses' enthusiasm for labor, bring into play our spirit of active struggle and make our socialist construction proceed in the best and fastest way possible. Of course, while bringing into play the spirit of active struggle, we must also proceed from objective reality and emphasize doing things according to our capability. We must see that we still have a weak economic and cultural foundation; we must see that our agriculture is basically done by manual labor, that agricultural productivity is very low, that some peasants lead a difficult life and that the living standard of the broad masses of urban and rural people is relatively low; we must also see that we have a big population which is growing too fast. These basic conditions dictate that our economic construction must proceed within the limits of our capability and that construction scale and growth rate must be compatible to national power. In the past, it was precisely because we one-sidedly emphasized human subjective initiative while neglecting objective economic conditions and one-sidedly emphasized growth rate while neglecting doing things according to our capability that socialist construction suffered losses. We must seriously remember this lesson.

Third, we must create concrete forms of socialist production relations which are suited to our national situation. Man's understanding of scientific socialism has gone through a very long process. When Marx and Engels formulated the theories of scientific socialism, they foresaw the basic features of future society through the analysis of basic contradictions of capitalism and discussed basic principles such as communist society is divided into two stages. These principles have great instructive value for our socialist construction. However, socialist systems have been established in specific countries. There are great differences in the national situations of various countries and thus socialist systems built in various countries have unique features and they cannot be completely identical. Furthermore, man's understanding of the socialist system can only gradually develop and improve in the practice of building socialism. Socialist revolutionary practice in our country tells us that we must correctly differentiate between the basic economic system of socialism and its specific forms. The basic economic system of socialism will be relatively stable during the entire historical period of socialism, while the specific forms must be constantly readjusted and even changes are necessary. On the premise of persisting in the basic socialist economic system, we must consciously reform those specific forms which are incompatible with the development of the productive forces and with the people's interests. The "resolution" pointed out that: "Our task is to create specific forms of production relations which are compatible with each stage and which promote continuous advance according to the requirements of the development of the productive forces in our country." This is a great issue confronting us. This involves the form and structure of the system of ownership of the means of production with socialist public ownership occupying an absolute dominant position, specific management and distribution systems which are compatible with various economic components, a planned economic system making use of market mechanisms, and others. In the past few years, the broad masses of people and cadres have created various specific forms of production relations which are suited to the multi-level conditions of the productive forces in urban and rural areas. Examples of this include the various forms of production responsibility systems which link remuneration with output and which are being popularized in the rural areas, the method of workers of state-run economic units taking charge of management being experimented within cities and others. Practice has shown that the adaptability of various specific forms to the multi-level condition of the productive forces varies and thus their effectiveness in promoting productivity also differs. These problems await our serious summing up and theoretical analysis.

Fourth, the solution of the above-mentioned problems must be based on economic and natural laws. Therefore, how to correctly understand and apply these laws is also an important research topic. Comrade Mao Zedong pointed out a long time ago that we still lack experience in economic construction and we need to accumulate experience. We must know that a contradiction exists in this problem--that is, the contradiction between the objective law of socialist economic development and our subjective understanding of the law. This must be resolved in the process of practice. With practice in the past few years, we have gradually come to know that we must not only master the general formulations of economic laws, but must also study the specific demands they place and the unique features and mechanisms of their operation under the concrete conditions in our country and in various stages of economic development. We must not only study economic laws one by one, but must also study their interrelation and interaction. At the same time, our understanding of economic and natural laws must not only be limited to the qualitative aspect. We must also know the quantitative rules that they ential under various conditions. Of course, to us, there are still many "realms of necessity" in the field of objective laws of socialist economic development. We must continue to sum up experiences from practice and gradually deepen our understanding of economic law in order to make future socialist modernization more harmonious with the requirements of objective laws.

Wu Baosan: It Is Extremely Necessary To Strengthen Study of the History of Economic Thinking

The "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" passed by the 6th plenary session is a brilliant document of historical materialism. One part of the document says that: "The study of Marxist theory, of present conditions and history of China and foreign countries and of various fields in the social and natural sciences must be greatly strengthened in the whole party." This is a very significant call. It greatly encourages and spurs on the social science workers. Under such a call and encouragement, what confronts us is how to do a good job in conducting economic science research work. As a research worker in the field of history of economic thought or history of economic ideology, I would like to talk about the present conditions of this field and present my suggestions on strengthening research work.

As an academic field, the history of economic thought or history of economic thinking belongs to the historical portion of political economics. It involves the entire history of the development of economic theories up to the present and its scope embraces both ancient and contemporary periods and Chinese and foreign countries. It has a very wide scope. At present, we only have a relatively systematic knowledge of foreign economic theories from the period after mercantilism up the the formulation of Marxist economic theory--that is, foreign economic theories from the early 16th century to the late 19th century or a span of more than 300 years. This is because Marx had conducted detailed analysis of various economic theories during this period and discarded the dross and extracted the essence in order to formulate his own economic theory. Today, we have great writings such as "A Critique of Political Economics," the "Theory of Surplus Value" and "Das Kapital" as our study guide. With regard to Western bourgeois economic theories after Marx's death, although our writings on the history of economic theories have sometimes mentioned them, we can say that our research in this aspect is still very insufficient. The study of contemporary Western political theories in new China started in the 1960's. At that time, there had been efforts to systematically introduce the major schools of thought and theories. However, this was interrupted by the "great cultural revolution." It was only after the smashing of the "gang of four" that research in this aspect was revived. As to the Chinese portion of the history of economic theories--the study of Chinese economic ideology, although a few writings on the subject have been published, they were actually only a beginning. It must be pointed out that none of the books published in our country on the history of economic theories or history of economic ideology included the history of the development of Chinese economic ideology. This was not due to the negligence of historians of economic theories, but was due to the fact that for a long period of time, writings on this subject in our country were very few and these provide historians of ideology with too little material. We must see that research in this field is closely related to bringing the spirit of patriotism into play. Our history is not lacking in rich and outstanding political ideas, but the contents of all the writings we read on the history of economic thinking came from foreign countries. Can we allow this situation to persist indefinitely? Furthermore, it is time that the study of the history of socialist political economy, including that of our country and that of other countries, be put on the agenda. Not to mention other countries, new China has been in existence for 32 years. During this period, the road taken by the study of socialist political economics has been quite tortuous. To study the history of the development of socialist political economics in our country and in foreign countries will be beneficial to developing socialist economic theory.

Every field of study has its reason for being. Generally speaking, the significance of the study of the history of economic theories lies in studying the past to understand the present. To cite an example, without knowing the shortcoming of the theory of labor value in classical political economics, we cannot fully understand the great significance of Marx's theories of labor value and surplus value. The value of the history of economic theories lies in its ability to provide material for the development of new economic theories. There are many examples in this aspect. The fact that classical political economics was one of the three sources of Marxism is the best example. Furthermore, the history of theories is not totally unrelated to present reality. Marx's economic theories play a guiding role in our socialist construction. This is obvious enough. Even in the case of bourgeois economics, although it deals with capitalist theories of economic management, although it is history, the issues it studies is related to contemporary actual problems. We must not treat it entirely as history. Thus, we must have an appropriate understanding of the importance of the study of the history of economic theories.

At present, there is an important question confronting us--that is, how to view modern and contemporary bourgeois economic theories. Modern and contemporary bourgeois economic theories basically serve to maintain the capitalist system. However, as I said above, they study actual economic problems in capitalist society, such as economic growth, economic projection, rational organization of various factors of production, changes in consumer demand and how to determine the prices of various commodities. It is worth considering whether we can learn something from their studies of these problems. At present, many economists hold the following view about bourgeois economic theories: No matter whether they be classical or contemporary, we must study them in depth and analytically and critically absorb from them things of value for our own use. We must not blindly worship and nor should we summarily negate everything. This is a rediscovery of bourgeois economic theories. That is also my view at present. The key point here is to study them. This is because to decide whether there is anything of value or of use in them and whether they must be categorically negated all depends on studying them in detail, using the Marxist standpoint, point of view and methods. Here, I would like to emphasize that we must learn from Marx. In order to study the law of economic movement in capitalist society, Marx read all the writings on bourgeois economics and wrote detailed discourses on the important writings. He affirmed the scientific elements and discarded the vulgar contents. Through Marx's study, today, we are able to comprehensively understand many important bourgeois economic writings before Marx and during his lifetime. It has been more than 100 years since Marx died. During Marx's old age, because he was finishing his masterpiece "Das Kapital," he was not able to study some important bourgeois economic writings published at that time, including "Theory of Political Economics" by English economist Jervons (1871), the "Principle of National Economy" by French-Swedish writer (Varla) [Wa Er La 3907 3643 2139] (1874). There are even more writings on bourgeois economics published from the time after Marx's death to the present. To mention some of the important ones, there are Italian Pareto's "Discourse on Political Economy," (1896-1897), English Malthus's "Principles of Economics" (1890), Swedish (Wickzel's) [Wei Ke Sai Er 1218 0344 1049 3643] "Discourse on Political Economy" (1901), English Keynes' "A General Discourse on Employment, Interest and Currency" (1936) and Italian-English (Slafa's) [Si La Fa 2448 2139 3127] "Producing Commodities With Commodities" (1960). Of course, there is a lot of dross in the above works. However, we have not seriously studied the above works and other works which were not mentioned. Is it necessary to study them? I think it is very necessary. Let us cite one example. The works of (Varla) and Pareto mentioned above were unknown in British and American economic circles at first. It was not until 1934, after (Schicks) [Xi Ke Si 1585 0344 2448] and (Allen) [Ai Lun 5337 0243] wrote a paper discussing (Varla) and Pareto's theory of general balance that British and American economic circles began to take their theories seriously. It took as long as 60 years before they were recognized. Later, Leontief made use of (Varla's) theory of general balance and mathematical methods to study the input and output relations among various sectors of the national economy. Arrow also used (Varla's) theory and mathematical methods to formulate his new theory on enterprise decisionmaking. This involves the question of the importance of analytical methods. In this aspect, we have many things to study in bourgeois economic theories. As a whole, we must emulate Marx and study and criticize important bourgeois economic works. This is absolutely necessary for us to absorb the useful things and criticize their faults. Furthermore, there are now many Western writings on the study of Marxist economics. We must also study them.

In the past 2 years, the economic circles in Beijing conducted symposia on foreign economic theories. This year, the People's Publishing House has begun publsihing a series of books on foreign economic theories to introduce the major schools of bourgeois economics at present. This is a good beginning in in-depth study of the history of economic thinking. I believe that under the call of the "resolution" to strengthen the study of social sciences, the study of the history of economic theories or the history of economic thinking will also reap rich results.

Wu Chengming: Comrade Mao Zedong's Incisive Analysis of the Chinese Bourgeoisie Enriched and Developed Marxism-Leninism

Comrade Mao Zedong was a great Marxist and a great proletarian revolutionary, strategist and theoretician. The Chinese communists, with Comrade Mao Zedong as their chief representative, made a theoretical summarization of the very rich practical experiencein the prolonged Chinese revolution according to the basic principles of Marxism-Leninism and formed the scientific guiding thoughts suitable for Chinese conditions. The product of this is Mao Zedong Thought, which is the application of the general principles of Marxism-Leninism to the actual practice of the Chinese revolution. Mao Zedong Thought enriched and developed Marxism-Leninism with a series of creative theories. Here, I would like to look at Comrade Mao Zedong's contributions to the treasury of Marxism-Leninism with his incisive analysis of the Chinese bourgeoisie.

The question of how a big agricultural country which was formerly semicolonial and semifeudal should treat the bourgeoisie in the course of democratic and socialist revolution, is an extremely important one. When in 1926, in his "Analysis of the Classes in Chinese Society," Comrade Mao Zedong pointed out: "Who are our enemies? Who are our friends? This is a question of the first importance for the revolution," he had already analyzed the Chinese bourgeoisie in detail and pointed out their trend of disintegration and their dual possibilities of becoming enemies or friends.

First, on the position and role of the bourgeoisie.

China was formerly an economically-backward country with a small peasant economy occupying an absolute predominant position. Capitalism was very weak. Then, how significant was the Chinese bourgeoisie? Some people, judging from this, negated the possibility of a socialist revolution in China or claimed that it could only be an "agricultural socialist revolution." Some people also doubted, after the liberation of the whole country, whether the contradiction between the working class and the bourgeoisie would become the principal contradiction in society.

The Chinese capitalist economy was indeed weak, but it had attained some development afterall. According to estimates, modern industrial output on the eve of liberation was 17 percent of overall industrial and agricultural output. To add the output of handicraft workshops with capitalistic characteristics, the sum made up 23 percent of overall industrial and agricultural production. The income of the modern communications and transportation industry also made up more than 50 percent of overall income from communications and transportation. The capitalist economy was under the control of basic industries like steelmaking and machine-building, major sources of energy like coal and electricity, major lines of transportation like railroads, highways and steamships, the entire national financial system, import and export trade and the markets in major cities. Thus, although the development of capitalist economy was limited, it controlled the lifeline of the national economy. It was precisely on this economic base that the big bourgeoisie collaborated with imperialism and the big landlord class, usurped state political power for a time and became one of the three major enemies of the Chinese people's revolution. It was also in accordance with this historical fact that Comrade Mao Zedong put forth the general line of new democracy and the three major economic programs.

Comrade Mao Zedong also took full account of the positive role of the bourgeoisie, particularly the national bourgeoisie. He pointed out that the national bourgeoisie led the Chinese democratic revolutionary movement at a relatively early period and highly regarded the great contributions and achievements of revolutionary forerunner, Mr Sun Yat-sen. He also pointed out that at that time, it was the social class with the highest cultural level, which had wide social connections and which exercised great political influence. In accordance with its dual character, he put forth the united front policy of unity and struggle. It was only through winning over the national bourgeoisie to join the revolution or to adopt a neutral attitude toward the revolution that the enemy could be isolated to the utmost extent. It was because of such a position and role of the bourgeoisie that the united front policy became one of the three magic weapons of the Chinese democratic revolution led by the proletariat.

After the liberation in 1949, industrial fixed assets in the whole country were worth merely 12.8 billion yuan and most of them consisted of bureaucrat capital confiscated by the people's government. At that time, private industrial capital amounted to merely 2 billion yuan. Thus, during our transition to socialism, could the contradiction between the working class and the bourgeoisie become the principal contradiction in society?

This mainly depended on the historical conditions at that time. During that period, although private capital was small, it still constituted 63.2 percent of industrial production (computed according to total production value) and 85 percent of urban and rural markets (computed according to retail volume). It employed 1.64 million industrial staff and workers and 6.62 million commercial employees, which was about 50 percent of the total number of workers. In order to change the backward condition of our economy, the state-run economy had to develop rapidly, while the capitalist economy which was beneficial to the national economy and the people's livelihood also had to be considerably developed. From 1949 to 1952, private industry was rapidly growing at the rate of 10,000 units each year and total production value increase was 54.2 percent. Under such conditions, its contradiction with the state-run economy and the staff and workers of the enterprises inevitably grew sharper. The bourgeoisie's speculation and profiteering and its attack on the state-run economy and the working class through illegal means became more and more rampant. This reached a peak before the "five antis" movement in 1952. These are irrefutable facts.

After the new democratic revolution won victory in the whole country and resolved the land problem, the principal contradiction in the country became that between the working class and the bourgeoisie. This point was put forth by Comrade Mao Zedong at the second plenary session of the Seventh Party Central Committee in 1949 and was again explicitly discussed by him in 1952. (See "Selected Works of Mao Zedong," Vol 5, p 65) This point and the party's general line during the period of transition which was formulated based on this point is a development of Marx's and particularly Lenin's theory on the period of transition. Lenin's theory on the period of transition started from the fact that "Russia is a very backward petit bourgeois country." However, he pointed out that like other countries, during the early period of transition to communism, Russia had three basic economic forms, that is "capitalism, small commodity production and communism" and correspondingly, there were three basic forces, that is, "bourgeoisie, petite bourgeoisie (particularly the peasants) and proletariat." This period of transition "inevitably had to be one in which the dying capitalism struggles against the growing communism." ("Selected Works of Lenin," Vol 4, pp 84, 85. "Communism" here means what we term as socialist society.) As to the means and methods to deal with this struggle, they differ from country to country. Our party's general line during the period of transition of simultaneously conducting socialist industrialization and socialist transformation was formulated according to the historical conditions in our country. It is well known that this has achieved great results.

Second, on the question of dividing the bourgeoisie into two categories.

A basic point in Comrade Mao Zedon'g revolutionary theory on new democracy was to divide the Chinese bourgeoisie into two categories: One was the big bourgeoisie or the bureaucrat-comprador bourgeoisie which was an appendage of imperialism; the other was the national bourgeoisie which had both the desire to revolt and the tendency to vascillate.

The differentiation of enemy from friend in our new democratic revolution was done according to this class analysis. The revolutionary united front led by the proletariat was also conducted according to this classification. The united front policy asked the national bourgeoisie to join the revolution or to at least maintain a sympathetic or neutral attitude toward the revolution in order to isolate the enemy to the greatest extent. This policy was able to attract a part of the big bourgeoisie into the united front under special conditions, particularly when national contradictions became the principal contradiction. The handling of the Xian incident in 1936 and the establishment of the anti-Japanese national united front was a clear example.

After the victory of the new democratic revolution, the socialist transformation of the system of private ownership of the means of production was also conducted according to the principle of classifying the bourgeoisie into two. Bureaucrat capital was completely confiscated while assets of the national bourgeoisie were peacefully bought out. This spirit also permeated the constitution, various political activities and the handling, education and transformation of bourgeois elements.

It must be clearly pointed out that the classification of the bourgeoisie into two was absolutely not a result of anyone's subjective will and was not artificially prescribed. This classification objectively exists and was historically formed.

Every economic phenomenon has to undergo a process. It has its continuity and its development is divided into stages. This was also true in the case of the development of capitalism in our country. The early enterprises of the Westernization movement were the offspring of officially-run industries of the feudal economy. They had comprador characteristics from the very beginning. Later, during the early 20th century, they developed into northern bureaucrat capital centering on fin ance. During the period of Chiang Kai-shek's rule, they gradually developed into their highest stage--comprador-bureaucrat-state monopoly capitalism. On the other hand, the early modern private enterprises originated from the seeds of capitalism in the feudal society. Going through their initial period of development and intermediate period of development, they reached their peak period in 1936 and started to go downhill after that. The distinction between the big bourgeoisie and the national bourgeoisie was because they were formed from different economic bases. The two continued to disintegrate, interpenetrate and transform themselves. However, on the whole, they continued to maintain different characteristics and carry their mutually contradictory aspect.

Classifying the bourgeoisie into two was also not simply a tactical move designed to take advantage of contradictions, win over the majority and attack the minority. It was the result of the communists' in-depth analysis of class contradiction in society according to the principle of the unity of opposites. Here, Comrade Mao Zedong's theory on the two kinds of contradictions showed great creative insight. According to this theory, we solved the problem of the big bourgeoisie by applying the principle of handling contradictions between the enemy and ourselves, solved the problem of the national bourgeoisie by applying the principle of handling contradictions among the people and achieved great results. Comrade Mao Zedong pointed out: Under the conditions in our country, the contradiction between the working class and the national bourgeoisie belonged to the category of contradiction among the people and the class struggle between the working class and the national bourgeoisie generally belonged to the category of class struggle among the people. Thus, he created a whole series of new methods of class struggle in politics, economics and ideological education and made contributions to the Marxist theory of class struggle. The article "On the Correct Handling of Contradictions Among the People" was published in 1957, but as Comrade Mao Zedong said, methods such as unity-criticism-unity mentioned in the article had been popularized outside the party in the liberated areas as early as the 1940's.

From this, we can also see that the theory of exercising allround dictatorship over the bourgeoisie which was put forth during the "great cultural revolution" and the whole set of stormy methods of class struggle were not only totally erroneous, but were also against the basic principles of Mao Zedong Thought.

Third, on the question of the elimination of classes.

Lenin said: Socialism is the elimination of classes. However, both Marx and Lenin did not concretely discuss the process of eliminating classes because they never encountered this situation. Comrade Mao Zedong took account of this process, although he did not discuss this in detail. However, this problem is clear in the context of Mao Zedong Thought.

The system of private ownership of the means of production is the economic base of the exploiting class. Comrade Mao Zedong led the works of land reform, confiscation of bureaucrat capital and the socialist transformation of capitalist industry and commerce. At the same time, he repeatedly stressed that while effecting this kind of change, elements of the reactionary classes must be given a way out, that jobs must be arranged for national bourgeois elements and that all members of the exploiting classes must be transformed into workers earning their own living. These policies and principles were undoubtedly correct.

Comrade Mao Zedong had always considered the remolding of the elements of the eliminated classes one of the important links in carrying on the revolutionary cause to the end. According to the Marxist dialectical principle governing the relations between existence and consciousness, Comrade Mao Zedong had always advocated that in order to advance the revolutionary cause, everyone must be and can be remolded. As early as 1937, he already put forth in his article "On Contradiction" the point that we must "remold the objective world and remold our subjective world." In 1949, on the eve of the complete victory of the democratic revolution, he put forth the task of remolding the overthrown old ruling class. He said: "When this work is well done, China's major exploiting classes, the landlord class and the bureaucrat bourgeoisie (the monopoly capitalist class), will be eliminated for good." ("On the People's Democratic Dictatorship")

The process of the socialist transformation of capitalist industry and commerce included the education and remolding of the members of the national bourgeoisie from the very beginning. Through the entire process of transforming capitalist enterprises, we did not ostracize the capitalists, but instead involved them in the process of change. As a matter of fact, much concrete work in the transformation process was done by the capitalists themselves. Thus, the process of transforming enterprises also remolded people. After joint public and private enterprises were established, special attention was paid to giving the capitalists jobs in order to enable them to work and study with the workers under the leadership of the party organizations in the enterprises. Thus, after terminating joint public and private enterprises and eliminating exploitation (stopping payment of fixed interest), an overwhelming majority of the bourgeoisie with the capacity to work had been remolded into workers in the socialist society, while an overwhelming majority of the remainder had become patriots who supported socialism.

Thus, in our country, the landlord and rich peasant classes were eliminated as social classes and the same was also true with the capitalists.

After the elimination of the exploiting classes, class struggle still continues in certain realms. The elimination of class differences and the uprooting of the social cause of class differences are long-term revolutionary tasks. However, this must not be confused with the original meaning of class contradiction and class struggle. After the transformation of the system of private ownership was basically accomplished, the Eighth Party Congress in 1956 correctly pointed out: Although we must continue to struggle for the completion of the socialist transformation and the final elimination of the exploitative system, the principal contradiction in our country now is no longer the contradiction between the working class and the bourgeoisie but the contradiction between the people's demand for rapid development of the economy and culture and the present economic and cultural situation's failure to satisfy the people's demand.

In 1957, Comrade Mao Zedong also suggested that the correct handling of contradictions among the people be considered the main theme in our country's political life. He further pointed out that the stormy mass class struggle during the period of revolution had basically ended and that from then on, the forms and methods of calss struggle would be different. These were important contributions to the Marxist theory of class struggle.

Tian Jiang Hai: Vigorously Search For Concrete Forms of Production Relations Which Are Suited to the Condition of the Productive Forces

The last part of the "resolution" pointed out: "A fixed set of models does not exist for the development of socialist production relations. Our task is to create at each stage concrete forms of production relations which are suited to each stage and which are conducive to its continuous growth in accordance with the requirement for the growth of the productive forces in our country." This is a conclusion arrived at by closely applying the basic Marxist principle that production relations must be compatible with the nature of the productive forces to our practical experience over the 32 years since the founding of the People's Republic. This is a significant long-term task being put forth to the broad masses of cadres and people and an important subject of study being put before the economic theorists.

The "resolution" pointed out: "A fixed set of models does not exist for the development of socialist production relations." This is worthy of profound consideration. In the past, there were too many "forbidden zones" in this field: if one proposed to change the system of state ownership characterized by "the nine unifieds ruling the country" ("nine unifieds" pertain to unified allocation and transfer of materials, unified procurement and marketing of commodities, unified financial income and expenditures, unified importation and exportation in foreign trade and unified planning), one was inevitably charged with negating the system of ownership by the whole people; if one proposed that state-run enterprises should assume responsibility for their own profits and losses, one was inevitably charged with engaging in capitalist methods of management; if one suggested the system of paying dues for fixed assets, one was inevitably accused of attempting to change the nature of state-run enterprises; if one suggested the method of having floating wages on top of basic wages, one was accused of changing the socialist system of distribution according to work. Even proposing piecework wages would be looked upon as practicing revisionism. As to fixing farm output quotas for each household, that was viewed as reviving capitalism. Thus, we rigidly restricted our options and were increasingly heading toward a cul-de-sac. Now, the "resolution" has given us a powerful ideological weapon and emancipated our minds. At the same time, it has also increased our responsibility as theoretical workers.

While the concrete forms of production relations are closely related to the nature of production relations they are not one and the same thing. Whether production relations are compatible with the condition of the productive forces is embodied in the concrete forms of production relations. On the other hand, changes in the concrete forms of production relations might also lead to some changes or even partial qualitative changes in the nature of production relations. The basic characteristics of production relations (system of public ownership and distribution according to work) can maintain stability for a considerable length of time, while the concrete forms of production relations are characterized by relative changeability. It is very insufficient for socialist political economics to limit itself to the study of the general law of the production relations adaptability to the nature of the productive forces. In-depth study must also be done on the concrete forms of the production relations and the actual condition of the productive forces.

The actual conditions of the productive forces in each stage of the entire historical period of socialism is different. At present, the level of productivity in our country is generally low and the level of mechanization and automation is also low. Furthermore, economic development is uneven. Industrial productivity is obviously higher than agricultural productivity; in the industrial sector, productivity in heavy industry is higher than in light industry, while development is also uneven within the heavy and light industrial sectors. There is also a big gap between the productivity level in various localities. The level of industrial development in coastal cities such as Shanghai and Tianjin is definitely much higher than inland areas, while the level of agricultural development in suburban areas of big cities and on the plains is noticeably higher than that in remote mountainous areas and minority nationality areas. Thus, the same concrete form of production relations might be compatible with the condition of the productive forces at one time and incompatible at another; it might be compatible with the condition of the productive forces in one area but not in another and it might be suited for the condition of the productive forces in one sector but not in another sector. This requires that when we determine the concrete form of production relations, we must start from the actual situation at a specific time and in a specific place and must not apply the formula of "uniformity." Leading organs must not make rigid and uniform demands, while the basic units must not mechanically copy other people's methods.

At the present stage of socialism in our country, we must take concrete forms of socialist production relations as a major concern in our search and creation of concrete forms of production relations which are compatible with the productive forces. However, we must also deal with their relations with concrete forms of the individual economy and take into account the latter forms. For example:

The concrete form of transition from the individual economy to the collective economy to the economy of the whole people. In the socialist transformation of agriculture, the handicraft industry and capitalist industry and commerce, our party led the masses to create many forms of transition from the private economy to the socialist economy of public ownership which were suited to the actual situation in our country. This was very successful and had great significance. For a considerable period of time from now on, we will have to preserve the individual economy. However, with the development of the productive forces and the change in the masses' demands and looking at the long-term trend, there ought to be a transition to the economy of public ownership. The concrete form of transition to be adopted must be studied. As to how the internal development of the economy of public ownership will be, we must devote even more efforts to its study. For example, we used to think that the order of development of the collective economy in the rural areas would be: from ownership by the production team to ownership by the production brigade to ownership by the commune then to state-run economy. Looking at it now, with the advent of joint agricultural-industrial-commercial enterprises, the delineation of administrative divisions and system of ownership has been bypassed. Thus, it has broken away from the rigid model that was conceptualized in the past.

The concrete form of the combination of the economy of the whole people, the collective economy and the individual economy. At present, various forms of joint economy, including joint enterprises under the system of ownership by the whole people and collective ownership, mergers of state-owned enterprises, mergers of collectively-owned enterprises and mergers of enterprises under the system of ownership by the whole people, collective ownership and individual ownership, have appeared in various areas. The emergence of these forms of joint economy has resulted in the interpenetration of the original economy of the whole people, collective economy and individual economy and brought about a state wherein "each one contains the others." The joining of hands of the economy of the whole people and the collective economy led to changes in the level of public ownership; the three-way merger of the economy of the whole people, the collective economy and the individual economy further caused the integration and transformation of public and private ownership; even the simple merger among enterprises under the system of ownership by the whole people and among enterprises under collective ownership has produced the differentiation between individual enterprises and joint enterprises. These organizational forms of joint economy appeared as an answer to the objective requirement for the development of the productive forces. They are capable of taking advantage of strong points and avoiding weak points and undertaking economic endeavors which individual enterprises or individual operations are incapable of doing. They have created new productive forces. These new concrete forms of production relations should arouse our great attention. Their role, prospects for their future development and other related questions should be subjects for further investigation and study.

The concrete forms of the right to own, occupy, control and make use of the means of production within the economy of the whole people and the collective economy, of the system of management and administration, of labor organization and of the system of distribution. This aspect is indeed controversial. The responsibility system of relating renumeration to output being enforced in the collective rural economy is an innovation. It established the link between the peasants' income and labor results, effectively implemented distribution according to work and mobilized the peasants' enthusiasm. On the contrary, the economy of the whole people such as industrial and mining enterprises has failed to solve these problems satisfactorily. Many enterprises are still practicing egalitarianism. They did not give inadequate bonuses, yet economic results were poor. It seems that some industrial and mining enterprises have no alternative but to adopt the economic responsibility system of basing remuneration on output practiced in the rural areas. However, industry is much more complicated than agriculture. The concrete measures are still to be studied thoroughly. I feel that at present, the key to creating concrete forms of economic relations which are compatible with the condition of the productive forces within the economy of the whole people in industries and mines lies in satisfactorily solving the problem of integration of power, responsibility and profit. We must study how to closely relate the overcoming of egalitarianism to the reform of the wage system and to strengthening the responsibility system through various concrete forms.

Socialist production relations are a completely new production relations in human history. They must be gradually perfected in the course of socialist practice. By searching for and creating concrete forms of production relations which are compatible with the development of the productive forces, we will enable socialist production relations to gradually improve and to better bring their strong points into play. As long as we faithfully observe the principle that production relations must be compatible with the nature of the productive forces, conduct in-depth investigation and study, do a good job in summing up experience and respect the people's will, we will surely be able to create concrete forms of socialist production relations which are compatible with the requirements for developing the productive forces and with the people's interests.

Liang Wensen, Pei Junsheng: Only By Persisting in the Party's Leadership Over the Cause of Socialist Construction Can We Continuously Advance

The past 32 years since the founding of the People's Republic is a history of the CCP's leadership of the people of all nationalities in the country in struggling for the socialist cause. The "Resolution on Certain Questions Concerning the History of Our Party Since the Founding of the PRC" passed by the 6th plenary session of the 11th CCP Central Committee ttok Marxism-Leninism-Mao Zedong Thought as guidance and realistically summed up the party's historical experience and lessons. It fully takes account of and affirms the achievements and successful experiences we had gained, while also taking note of past mistakes and setbacks, incisively analyzing the subjective and objective causes of mistakes and also further pointing out the correct road to socialist modernization which is compatible with our national situation. The "resolution" pointed out: "It is impermissible to ignore mistakes and cover up mistakes. This by itself is wrong and it will lead to even greater errors. However, our achievement in the past 32 years is still the main aspect. To ingore or negate our achievements and to ignore or negate the successful experiences in attaining these achievements is also a grave error." This analysis and judgment conforms with historical truth.

In the past 32 years, although we travelled a tortuous road, under the party's leadership, our socialist economic construction was still able to gain enormous achievements. This provides the development of the building of the four modernizations with a relatively solid foundation and a forward base. We must absolutely not belittle and underestimate this basic aspect.

After the liberation of the whole country, within a short period of 3 years, we healed the wounds left by long years of war, completed land reform in the new liberated areas, confiscated bureaucrat capitalist enterprises and converted them into socialist state-run enterprises, unified economic and financial work in the whole country, stabilized commodity prices and rapidly rehabilitated the national economy which suffered great destruction in old China.

On the basis of the rehabilitated national economy, the party adopted the timely general line for the transition period upon Comrade Mao Zedon'g suggestion. Under the guidance of this general line, we established and developed the socialist economy, started orderly economic construction with industrialization as the central theme, basically completed the socialist transformation of the system of private ownership of the means of production and eliminated the exploitative system. The exploiting class no longer exists as a social class. After some time, most of its members had been remolded into workers who earn their own living. The party effected the change from new democracy to socialism step by step. This is an extremely important change and achievement in our history. The establishment and consolidation of the socialist system is the foundation for any future progress and development.

After socialist transformation was basically completed, the system of public ownership of the means of production has come to occupy a position of absolute predominance in our country. Then, the party led the whole people to engage in overall socialist construction on a gigantic scale. After arduously laying the foundation, we have initially built an independent and relatively complete industrial system and national economic system. The basic industries, particularly the materials industry saw great development; industrial sectors have become relatively complete and many new industrial sectors were established; the machine building industry provided a great amount of technological equipment to agriculture, industry, communications and transportation and other sectors of the national economy; (according to rough estimates, 80 percent of equipment used in basic industries were domestically manufactured); production of the consumer goods industry also developed correspondingly. (Particularly in the past 2 years, the light and textile industries have experienced rapid development and their growth rate has surpassed that of heavy industry.) The establishment of an independent and relatively complete industrial structure enables us to independently build socialist modernization and to possess a greater capability to digest and absorb foreign investment and technology, in order to better implement the policy of self-reliance in the main and foreign aid as a supplement.

Over the 100 years or so from the Westernization movement during the late Qing Dynasty to 1949, our country merely accumulated a total of 12.8 billion yuan in industrial fixed assets. On the other hand, over the 32 years after the founding of the People's Republic, our industrial fixed assets increased by 400 billion yuan if computed by original value or by nearly 300 billion yuan if computed by net worth. This is 20 or 30 times that in the 100 years or so before liberation. Since the founding of the People's Republic, we have built hundreds of thousands of industrial and communications enterprises. This creates favorable conditions for our future efforts to realize the shift from extensive to intensive means in expanded reproduction and the shift from extensive to intensive operations in agriculture. In the foreseeable future, except for some urgently needed items in energy and transportation, basically, we will not build new enterprises but will rely on existing enterprises. In industry, we will mainly rely on more than 40 million staff and workers and the existing 370,000 enterprises to engage in intensive operations. As long as they tap their potentials and engage in necessary technological restructuring, they will be able to create more material wealth. For our technological force in achieving modernization, we will also mainly rely on the millions of technological personnel who graduated during the 1960's and 1970's and who have undergone tempering and the great number of skilled workers who were trained after liberation to create a technological level of the 1970's and 1980's.

With the support of industry and other sectors, significant changes have occurred in the conditions of agricultural production and productivity has tremendously increased. Comparing 1980 with 1952, grain output has increased by 100 percent and cotton output also by 100 percent. With merely 7 percent of total arable land in the world, we have basically solved the problems of food and clothing of nearly one-fourth of the world population and changed the situation of hunger and cold in old China.

On the basis of the development of production, urban and rural commerce and foreign trade also grew significantly. There has also been great progress in education, science, culture, health and sports. The people's livelihood has significantly improved compared with before liberation. In 1980, per capita consumption in urban and rural areas (deducting the price factor) rose by nearly 100 percent over that in 1952. Furthermore, the composition of the people's consumption pattern has also begun to change. The proportion of consumption for food has dropped, while that for clothing and daily items has increased. The health level of both urban and rural people has also improved tremendously and average life expectancy has become much higher. From the former "sickman of Asia" our country has leaped to the present position of "giant of the East." This is a great change which was by no means easy to attain.

Of course, we do not deny that our achievement is still unsatisfactory compared to the great amount of labor expended and natural resources consumed. This was mainly caused by the leftist errors in our economic work. We were too impatient to get results, such as during the time of the "great leap forward" in the 1950's. In particular, an all-encompassing and long-term grave error such as the "great cultural revolution" made us unable to achieve even greater results which we should have been able to.

However, our party has the courage to face its own shortcomings and errors. It is able to take Marxism-Leninism-Mao Zedong Thought as guidance and rely on the unity of the whole party to overcome its own shortcomings and rectify its own errors. Hardly any other political party can do that. Particularly after the 3d plenary session of the 11th CCP Central Committee, through a series of arduous work, the task of bringing order out of chaos in the party's guiding ideology was completed. Today, our party is stronger and more powerful. We can absolutely trust that the CCP, which has been tested by complicated struggles over a long period of time, and has the courage and ability to lead the whole people, and surmount every difficulty to win new victories. Historical truth tells us that without the CCP, we cannot realize a modern socialist China. It is only by persisting in the party's leadership that the cause of building socialism can victoriously advance and continuously progress.

CSO: 4006/34

SHANGHAI PAPER ON DEVELOPMENT AMID READJUSTMENT

HK120937 Shanghai SHIJIE JINGJI DAOBAO in Chinese No 49, 7 Sep 81 p 3

[Speech by Meng Zhaowen [1322 2507 2429], Head of Management Science Study Group of Chinese Academy of Science Given at Beijing Forum on Economic and Social Development Strategy: "Tentative Discussion on the Possibility of High-Speed Economic Development in China During the Readjustment Period"]

[Text] Now the party Central Committee has formulated the eight-character policy of "readjusting reforming, consolidating and improving" to be implemented nationwide to the whole national economy, and it has also pointed out that economic construction must conform to our national condition. This is very correct and fits in with the actual circumstances. The very purpose of readjustment is to make still better progress and to have more rapid development.

Since the third plenary session, with constant criticism on the "leftist" errors in the guiding thinking in relation to capital construction, we have adopted some important policies and measures. As a result, agriculture and light industry have undergone comparatively significant development. The internal structure of industrial production is also undergoing reform and has achieved rather important results. Meanwhile, we have acquired a very deep understanding of our country's national condition as well as its objective economic laws, and dome of the acute contradictions that have been existing in our economy are gradually being revealed. In the process of readjustment and rectification, as quite a number of enterprises are retreating naturally government revenues are being affected and an inertia has appeared in the turnover of funds. Then, is it true that in the process of readjustment we can only take a passive position and keep waiting? Can we not take a more active position? Actually, there are other patterns practicable for the economic development of our country. We can give full play to our economic potential, satisfy the needs of our people, and enable the development of our national economy to proceed at a suitably high speed.

Now the discrepancy between the investment scale of our country and the corresponding supply capacity of such an investment (the net output value of the departments producing the means of production) is comparatively large. The supply capacity is greatly in excess of investment. However, as a result of the lack of investment, a considerable part of our production capacity is being kept idle without playing its role.

In recent years, much has been mentioned in the press about the fact that the growth rate of the means of subsistence has surpassed that of the means of production, and even the fact that the value of output of the means of subsistence has surpassed that of the means of production, and such performances are cited as achievements of readjustment. Actually, it does not follow that the bigger the proportion of the production of consumer goods, the more rational the economic structure. Rather, what we want is an appropriate proportion between the two.

The energy and supply departments take a good proportion, yet they cannot meet the demand. This is mainly due to a poor rate of utilization and the inappropriateness of variety and specification. The proportion of the manufacturing industry is not too large, but a bit too small, and therefore should be increased. In the economic readjustment, the manufacturing industry has been regarded as baggage and is finding it difficult to play its role. This is due to the fact that in the past many general assembly plants and all-purpose plants were inappropriately set up, causing duplication of production capacity and leaving really needs production facilities unorganized as well as many gaps and products in short supply.

Now, the demand in the countryside for industrial consumer products and construction materials is increasing by a big margin. It is estimated that by 1990 the domestic purchasing power will increase to 370 to 400 billion yuan.

In order to ensure equilibrium between social production and consumption as well as all-round development, up to 1990, the scale of investment of several major sectors will be as follows:

1. In order to change the situation of high consumption and low efficiency that has been in existence for a long time in industrial production, it is necessary to undertake the necessary technological improvement in the metallurgy, chemical engineering, machine building, construction material and electric power industries as well as the consumers' sector. Approximately 250 billion yuan will be needed for investment in this aspect.

2. In order to satisfy the current urgent needs and to provide a good foundation for the years after 1990, an investment of approximately 200 billion yuan will be needed for the energy sector and its corresponding sea ports.

3. An investment of approximately 100 billion yuan is needed for developing agricultural production, protecting and improving the econological environment, and for the setting up of necessary food and agricultural product processing industries in the various counties.

4. With regard to investments in facilities for social consumption and welfare, such investments comprised 28 percent of total investments in the first 5-year plan. Later on, it was reduced to 10 percent. The reduction of expenses in this field can only postpone consumption, leaving the contradictions unsolved in actuality. About 100 billion yuan will be needed to make up for what has been postponed. Added to this is the expansion of construction for the coming 10 years. Altogether 200 billion will be needed.

5. About 100 billion yuan of investment will be needed in the field of science and national defense.

The grand total of the above amounts to 850 billion yuan, a rough estimate and an approximate scale for illustrative purposes. As the production capacity of the manufacturing industry will be still expanding year by year, there will not be much of a problem in satisfying the needs of such a scale in terms of the total supply capacity.

In the past, comparatively speaking, we paid more attention to capital construction. Now, we have already a rather large base. If we put the emphasis in development on the improvement of technology, not only time is saved but also effort and money.

Now, in the production sector there are the following shortcomings: high consumption, low efficiency, backwardness in technology and products, and lack of competitiveness on the international market. In the past, due to the lack of funds, generally speaking technological improvement was only undertaken in a fragmentary way and no systematic and overall planning was made. Consequently, the results were not very evident. We must make up our mind and be resolute and thoroughly improve this. The key lies in specifying a definite target and procedures as well as formulating a good plan.

The target for technological improvement is to double the value of industrial output in the 10 years roughly on the basis of the present raw material and energy (with small increments).

In the case of the advanced countries, with the same amount of consumption their value of output exceeds ours by 100 to 400 percent. Our tentative plan is to double the value of output. Despite the difficulty of accomplishing this, it is by no means impossible.

According to this tentative plan, the investment in technological restructuring and renewal of equipment will be 20 to 60 percent less than that in capital construction, and a time saving of one-third to one-half will be achieved. Taking the present total value of fixed assets as the base for estimation, the total investment would be 250 billion yuan. With such a preliminary target and controlling figure, it is possible to consider a general project for technological restructuring.

As to the procedures for technological restructuring, we will start from reduction of energy consumption.

In the period from 1955 to 1975, energy consumption was about the same in Japan and our country, but the value of output in Japan was 400 percent greater than ours. The present level of our industrial technological equipment is about the same as that of Japan in 1955, perhaps a little better. If we begin undertaking this matter right now, we can also achieve the end of modernizing our equipment as well as producing more output for the satisfaction of the people's needs.

Of course, many factors being incomparable between Japan and our country in the matter of energy consumption, it is difficult to raise the rate of efficiency of energy consumption to that of Japan in a short span of time. However, if technological restructuring is made in the field of metallurgy, chemical engineering, industrial ovens, electric power, communications industries and the civil consumption sector as well as the composition of products, it should be said that an increase of roughly 10 percent in the general rate of efficiency of energy consumption is technically possible.

The performance index of the industrial products of our country is comparatively low. Of the 26,000 mechanical products, the design of 60 percent is prior to the 1950's. The energy consumption of boilers, electrical equipment, air blowers and so on is 10 to 20 percent higher than that of the advanced index. In this respect, planned replacements, renewal as well as the development of new products will be needed. Only by ensuring good performance in this fundamental work will it be possible for us to shift our national economy to the track of modernization.

Such a transformation process is only possible on the basis of a developing national economy. It is only with constant factory orders that product designs and technological restructuring can be earnestly undertaken. If the funds of factory orders are blocked, the enterprises will be out of funds for undertaking transformation, and the whole cycle will be interrupted, and everything will become empty talk. Now quite a number of major state-owned factories are operating below capacity and they are looking for assignments by themselves. This upsets the division of production and the system of cooperation, and causes waste in manpower and supplies. This is not the normal state of the national economic readjustment, and is harmful to the future development of production. If we are real believers of Marx's doctrine of labor creation of value, by formulating a good readjustment plan and utilizing the present funds of the enterprises, it is perfectly feasible to motivate the cycle of technological restructuring and the situation will become very favorable.

Of the thermal power plants in our country, about 20 million kilowatts are generated by medium-temperature and pressure, small-sized generators. Their consumption is high and output low. If they are all converted into high-temperature and pressure generators, about 20 million tons of coal can be saved annually. This is also equivalent to the addition of 5 million kilowatts of new generators, which can boost electricity generation by about 30 billion kilowatt-hours. This is equivalent to 10 percent of the electricity generation of our country. If this newly added electric energy is applied to production, about 10 billion yuan of material wealth could be created annually.

Then, is such a transformation possible? In terms of a general installed capacity of 25 million kilowatts, an investment of 15 billion yuan is needed. The needed supplies (including those indirectly needed) are mainly as follows: 10 billion kilowatt-hours of electricity, 1.1 million tons of crude oil, 250,000 tons of steel products, and 19,000 tons of cooper. In terms of the production capacity of the first ministry of machine building and certain other departments concerned, the whole transformation would take about 8 years.

In the process of the transformation of power plants, consideration can also be given to integrated utilization of resources. For example, the utilization of powered coal ashes from the power plants for making cement is a well developed technology. The use of waste ashes in making cement not only increases value of output, but also alleviates contamination of the environment.

The other industries can also identify the key sectors in which technological restructuring should be undertaken first. When part of the energy and supplies are saved according to plan throughout the country, technological restructuring can be extended to a wider scope until it covers the whole country.

The lack of funds is a manifestation of the inadequacy of surplus labor supplied by the society, but this does not imply that such a supply is not feasible. A combined study should be made of the possibility of the supply of funds and its allocation.

There are various ways to find sources of funds, such as expanding the production of consumer goods, the development of tertiary industry, the floating of foreign debts, the importation of foreign capital, and so on. The most important ones, however, are the enhancement of labor productivity and the expansion of planned investment.

In the past, we blindly produced many products which had no use value and were of little economic effect. Moreover, we left out many things which we should have done in our plans. This brought the consequence of the divorcement of funds from physical products, causing the funds to remain idle without making any turnover on the one hand, and leaving no funds for investment for the products which were needed and could have been produced.

If we have a well defined production aim and produce what we need, making the compensation of materials and value completely complementary, then once the needed products are produced, invariably there can be found the corresponding funds in the general capital. Therefore, the problem of funds could cause no problem.

We have been talking about the lack of funds, and yet plants, equipment, manpower, technology, and the reserve of materials are themselves funds. However, without the "prime mover," that is, the planning of investment, nothing can be motivated and no new value can be produced.

Take a 100,000 kilowatt turbogenerator as an example. The generator costs 6.7 million yuan, of which raw materials comprise 49 percent, wages and management expenses comprise 14 percent, and profit and taxes comprise 37 percent. The percentage make-up of the various industries may vary, but roughly speaking all comprise the same constituents.

If the electricity department had not purchased the generator from the turbogenerator factory, the factory would have paid the wages and management expenses just the same and the circulating funds would have been tied up all the same. Thus, the factory not only would turnover no profit and pay no taxes to the state, but would have consumed the profits of other factories. If purchase orders were made, such factories would operate normally. While they turn over profits to the state, the factories and mines that supply the materials also increase their production and turn over part of their profits to the state.

Here, we should notice that the physical form of profit we refer to here is the turbogenerator, which can be used only in the construction of the electric power industry, and nothing else. Hence, we can raise a question in the reverse way. Do we need the generator? If we do, we should organize such production and make it hand over its profit to the state and take its corresponding share of the general capital of the state. To put it in another way, produce what is needed and make physical and value compensation fully complementary.

The factories that manufacture equipment for power stations in our country are operating at partial capacity. If the electricity departments place their orders with the machine building factories, this would necessarily cause a string of other factories to place their orders in turn. The management expenses, wages and other expenses of these factories would in the final analysis also become certain physical material consumption, dependent on other factories for the production of these materials and exchanges are made among these factories. Again, these factories also have their profits to turn over to the state. This is similar to the calculation of the total consumption of the products, in which case the total profits of the factories concerned are equal to the total investment made by the electricity departments, and no financial loss could possibly be involved.

The above analysis shows that the scale of economic activities of our country are 10 to 30 billion yuan less than their normal level. This is the main factor for which government deficit can provide no solution. Adding a number of tens of billions of yuan of investment will not cause government financial deficits. What we should pay attention to is their correct usage and improvement of management methods.

In short, developing production is the fundamental way for getting rid of the latent dangers of our national economy. The same can be applied to our economic tasks. Adopting urgent measures temporarily is quite necessary, but by and large the problem can only be solved in the process of movement and circulation. The series of difficult problems of government deficits, employment, social consumption, and so on, can only find their solution in the process of development. Only in the process of development can we expect to have our economy rationally readjusted step by step. It is development which makes possible the combination of socialist material and spiritual civilization, enlivens our national spirit of working hard to strive for a strong country and enable ourselves to stand on our own feet in the family of nations.

ECONOMIC PLANNING

DEFINITE GROWTH RATE DEEMED NECESSARY DURING ECONOMIC READJUSTMENT

Beijing GUANGMING RIBAO in Chinese 12 Sep 81 p 3

[Article by Gu Ming [7357 2492] and Tang Shaoming [0781 4801 2494]: "A Certain Growth Rate Must Be Maintained During the National Economic Readjustment"]

[Text] Great achievements have been made in the policy of further readjusting the national economy since the work conference of the Central Committee in December last year. The leftist guiding ideology has been further corrected in economic work; the capital construction projects which were beyond the national capability have been reduced; the overemphasis of heavy industry and the self-serving cycle have been changed; and light industry has been developed. Most gratifying of all is the situation in the countryside where various forms of responsibility system are now in popular use. Despite serious disasters this year, a good national harvest can still be expected. The market is brisk in both urban and rural areas. In the first half of this year, the volume of retail sales exceeded that of the same period last year by 9 percent; people's savings deposits have increased by a fairly wide margin; and the withdrawal of currency is proceeding smoothly. This fine situation has not come easy and should be carefully cherished and energetically developed.

However, we must also note that the readjustment of a national economy, which is seriously out of proportion, cannot be easy. We are now confronted with many prpblems and diifficulties. As things now stand, there are more problems and difficulties in industry as clearly shown by the very slow industrial growth in the first half of this year. Compared with the same period last year, it has increased by only 0.9 percent. This situation should deserve our great attention.

It is quite natural that industrial production may decline during a major readjustment of the national economy. Some capital construction projects have to be halted; some plants have to be closed or half-closed, and others have to be amalgamated or converted to produce other lines of products. Production of these plants has naturally declined. The majority of the plants to be closed, suspended, amalgamated and converted are engaged in heavy industry, and their output value is generally fairly high. In the first half of this year, light industry developed very rapidly; and its output value increased by 11.6 percent. The output value of certain branches of the heavy industry has also increased, but this increase cannot make up for the decline of heavy industrial production as a whole. This is the main cause of the reduced growth rate of the national economy.

We should also note the other factors that may affect the national economic growth rate. The idleness, laxity and inertia in the leading bodies of some enterprises are out of place in the new situation. Some people have even disregarded the state's interests and ganged up with unscrupulous elements in working against the state by violating laws and disciplines. In industrial management, some policies and measures have been formulated without taking into consideration the difference between good and bad management, and thus cannot insure greater economic benefits for well managed enterprises. The result is "eating out of the same pot provided by the state." In distribution within the enterprises, the principle of "more pay for more work, less pay for less work, and no pay for no work" cannot be effectively implemented. The result is, again, "eating out of the same pot provided by the enterprise." Equalitarianism in these two forms has seriously affected the morale of the enterprises and their workers and staff members.

Because of these objective and subjective factors, the rate of industrial growth in the first half of the year has markedly declined.

In the opinion of some comrades, there is no need to worry about the growth rate, because as soon as the proportionate relationship of the national economy is well adjusted, the growth rate will automatically increase. It is true that readjustment is the central task of the moment, and it is beyond doubt that sufficient retreat must be made, if a retreat is necessary at all. Furthermore, there should be a proportionate relationship before a high growth rate is possible. However, we must also be aware that the readjustment is a somewhat long-term task. If there cannot be a certain national economic growth rate throughout the period of readjustment, it will be harmful to national economic development. In addition to developments in future, it may also affect the readjustment going on at present. The question of a national economic growth rate is in essence the question of whether it is possible at all to raise the capacity for expanded reproduction and the people's standard of living, and, if possible, whether the raise will be quick or slow. The growth rate is in direct proportion to this raise, because the quicker the national economic development, the greater will be the increase of social products and the newly created value. The scope of expanded reproduction and the extent of the improvement of people's livelihood are determined by the growth rate of social production and the newly added value. Without the assurance of a certain growth rate, we will not be able to carry out expanded reproduction or to improve the people's livelihood; sometimes, even simple reproduction and the maintenance of the people's present standard of living may be impossible. If such a situation should continue, there will be an economic recession with serious consequences. Therefore, while attending to readjustment as our main concern we must never overlook the question of growth rate, and every effort must be made to maintain a certain growth rate.

Other comrades pointed out that there was also a readjustment in the early 1960's, when the national economic growth rate was very low or even below zero. Since the question of a economic recession did not arise then, they wonder why should there be so much stress on the growth rate now? This question can be easily answered if we will compare the two readjustments. They certainly have many similarities, and we should carefully learn from, and make use of, the experiences of the first readjustment. However, we should pay even greater attention to the study of their differences, otherwise, we cannot solve the present problems. The first difference is that the task involved this time is much heavier and more time-consuming than the previous one, because different sectors of the national economy are now more seriously out of proportion. During the first readjustment, the projects to be halted and the enterprises to be closed, suspended amalgamated and converted were mostly small and indigenous ones, whereas the present readjustment involves many modern projects and enterprises. The situation is now much more complicated. The second difference is that during the first readjustment, some 20 million workers were organized to go to the countryside, and their relocation greatly reduced the burden of the state and the cities. This time, however, instead of any reduction of workers, there is the problem of providng jobs to the young people. If we fail to maintain a certain growth rate now, economic stability can hardly be guaranteed, and even social stability may be jeopardized.

Still other comrades held that since great efforts have been made in overcoming the leftist tendency to strive for high targets blindly, stress on a growth rate now would mean a recurrence of the old malady. It is true that striving for high targets and high speed blindly regardless of a disproportionate national economy and our actual capability has long been the cause of our unhealthy economic guiding ideology, and it is entirely correct for it to be repudiated and overcome. However, this does not mean that we do not want speed--a fairly high speed based on our actual capability. We are at all times convinced that with the elimination of exploitation under the socialist system, we should, and can, have a higher rate of national economic growth than that of capitalism, and we did have high national economic growth rates in the 1950's and 1960's. There is a basic difference between the high growth rate achieved under correct ideological guidance and based on the superiority of the socialist system on the one hand and the kind of growth rate obtained under leftist ideological guidance and through rash acts which are detrimental to the proportionate relationship of the national economy on the other. We should not call it a recurrence of leftist ideological malady at the very mention of growth rate. Of course, we should not, and cannot, demand a high growth rate during the present readjustment; however, we cannot be without a certain growth rate either. As long as we have an accurate understanding of this problem and adopt the necessary measures, we should be capable of maintaining a certain growth rate.

To increase the national economic growth rate in light of the present situation, it is very important that we should carefully wind up the work of halting projects and closing, suspending, amalgamating and converting the enterprises, so that their productive capacity can still be utilized instead of being left idle. Unused productive capacity, either in the form of machinery or labor power, means consumption instead of production of wealth, and this is a great waste for the society. Therefore, we must quickly help these units convert to the production of readily saleable goods and minimize the period of suspended business operation. In this connection we are experiencing serious difficulties in dealing with the metallurgical and machinery industries. They are now endeavoring to adapt themselves to the new situation by readjusting their orientation of service. Instead of going around in circles aimlessly, their production process is now geared to serving agriculture, a light industry and people's daily life, with gratifying results. For example, even such a large metalurgical enterprise as the Anshan Iron and Steel Company has changed its orientation of serving only the heavy industry and newly set up three production lines specially for the production of high frequency electric welding tubes and galvanized sheets urgently required by the light and textile industries. Besides meeting these requirements, the company has also developed its production and increased its profits. To cite another example, the machinery manufacturing departments under the First Bureau of Machine Building in Tianjin has readjusted its orientation of service since 1980, and supplied hundreds of special machinery items and thousands of sets of auxiliary equipment in addition to designing and setting up a number of production lines and offering various technical services for the light and textile industries. Furthermore, it has produced hundreds of thousands of durable consumer goods for the market. Needless to say, heavy industry departments have the responsibility of carrying out renovating and outfitting jobs for the national economy with up-to-date technology. In this connection, we should take a long-range view of the situation and work out our plans accordingly. For example, large power generating and coal extraction equipment will still be required in the next several years, and the production of such equipment take a long time. Therefore, this production should be planned now. Furthermore, we have in our country a large number of boilers with high energy consumption and low efficiency. If we have the determination to carry out technical renovation, we should plan for these boilers to be renovated within a certain time, so that their energy consumption will be lowered and their efficiency raised.

To raise the growth rate of the national economy, we must now carefully attend to the work of enterprise consolidation and the establishment of an economic responsibility ststem. These are the most practical methods of tapping the potentials of enterprises, improving the economic results, and accelerating economic development. The key to enterprise consolidation is to streamline the leading bodies and at the same time strengthen ideological and basic work among the enterprises; and to raise economic management efficiency, provide more active supervision, and overcome departmentalism. Enterprise consolidation should go hand in hand with the establishment of the economic responsibility system. Only a system of economic responsibility can effectively overcome equalitarianism--which is now qutie serious--and arouse the enthusiasm of the enterprises and their workers and staff members. Some localities have adopted the system of responsibility for profits, and some enterprises under favorable conditions have adopted the piecework wage system or above-quota piecework system, all with remarkable success.

There is still great potential to be tapped in raising the growth rate of our national economy. The fixed assets of our state-run enterprises are by no means little, but the economic results have been very poor. In 1978, for example, the ratio of fixed assets of state-run enterprises throughout the country to their total output value was approximately 1:3. If we can only raise the ratio of output value by 1 point, it will mean an icrease of tens of billions of yuan. Therefore, as long as we can make all out efforts to continue the work, which has proved to be effective, we can certainly overcome the difficulties, tap the potential, and maintian a certain growth rate during the readjustment period.

BRIEFS

GUANGZHOU ECONOMIC RESPONSIBILITY SYSTEM--With the approval of the Guangzhou Municipal Revolutionary Committee, six Guangzhou industrial bureaus, namely the Light Industrial Bureau, the Number 2 Light Industrial Bureau, Electronics Industrial Bureau, Petrochemical Industrial Bureau, Rubber Manufacturing Bureau and the Machine Building Bureau implemented an economic responsibility system of signing contracts for profits in the entire trade, beginning this year. In implementing this economic responsibility system, the six trades upheld the principle of submitting basic production quotas to the state and dividing and retaining a certain portion of profits for a period of 3 years. For profits obtained as a result of overproduction, the light industrial, the number 2 light industrial, rubber manufacturing and machine building bureaus are allowed to retain 35 percent of the profits, submitting the remaining 65 percent to the Municipal Financial Bureau; while the Electronics and Petrochemical Industrial Bureaus are to equally share their profits with the Municipal Financial Bureau. The industries must ensure the fulfillment of production quotas and are responsible for losses, if any. The profits retained are to be used for technical revolution and welfare of the workers. BANKS URGED TO SUPPORT ECONOMIC DIVERSIFICATION IN COUNTRYSIDE

Jinan DAZHONG RIBAO in Chinese 28 Aug 81 p 2

[Commentator's article: "There Are Good Opportunities for Financial Institutions To Support Economic Diversification in the Countryside"]

[Text] In the past 2 years, rural financial institutions in our province have continually readjusted the structure of their agricultural loans. Heavy support for farmland capital construction by communes and production brigades and concentrating solely on grain production, has gradually shifted to a program of continued sufficient support for grain production, and heavy support for economic diversification. The proportion of all agricultural loans used to support economic diversification has been gradually increasing, and this is playing a remarkable role in enlivening the rural economy and increasing the peasants' income.

Success in supporting economic diversification is attributed to the efforts of the units in implementing the spirit of the Third Plenary Session of the 11th Party Central Committee, eliminating "leftist" influences, emancipating their mind and adopting flexible policies. Some units are not so successful mainly because they are lagging behind in these respects. Hereafter, if we want to insure the availability of capital for the rapid development of economic diversification in our province, we must eliminate "leftist" influences and have a better understanding of the importance of developing a diversified economy.

Some comrades in the rural financial institutions have a certain psychological "fear" of supporting economic diversification--the fear that the loans granted may not bring about good economic results and consequently cannot be redeemed. Therefore, they are beset with worry at the thought of extending loans to support household sideline occupation. We agree that stress on economic results and worry over the redemption of loans are justified, because, if the economic results are poor--meaning business losses--and the loans cannot be redeemed, not only the state, but also the collectives and the commune members have to suffer losses. However, in stressing economic results, we should also pay attention to our work. These comrades should cooperate with the relevant departments in conducting serious investigations and study and keep themselves well informed of the conditions of resources. After careful comparisons, they should help the chosen collectives and commune members bring out their local strong points and adapt measures to local conditions in developing their production. At the same time, they should avail themselves of the strong points of banks, such as their wide range of contacts and their abundant sources of information, and take the initiative to arrange contacts for the communes and production brigades or to clear the channels between production and marketing. As long as these jobs are accomplished, there will generally be good economic results. Many banking centers and credit cooperatives have gained good experiences in so doing. Some comrades have said: "There are many strong points available; the main question is whether or not people will look for them." These words make a lot of sense.

In the countryside, many commune members are very adept in sideline occupations and stand out because of their increased income. As long as their business is legitimate under party policies, their income is right and proper. We must not be afraid of giving these peasants continued support simply because they have already made more money than others have. All commune members, rich or poor, should be actively supported in their household sideline occupations. Of course, misuse of loans or even speculation and profiteering must be checked, and the banks or credit cooperatives can, in coordination with the relevant departments, use credit as a means to combat illicit activities carried out in the guise of sideline occupations.

Another tendency is that some comrades are keeping their eyes on only the large projects which may yield immediate benefits and ignore the small ones which may not yield profits so quickly. These comrades are concerned with only single transactions but not comprehensive ones, and with only the immediate but not the distant future. As a result, support for economic diversification economy fails to make much headway. We believe that as long as they can make a right choice, it is quite proper for them to support some communes, production brigades or teams, and even individual commune members in undertaking large projects suitable for the local conditions; but small projects cannot be ignored. Both large and small projects should be encouraged, because some small projects, such as the raising of rabbits, tuyuan /0960 0337/ and sables can be very profitable. We have to increase the sources of revenue and make greater efforts in this direction. The projects may be small, the varieties of products may be complex, and the profits may be little; however, we will have more to gain from increased sources of revenue. There should be coordination between long- and short-range plans. We should give priority to the support of such projects as industrial sideline production which yield quick benefits, but we should not neglect those steady and reliable projects requiring long periods to yield products of long lasting value, such as the planting of trees, including fruit-bearing trees. In developing long- or short-range projects, we should help the communes and production brigades work out their plans in such a way that long-range projects will stimulate the short-range ones, while the short-range ones will help maintain the growth of the long-range ones.

Our province has abundant natural resources, and there are great potentials for developing diversified economy. There are also widespread banking facilities, and a close relationship between credit and production in the vast countryside, with good opportunities for the financial institutions to support the development of economic diversification.

BRIEFS

JILIN SAVING DEPOSITS--After the big increase in 1980, bank saving deposits of Jilin Province have increased in the first 9 months of 1981. The amount has risen to 1.3 billion yuan, an increase of 235 million yuan over the figure at the end of 1980. [Changchun Jilin Provincial Service in Mandarin 2200 GMT 29 Sep 81 SK]

SHANDONG URBAN DEPOSITS--From 1979 to mid-September 1981, Shandong Urban Deposits registered a 730 million yuan increase, surpassing the increased sum of the 1949-1978 period. In the January-August period of 1981, provincial urban deposits registered a 240 million yuan increase. The urban deposit sum has reached 1.4 billion yuan. These urban banks have prefulfilled their annual deposit plan by 100 days. According to statistics compiled at the end of September, the per capita deposits of staff and workers throughout the province reaches 275 yuan, surpassing the 1978 deposit by nearly 100 percent. Provincial urban deposits have accounted for a fourth of the funds obtained by the Provincial People's Bank. [SK301000 Jinan Shandong Provincial Service in Mandarin 2300 GMT 29 Sep 81]

ALTERING MAKE-UP OF ENERGY RESOURCES TO CONTROL POLLUTION

Beijing HUANJING BAOHU [ENVIRONMENTAL PROTECTION] in Chinese No 3 1981 pp 1-5

[Article by Zhao Zongyu [6392 1350 3603]: "Altering the Composition of Urban and Rural Energy Resources to Control Environmental Pollution"]

[Text] In recent years, because of the imbalance between the buildup for production and environmental protection, large and small industries have increased in number, and pollution of large areas in cities and villages is becoming more serious day by day. Especially because the composition of energy resources (fuel) is irrational, pollution brought about by the "three wastes" and energy losses have been very great, and must be solved. Energy resources and the environment are related to the building of modernization and the people's health and they are very important. Therefore, as the national economy is being further readjusted and during this period of further political stability, in order to stand firmly in the buildup of production and progress steadily, it is urgent that the two fundamental jobs of energy and environment be done well. In the following, several opinions are proposed as personal views as reference for concerned departments.

(I) The Question Concerning Alternation of the Composition of Energy Resources in Cities

Cities are the points of most concentrated human activity, they are also the places where science and technology and culture are most concretely manifested. Whether the composition of energy sources in cities is rational or not, whether it is advanced or not, whether it is beneficial to the lives of the people and the labor environment are all gauges of the level of modernization of energy resources in cities. Our nation's cities use coal as their main source of energy. Coal constitutes over 80 percent of the cities' energy resource, and most of it is directly burned. The rate of utilization of heat is low (15 percent), the loss is serious, and massive amounts of harmful substances and trace amounts of harmful substances including radioactive elements such as radium, uranium and thorium and other poisonous substances are released. The pollution is frightening, and urgently awaits reform. In urban reform plans to be launched soon, energy should be the key point and it should be taken into consideration. The goal of reforming the energy resources in cities is to use clean or cleaner energy resources to replace dirty energy resources, to use energy resources that are convenient to transport and to store to replace energy resources that are inconvenient to transport and to store, and to use highly efficient or more efficient sources of energy to replace energy resources with a low efficiency.

The energy resources that have not been purified or processed and which can only be used once such as the various solid combustible substances, crude oil and natural gas that contain higher contents of sulfur, nitrogen and oxygen compounds are unclean, inconvenient and uneconomical energy sources. Purified and converted reuseable energy sources and thermal electric power, hydroelectric power and nuclear power stations that have implemented effective safety measures, environmental protection measures and ecological protection measures are clean, convenient and economical sources of energy. Problems of environmental protection and economic problems related in varying degrees and in general and such new sources of energy also exist. There are many specific ways to reform the composition of energy sources in cities. Those already known are mainly the following:

1. Gasification of coal as an energy source for civilian use in cities.

Practice over a long time at home and abroad has proven that the method of altering the composition of energy sources in cities that is recognized by all, that is technically most mature, that is economically most feasible, that is most efficient for environmental protection (large areas) is coal gasification. Abroad, in industrially advanced nations, the popularization of civilian coal gas is above 85 percent (it is 98 percent in Japan, it is above 85 percent in the United States and France), and large and medium sized cities have all basically established coal gasification for a long time. Some highly modernized cities are also developing electrification. Electric power for civilian use constitutes 30 to 40 percent or more of the total amount of electric power. In our nation, the population using gas is only about 10 million people, only 1 percent of the 1 billion people. Of the 224 large and medium cities so named throughout the nation, only about 60 have relatively outdated coal gas or oil gas facilities and supplies of liquified petroleum gas. The gap between our nation and foreign nations is large. The quality of the city environment is dropping day by day, energy in cities is wasted day after day and year after year. The state's city construction departments have already paid more attention and gasification in cities is beginning. As the national economy is being further readjusted and at this moment when investment by the state and provinces and cities is difficult, if the present method of unified arrangement by the state and carying only about key points is not changed, gasification will be delayed further and may be difficult to realize. It is suggested that the General Bureau of City Construction of the State Capital Construction Commission organize the appropriate provincial, municipal and design departments to establish a city coal gassification construction company, cooperate with each other, use coal gas shares and coal gas loans to solicit funds and propose new types of designs varying in scope for coal gasification standards in cities, accept commissioned designs for city gasification and construction so that the work of gasification in cities can progress steadily and according to plans which may use some, but not a lot of the state's construction investment, so that large area pollution in key cities can be quickly controlled and the energy waste in the cities can be eliminated early.

2. Coal gasification for urban industrial energy. Our nation's industrial consumption of energy constitutes over 65 percent of the total consumption of energy. Large and small industries in the cities are relatively concentrated. Industries in large cities use 75 to 80 percent of the energy. The amount of primary energy directly burned in the various types of boilers throughout the nation reaches over 50 percent of the total energy consumption of the whole nation. Among them, 200,000

industrial boilers directly burn 200 million tons of coal, the average thermal efficiency is only about 50 percent. The nation's boilers burn 25 million tons of petroleum. After the State Council firmly demanded to substitute coal for oil, during the past two years, the burning of oil has been lessened by 5 to 6 million tons. But the oil burned away by each power network of the electric power departments is still about 13 million tons, which urgently needs replacement [by coal].

According to estimates, in 1980, the nation burned 15. million tons of petroleum (including about 7 million tons of crude oil). This amount should also be replaced [by coal] as much as possible. Because the composition of industrial energy resources is not rational, the resulting energy waste and problems of environmental pollution have become more serious and they should be reformed urgently. Coal gasification of energy resources (fuel) for industrial boilers, heating furnaces and kilns is a worldwide trend. Our nation has more coal than oil and it is an even more urgent task. Coal gasification of industrial fuel is different from coal gasification for civilian use. Civilian coal gas uses mainly medium heat value coal gas (4,000 kilocalories/cubic meter). Coal gas for industrial use can be low heat value coal gas (1,000 to 2,000 kilocalories/cubic meter). After establishing low heat value coal gas, combustion gas turbines/steam turbines can be used to establish a foundation for joint cyclic power generation to increase the thermoelectric efficiency to 40 to 50 percent and to create conditions for the development of electrification of energy resources in cities. In addition, to solve the problems of environmental pollution by oil burning boilers and heating furnaces and the shortage of oil resources, besides coal gasification of energy for industrial use, coal liquefaction is also in the research and experimental stage (with or without transition through COM coal and oil mixtures). Power stations burning oil are not interested in coal gasification mainly because they are unfamiliar with the operation and they have difficulty handling such operation. If coal gas supply companies can be established with investment by the power industry or with bank loans and if they can sign supply contracts with the power plants, then under the guidance of the national policies of limiting the use of oil for fuel because of the shortage of oil resources, the power industry will be glad to cooperate and do the work of burning gas well.

3. The questions concerning the supply of gas for civilian use utilizing natural gas, gas produced in oil fields and liquefied petroleum gas must be considered first in regions which have oil and gas fields, oil refineries and petrochemical plants. According to surveys conducted by the Comprehensive Survey Committee of the Academy of Sciences, the use of natural gas to supply civilian use can save about three times as much coal as boilers. The use of liquefied petroleum gas to supply civilian use can also save about three times as much coal as boilers. Therefore, it is far more economical to use these energy resources to supply civilian use and they will be more beneficial to urban environmental protection. This can only be realized when concerned units increase their understanding of the importance of environmental protection give play to the great cooperative spirit of socialism, and there is vigorous support by state policies (including energy price policies).

4. The massive amount of low temperature surplus heat, including cooling water of 40° C to 50° C which is relatively difficult to utilize, waste steam, surplus flue heat (converted to low temperature water) can all be used in the network of pipes supplying heat for civilian use and for medium and small industrial and commercial

enterprises in cities. Obtaining heat sources without increasing the supply of fuel will greatly benefit energy conservation and environmental protection in cities. This can be realized only by developing the superiority of socialism and if the state or the localities establish some regulations for energy conservation.

5. New energy resources which may be utilized should be appropriately developed and the composition of energy resources in cities should be improved. Our nation has many regions which have exploitable geothermal energy. Over 2,700 localities with exposed geothermal energy have been discovered throughout the nation. Geothermal energy discoveries have been made in each China, the northeast, the Hanzhong region, Xizang, Yunnan, Guangxi, and Guangdong, Fujian, Hunan, Xichuan and Taiwan provinces. Some are in cities and suburbs (such as Beijing and Tianjin cities) which are convenient to utilize. Our nation's solar energy resources are also relatively rich. Most of the regions have over 2,200 hours of sunshine throughout the year. Collective facilities in cities (including offices, residence halls, enterprises) can utilize solar energy to provide heat, for cooling and air conditioning. Most of the new energy resources are not concentrated, the supply of energy is unstable, the investment in facilities is large, large scale utilization is still difficult but they are suited for small scale utilization and they are being developed at an accelerated rate at home and abroad. Utilization of oceanic energy, wind energy and biological energy and such energy resources by the cities is limited, but they are more suited for utilization by farm villages. But utilizing garbage for generation of electricity or for gasification in cities is a necessary measure for environmental health. Such facilities have been established a long time ago abroad and the municipal authorities should actively realize this.

6. Establishment of nuclear power stations in key cities, especially large cities that have a shortage of coal, less electric power, no oil and where the environmental problem is serious must be actively realized so that the composition of energy resources in cities can be reformed to advance towards electrification and gasification. Nuclear power stations have already proven now that the technology is mature, they are economically feasible, they are clean and safe, and they can provide energy on a large scale. Our nation has a relatively rich reserve of uranium resources that have already been discovered. Also, we have already trained some reactor research, design and construction teams, and we have the basic capabilities to develop nuclear power generation with our own efforts. Economically, investment in nuclear power is generally 50 percent higher than the investment required for building thermal power stations, but with the fuel supply system of the thermal power stations, the investment may even be larger. Nuclear power generation may cost 20 to 50 percent less than thermal power. The greatest benefit is that building one nuclear power station with a capacity of 300,000 kilowatts can save 1 million tons of coal a year, reducing the amount of shipment of 1. million tons of coal and 200,000 to 300,000 tons of ash and dregs. At the same time, nuclear power stations do not have a combustion process, there is no release of chimney gases and harmful substances. The effects of radioactivity under a series of safety measures is negligible, several times less than the radioactive pollution from uranium, thorium and radium contained in the unsettled ash produced by a coal fired thermal power station of the same scale and similar to the radioactive pollution released by an oil fired power station.

7. Alteration of the composition of energy for passenger transportation in cities should not be delayed. Passenger transportation in cities develops as

modernization of cities develops. Motorized vehicles continue to increase, the energy consumption continues to rise, and pollution becomes more serious. Pollution due to exhausts from vehicles with internal combustion engines in cities mainly pollutes the air several meters above the road surface and it is extremely harmful to the city residents. According to statistical data compiled by the engineering design institute of the Tianjin City Administration, the amount of transportation in cities has a definite proportional relationship to the value of industrial production, the square meters of capital construction and light industrial products. Abroad, private vehicles develop rapidly, because of a shortage of petroleum, this development has reduced, and the benefits of energy conservation of mass transportation is being advocated, but old habits are difficult to change and the results cannot be predicted easily. Our nation's social system is different, mass transportation is the main means of transportation and it can more easily be realized. But according to understanding, vehicles for private use by each department are developing quickly and there are already over 1.35 million units. The rate of utilization of private vehicles is low, their consumption of energy is 40 percent to 50 percent higher than special transportation vehicles and they constitute 87.7 percent of the nation's total number of vehicles. In Beijing, there are already 200,000 to 300,000 internal combustion vehicles of various types and the annual growth rate is about 10 percent. Annual consumption of gasoline is about 580,000 tons. The pollution by automobile exhaust is indeed serious. Pollution in Shanghai, Tianjin and such large cities is not less than Beijing. The ways to solve this problem are as follows: (1) Trolleybuses, electric subway trains, and elevated electric trains can be used so that electricity can replace oil fuel, thus altering the composition of energy for passenger transportation. (2) Collective traffic management can be strengthened, public transportation and collective transportation should be expanded as much as possible. This can increase efficiency by over onefold. (3) Bicycle lanes or traffic regulations for bicycles should be established to replace motorized power by human power and to use food energy to replace oil energy. This can increase the energy efficiency by several orders of magnitude. (4) The fuel itself can be altered to reduce loss during combustion, such as utilizing active-combustion, highly refined petroleum fuel for internal combustion engines. (5) Non-polluting or slightly polluting petroleum substitutes can be used as fuel, including gasohol produced from coal as the raw material, methane or ethane, or mixed alcohols. (6) The gases produced by refineries and petrochemical plants as by-products can be used as raw materials to produce such high octane additives which have a high purification power as methyl tertiary butyl ether (MTBE) and tertiary amyl methyl ether (TAME) can improve efficiency and can also prevent pollution. (7) An ideal and clean fuel for internal combustion engines is liquefied hydrogen which can be used as a substitute for gasoline. Hydrogen resources are plentiful and it can be obtained anywhere, but the cost of production is high and this is very difficult to realize. In recent years, because of the development in hydrogen manufacturing technology and the jump in oil prices, according to informed sources, some nation's cost for each liter of liquefied hydrogen has approached that of the same volume of petroleum. In the long run, the use of liquefied hydrogen as fuel is technically and economically feasible and also suits the demands of the time, and it may even be unavoidable.

In general, to enable city people to enjoy a healthy life and working environment and to elevate the efficiency of utilization of energy resources to a rational level, the composition of energy resources must be altered. To assure a safe, steady, economical and effective supply of energy resources in cities, measures should be suited to local circumstances, the structure must be multivariate, there must be comprehensive utilization, there must be a major source and secondary sources, priorities must be assigned in order of urgency, and the future must be combined with the present in the development and realization of the goals.

(II) Alteration of the Composition of Rural Energy

The several major problems related to rural energy resources that require urgent solutions are as follows:

(1) The supply of energy to the 800 million farmers still has to be arranged. There are 80 to 100 million farm families that lack fuel for burning three to five months out of a year. The problem in farm villages of "worrying not about what is in the pot but what is underneath the pot" must be urgently solved. (2) Because of a lack of fuel, farm villages mainly depend upon plant energy such as straw, dung, wood and grass for their energy, thus fertilizers of organic matter, nitrogen, phosphorus, potassium cannot be returned to the fields, the soil texture becomes progressively weak, per mu yield has to be maintained by chemical fertilizers, and the situation is critical. (3) At the same time, the make-up of energy resources in farm villages is too irrational. Tools to harness energy are very backward, efficiency is too low and the waste is too great. For example, the thermal efficiency of the stoves in farm villages is only 10 to 12.5 percent. This must be changed. (4) Houses in farm villages are simple, the stoves are primitive, and pollution from burning is serious. (5) Because of a shortage of burning fuel, grasslands and mountain forests have been felled and exhausted, and the ecological balance has been seriously destroyed. (6) Also, processing enterprises of agricultural sideline products have continued to develop, small industries in cities have moved to the countryside, energy resources and environmental protection were not emphasized, and all of these are increasingly threatening the health of farmers and the ability of natural purification in farm villages. In my opinion, these suggestions can serve as reference in changing the composition of energy in farm villages and in increasing the efficiency of energy resources to give us back our "green ocean."

1. The state must take charge of the supply of energy affecting the 800 million farmers and environmental protection, organize concerned sectors and related scientific and technical personnel to study and establish a far sighted and practical strategic blueprint and policy guidelines for rural energy and environmental protection, and draw up a short term (for example up to 1990), a medium (up to the year 2000) and a long range (up to the year 2020) draft for rural energy and environmental protection based on the above. Some people have suggested that the State Energy Commission and the State Agricultural Commission organize studies in environmental protection strategy, policies and plans. Each province and city should also establish corresponding agencies to push forward such work.

2. The state and the localities must be determined to assign a part of the commercial energy resources (at present, this is mainly coal fuel) to communes and brigades for cooking so that straw, animal manure, firewood and such organic substances can be returned to the fields and for increasing the production of useable methane. According to surveys conducted by the agricultural engineering design

institute and the Anhui provincial survey of the Huaibei region, these measures can retain fertility of the soil and can also conserve the use of chemical fertilizers, reduce energy consumption for massive production of chemical fertilizers, they can also protect mountains, forests and plants, prevent leaching and prevent the land from becoming sandy. According to estimates, the gain from increased yields and from conservation of energy resulting from these measures is sufficient to more than balance the transfer of commercial energy. The precious experience should be quickly and energetically propagandized, summarized, popularized and realized.

3. Rural communes and brigades are scattered throughout the entire nation, the energy resources are different, the composition of energy resources should be suited to local circumstances and combined with the actual situation and be selective. At the same time, farming families are scattered, the dwellings and facilities are simple, the experience in using energy is insufficient, the reward from labor is low, the conditions for energy supply should be taken care of. Therefore, the supply of energy to farm villages should be multivariate combination and comprehensive utilization, there must be primary and secondary aspects, the energy must be safe and clean, convenient to use, and it must also be economical and rational and beneficial to conservation. For this, (1) besides strengthening management and increasing the efficiency of energy production by the existing small hydroelectric power stations, small coal kilns and small methane pits, they should also be continuously developed to expand the energy supply to communes and brigades. It is known that our nation has a total of about 70 million kilowatts of small hydroelectric power resources that can be exploited, and those that have already been exploited constitute only about 10 percent. Coal and other combustible mineral resources are found in each province throughout the nation. There are now 1200 counties which have built over 20,000 small coal kilns, 18,000 of which belong to communes and brigades. They produce about 100 million tons of coal. The whole nation has built about 7 million methane pits, but there are one-third that require maintenance and repairs and are "sick pits." (2) Clean bottled fuels such as liquefied petroleum gas are most suitable for use by scattered families in farm villages. Liquefied petroleum gas should be transferred to the farm villages for use when coal gasification in cities is developed and when the supply of electric power to cities can be increased. (3) The farm villages have better conditions for small scale utilization of solar energy, geothermal energy, wind energy, tidal energy. These are all inexhaustible and they can regenerate new energy. But the investment in the facilities for the utilization of these energy resources are frequently larger, so simple, easy, economical and practical methods must be studied. These energy resources can only be popularized under the massive support of national policy. (4) Solar energy is the most significant among the rural energy resources that can regenerate new energy and that has the best conditions for development. Over two-thirds of the nation have over 2,200 hours of sunshine yearly. Solar energy resources are very rich. If solar energy can be utilized well, a lot of improvements can be made in the rural energy supplies and in environmental health. Solar energy is similar to other regenerative natural energy resources. The energy resource is too concentrated, the supply is unstable, and the facilities for utilization require large investment. Under ordinary conditions, it is very difficult to compete with ordinary energy sources, but under specific conditions it can serve to supply heat and used for cooling and air conditioning. Our nation already has solar energy powered heating facilities. It is suggested that

studies and explorations in the use of solar energy in rural areas should be launched on this basis to first design an economical, practical and simple solar energy heating facility suitable to the conditions of our nation's rural areas.

5. [sic] "Green energy resources" should be actively developed to solve the problems of rural firewood and regional environmental protection. For example, timber forests, protective forests, economic forests, firewood forests, and bamboo forests can all provide energy for farm villages through photosynthesis and can improve the ecological balance. At present, 5 percent of the total world energy consumption is provided by timber (mainly used by developing nations for domestic firewood). Timber is a renewable energy resource, and if managed well, it is inexhaustible. Because of the energy crisis, "green energy resources" are gaining more and more attention and they are being developed. Research in dense planting of fast growing firewood forests and oil bearing plants is being carried out and forest farms are being established, the age-old dry wood distillation industry has turned to utilizing remnants from felling and processing to manufacture synthetic gas and synthetic alcohol, and other such liquid fuels. Our nation now has 55 million mu of firewood forests, there are another more than 1 billion my of wasteland suitable for afforestation. With the addition of small plots suitable for afforestation and the "four sides" for planting trees, the condition for developing firewood forests is very good. According to estimates, the yield of various firewoods in our nation totals about 160 billion jin, this amount can provide the firewood needs of the 800 million farm village population for over two months. It is known that the forestry ministry has drawn up a plan to develop forest wood. After the plan is realized, 300 billion jin of firewood can be harvested each year and this amount can solve the problem of firewood needed by a rural population of 900 million.

6. Rural energy must not exclude coal gasification. The processing industry for agricultural sideline products in communes and brigades is developing. Small industries are moving out of the cities to the suburbs. Some concentrated regions of small enterprises will be formed and following this will be regional pollution and waste of energy resources. The best strategy is to suit the measures to the locale and utilize local coal resources or coal resources of nearby regions to build coal gas facilities and utilize coal gas generating furnaces that use air as the gasification medium. The heat value is about 1,200 kilocalories/meters^3, the structure of the furnace is simple, operation is safe, management is simple, and gas generators from small chemical fertilizer plants can be easily converted. It is possible that many gasification furnaces of this type are being used in large factories and can be transferred.

7. Substances abandoned by the processing industry for agricultural sideline products such as waste vegetables, fruits and meats left after processing are all combustible organic matter. They can be provided to produce methane or gasification or directly burned to produce heat and electricity. If the cities do not establish their own thermal power stations by utilizing city garbage, the garbage can be sent to the farm villages for treatment. The cities and villages can work together to change unless things into things of value. In the future, after straw is returned to the fields, the need for organic fertilizers by agriculture will lessen and abandoned substances from processing of rural products can also fill the need as raw combustible materials for gasification and power generation.

8. Fully developing the function of agricultural manpower and fully utilizing animal power and energy resources and slowing all unnecessary mechanization are effective measures to conserve energy in agriculture and to prevent pollution of the farm villages for a long time to come. According to estimates, the manpower resources in our nation's farm villages total an equivalent of 2.4 x 10^7 horsepower and 3.5 x 10^7 animal power. Manpower is calculated on the basis of working eight hours a day, 300 working days a year, converted into horsepower/hour. If this is done by diesel engines, 11 million tons of diesel fuel must be consumed. Animal power is calculated on the basis of working eight hours a day, 150 days a year, converted into horsepower/hour. If this is done by diesel engines, 7.98 tons of diesel fuel must be consumed. The total of the two amounts to a consumption of 18.98 million tons of diesel fuel (nearly 20 million tons). Our nation now has about 200 million horsepower of motorized farm machinery power, more than three times that of the sum of manpower and animal power, but the actual results are only one-half that of the sum of manpower and animal power. Therefore, at present and for a long time into the future, under the concrete and practical conditions of energy resources, employment and natural conditions, full development of our manpower and animal power makes sense.

In general, we must on the one hand solve such pressing problems as insufficient rural energy supplies, lack of fuel for commune members, cold meals, and on the other hand, the irrational situation which exists in the use of energy. Waste is serious, the ecological balance has been destroyed and these problems urgently require that the state and the concerned leading units of the provinces and cities concretely control the energy resources in farm villages and include the supply of rural energy in their plans so that straw can be returned to the fields, the amount of chemical fertilizers used can be reduced, the per mu yield can be increased, and the environment can be protected. The gain from such conservation is more than sufficient to balance the energy invested. But to reduce the labor intensity in agriculture, to improve production efficiency, to conserve energy used by agriculture, reform of presently available farm machinery and the study and introduction of necessary advanced technologies are also work that urgently needs to be launched.

BRIEFS

JILIN GOLD OUTPUT--Hunchun Gold Mine in Jilin Province had fulfilled its annual production and profit plans by 15 September. On 16 September, its gold output surpassed the figure set by the annual production plan by 4.2 percent and the figure set by the annual profit plan by 70 percent. PRC JOURNAL ON MERGING CIVIL, MILITARY INDUSTRY

HK070743 Beijing JINGJI GUANLI in Chinese No 7, 15 Jul 81 pp 35-37

[Article by Huang Qiuyan [7806 3061 3601] of the Yunnan Economic Research Institute: "The National Defense Industry Should Take the Road of Integrating the Military and the Civil"--note passages in slantlines denote boldface type]

[Text] Since the founding of the state, the national defense industry in Yunnan Province has had considerable development. It has become a major industrial department. This department has three main characteristics: The first point is that it has a lot of good quality equipment. The provincial military enterprises have a relatively high proportion of the total number of lathes in the province. A large part of these lathes are large-scale, highly accurate and of superior quality. They also have a lot of imported equipment. The second point is the strong technological force and relatively high standard of technology. They also have a lot of senior laborers and technicians. According to preliminary statistics, there are 11 technicians for every 100 staff and workers in the provincial national defense industrial system. For every 100 scientific and technological personnel, there are 20 assistant engineers or more as the backbone, a technological force twice to three times that of civil industry. The third point is the high production capacity and high assimilation potential. This potential of the national defense industry has an important impact on and makes a considerable contribution to the building up of socialism and the struggle for national defense. In the last 2 years, it has also worked hard on developing civil products. A lot of work has been done, and good results have been achieved. According to statistics, the value of civil goods produced in 1980 takes up 44.8 percent of the total production of military industrial enterprises. It has grown 22.7 percent compared to 1979. There are four categories of civil commodities that are being trial manufactured and produced, namely: Light industry, electronics, mechanical engineering, and optics. The variety of specifications amounts to more than 300, including model 130 vehicles; 35 mm movie cameras; new collapsible telescopes that can magnify by seven times; microscopes for surgery and gravure printing. These are all included in the national plan. Some products make their way onto the international market. The new collapsible telescopes that can magnify by seven times for instance are selling well in Europe, America and Southeast Asia. They have in recent years earned $1.8 million of foreign exchange. At the same time, it has earned some experience through work which, as it is initially understood, basically includes the following points:

//1. It hinges on the weak links of the national economy in arranging the production of civil commodities.// It should take into account the demands of the people's livelihood in both cities and countryside, market shortages and the export trade as well as the technological restructuring of all sorts of trades. On this basis, it should actively organize and arrange the production of civil products, particularly consumer goods. Last year, most of the production of civil goods was marketable. Of these, the consumer goods which serve light industry constitute half of the total output value of civil goods.

//2. Promote the characteristics of production skills and select production of marketable products.// In choosing models for civil goods and accepting orders: (1) insist on the principle that they should be commensurate with the skills and equipment of the enterprise concerned and be able to give play to the production characteristics of the enterprise concerned; (2) adopt the integration of the short, medium and long term as well as the integration of big, medium and small batches. The Xinan Changzheng mechanical plant, for instance, treated the production of 35 mm movie projectors as relatively long term civil "specialized" products. Record players are treated as medium term products and television antennae as temporary minor commodities. Apart from achieving balanced production, it can also take one step forward while looking three steps ahead and maintain a steady and continuous advance.

//3. In organizing production of civil goods, speed should be emphasized.// An early, quick and new grasp must be taken of marketable products. The Xian Changzheng mechanical plant last year, for instance, firmly grasped the trial-manufacture of new products and rationalized the production lines on the one hand. On the other it pushed the sale of products. The newly marketed products include 35 mm movie projectors, polluted water treatment plants and radio-tape recorders. They were all trial-manufactured, tested, put into small-volume production and put on the market in the same year. As a result, some commodities are selling well and demand exceeds supply.

//4. Develop the advantageous position of the high technological standard and good equipment of the military industrial enterprises, tackle the new, high quality, precision top-notch products that demand a high standard of craftsmanship and technology and which can be handled by the enterprise concerned.// The Xinan Yunshui mechanical plant produced high-pressure hydraulic valves for the electricity department. This filled a shortage in our country and has also become a "first" product of our enterprises.

//5. Develop the autonomous spirit of enterprises and handle tapping potential, renovation, restructuring and develoment of civil goods production.// The Xian Changzheng mechanical plant ran out of factory space for production of record players. The garage was then spared and converted into a workshop. There was no equipment for the production of aluminum parts for movie projectors, so the existing well-type blast furnaces were used instead. This has saved time and saved money for the state.

//6. Grasp "first" products and constantly improve product quality.// Last year, new products included a bunch of civil goods like sewing machines, watches, typewriters and toasters which, after relentlessly grasping quality control, production sequence and rejecting. Goods of inferior quality, before they leave the factory, have earned a fairly good reputation. Of these, model 135 calculators, crystal tube gas pumps, and so on, were rated as the best products in the province and some even received commendations from the central departments concerned.

//7. Repair the old and utilize waste, comprehensively utilize various resources to develop the production of civil products.// Some enterprises make use of leftover materials, overstocked raw materials and electrical parts to produce sundry metal goods and consumer goods. These include semiconductor radios, magnifying glasses, dies, lenses, washing machines, wooden and metal furniture, and so forth. This meets the demand on the market.

However, all this is only the beginning of the production of civil goods by the military industrial enterprises. The existing potential and advantageous position of the Yunnan military industrial enterprises have not yet been fully exploited by a long way. The utilization rate of technicians is generally fairly low. According to a preliminary survey, the productivity of each metal cutting machine is almost half of that of its civil counterpart. The labor productivity of all the personnel is 38 percent lower than civil industry. The circulation funds in military enterprises for every 100 yuan worth of production is about 100 percent more than in civil enterprises. The fixed assets involved are 170 percent higher than in civil industry and the profit for every 100 yuan of output is about 50 percent lower. Some military industrial enterprises suffer from losses on the one hand, and have idle manpower, resources and advanced equipment on the other. This is so-called "holding a golden rice bowl and waiting to be fed." The main reason is that our nation's military industry management system has formed a separate entity which is quite independent of the civil industries. An immense gap has opened up between the military and civil industries. Those manufacturing military goods cannot deal with civil goods. Practice has proved that the disadvantages of this system outweigh the advantages. The investment of the country is big but the economic effect is poor; readjustment and reform has to be carried out. Regarding the orientation of reform, I consider it necessary to break down the barriers that separate the military and civil sectors. The existing military industrial enterprises would have to evolve from unitary production of military goods to a dual production structure for military and civil products. The military and civil sectors should combine to develop production, so as to produce both military and civil products. Taking into account many industrially developed countries abroad they have long since practiced a unified approach to the military and civil sectors. In the United States, for instance, the making of military and civil goods are undertaken together, with the exception that explosives and a small quantity of specialized military products are produced by specialized plants, nearly all these military goods are produced by contractors working on government contracts. The civil enterprises that are engaged in military production account for about 80 percent of the aircraft industry, about 60 percent in shipbuilding, 34 percent in electrical engineering and 28 percent in general mechanical industries.

The military industrial enterprises taking the road of military and civil cooperation is an objective demand in the process of socialist economic development. It is a long-term strategic target of the "four modernisations" construction. It is also a major component of industrial readjustment and reform of the industrial management system.

However, to realize the unification of the military and civil sectors in the light of the existing conditions of the military industrial enterprises in Yunnan Province, the following aspects of work has to be achieved:

//1. Go one step further in emancipating the mind, eliminate "leftist" influence, and raise the military industrial enterprises' awareness of both the military and civil sectors, and military and civil cooperation.// First, it is necessary to resolve the question of ideological understanding: 1) is to overcome the "supply system" ideology; 2) is to rectify some incorrect viewpoints. For example, some think that the military handling civilian products is "not engaging in proper business," as well as an additional burden. Some also consider such an approach as a short-term expedient measure. Some worry that "confusing the structure of the organization" will affect the building of national defense. Some think that the military industry is degrading itself in producing civil goods. These problems of ideological understanding, if unresolved, will adversely affect the active integration of military and civil enterprises. Moreover, the military industrial enterprises should adopt an entrepreneurial approach and change from using purely administrative methods to manage enterprises to adopting suitable economic measures to manage enterprises so that the military industrial enterprises may get the maximum economic effect with the minimum waste.

//2. Relentlessly grasp readjustment and work well.// First, resolutely readjust the capital construction front. For the military industrial enterprises to develop production of civil goods, they have to make full use of existing conditions and exploit their internal potential. In handling ongoing projects, it is necessary to resolutely drop, stop or suspend them under appropriate situations. The enterprises' funds for specific purposes like tapping potential, renovating and restructuring, must be kept for the purpose for which they were intended and are not to be diverted from capital construction projects. As regards the scale of construction and orientation of utilization of the funds retained by localities and enterprises for their own use, they should be reported to and vetted by the state and the directing departments.

In addition product structure should be readjusted well. Closing, suspending, merging and shifting must be done well. The readjustment should ensure that the production of military equipment and scientific research, design, experimenting and verification of military industry should be given priority for completion. It should be condusive to satisfaction of the demand for people's livelihood and rapid expansion of consumer goods production. In this way, the supply of commodities on the market will be increased. At present an integrated analysis and evaluation should be conducted over enterprises that produce military goods which are in excessive supply but that are seriously deficient in their production assignments. Some enterprises produce inferior goods of high price and unmarketable goods. Some enterprises have suffered losses for a long time and fail to see the effects of rectification. Some enterprises develop too slowly and do not have normal conditions for production or their production targets are unsettled. After such analysis and evaluation, closing, suspending, merging and shifting should be carried out according to different situations. Some products that are of good quality and low cost, marketable and competitive in international and domestic markets and that are in short supply should be stepped up. They should forge ahead toward the goal of high, big precision and top-notch, and production of goods in short supply should be tackled.

//3. Practical conditions should be taken into account in determining the form of merging of the military and civilian goods production.// The form of coordination should be principally toward coordination, but should distinguish between different situations, so that there is both division and coordination. The following forms of coordination may be taken: (1) Coordination at the upper levels, division at the lower levels. This means the provincial machine building industrial committee or the head office produce various types of military goods as well as civil goods. Below these two organizations, military branch control organs or military branch companies should be established. While coordination at the upper levels is the fundamental form, the subdivisions at lower levels should cater to the specific demands of military goods and carry out specialized management. (2) Coordination of manufacture and division of design. This means the design of products on paper should be carried out separately but different manufacturing units should be coordinated. (3) Processing should be coordinated, assembly should be diversified. For spare parts for military and civil goods, items involving similar or equivalent spres and craftsmanship should be processed together. But at the stage of packaging, they should be separated. (4) Coordination of hardware, division of software. The production of software should be separated from that of civil goods and be treated as classified. Hardware that is basically the same, should be produced together with civil goods. Military goods that require special functions should not be forced into the same production process as civil goods. There is however a special condition for these few forms of coordination. They must be undertaken according to the principle of economic rationality and must facilitate the development of production as well as the construction of the economy and the construction of national defense. Enterprises under the company may extend from military goods to civilian ones; or emphasize both equally. They may also incline to or completely gearup to civilian goods.

//4. It is necessary to positively and steadily carry out systems reform that facilitates readjustment.// In order to turn enterprises into relatively independent commodity producers and maximize the mobilization of the massive working population, it is necessary to separate the executive body from the economic management body. Solid proposals include: breaking up of departmental and regional barriers. The provincial national defense industry office and its branches (excluding special bureaus and companies) and provincial machine building plant and provincial agricultural machinery bureaus should be abolished. A "provincial machine building industry committee" should be formed by the various concerned departments. Its chief mission would be the checking and supervision of all organizations within the machine building industry system (including the national defense industry) in thoroughly executing the state's guidelines, policy, and statutes. It should also formulate the scope of economic development of the entire machine building industry and its policy of economic technology. It should also guide, mediate and determine the various organizations. It should also organize and check all major setups, technological reform, conducting of scientific research projects and provide internal economic data. It should organize the exchange of experience, training of professionals and carry out instruction on work. Under the leadership of the "provincial machine building industry committee," the scattered "big and complete" and "small and complete" enterprises under the parent factories and operational bureaus will be rationalized gradually and according to the principles of economic coordination, industrial system, coordination between specialized departments and economic rationality, different types of cooperative entities will be formed--specialized companies of an enterprise nature and joint venture companies. The road of coordination between specialized departments and economic cooperation will be taken.

//5. To enhance its function as an economic lever, promote development of civil production.// The production and marketing of civil goods by military industry enterprises should be subject to the corresponding industrial and commercial merchandial taxes and gains tax. For the sake of encouraging military enterprises to positively organize civil production, a certain amount of support and tax concessions, should be allowed. This means a reduction of tax under various conditions or fixed reductions. The transaction tax involved in processing and installing of parts should be waived. In terms of prices and sales, the leftover resources from military products, original pieces and installed products should be utilized by enterprises in civil production at a lower price. For production of light industrial products arranged by the upper levels, enterprises should be allowed a certain amount of autonomy in sales. On the issue of opening up competition, the upper level supervisory departments should strengthen overall balance and planned guidance, promptly provide economic information on various types of products to different regions and industries within the country (including production capacity, prices, quality and nationwide supply and demand). Irrational actions resulting from one-sided development of overwhelming position of certain enterprises should be avoided. On the issue of foreign trade, monopolies and sectoral splits should be changed. Uniform leadership and diversified operation should be practiced. Enterprises should have greater powers to negotiate with foreign merchants so as to mobilize the positive function of enterpises concluding contracts for orders with foreign merchants.

BRIEFS

TEXTILE OUTPUT VALUE--Beijing, 19 Sep (XINHUA)--In the first 8 months of 1981 China's textile industry produced textile goods with a total value of 50.1 billion yuan, a 14,88 percent increase over the total output value in the first 8 months of 1980. [Beijing XINHUA Domestic Service in Chinese 1250 GMT 19 Sep 81 OW]

HEILONGJIANG COAL OUTPUT--As of 28 September, provincial collieries whose products are distributed under the unified state plan, had overfulfilled the third quarter coal production plan by 20,000 tons. The average daily output increased 1.8 percent over the corresponding 1980 period. In the first 9 months of 1981, these collieries overfulfilled the raw coal production plan by 970,000 tons--a national record. [SK301004 Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 29 Sep 81]

JILIN TEXTILE INDUSTRY--Eleven textile industrial enterprises in Jilin Province have constructed and expanded production projects, installing a number of machines and making it possible to increase the annual production capacity of cotton yarn by 20 percent, woolen yarn, 100 percent; and dyeing and printing cloth, 10 million meters. Production capacity of other textile products such as knitted goods, silk and chemical fabrics has also slightly increased. NATIONAL CONFERENCE ON CONSTRUCTION IN ENTERPRISES CONCLUDES

HK040652 Shijiazhuang Hebei Provincial Service in Mandarin 0400 GMT 25 Sep 81

[Summary] The state capital construction commission opened a conference on political work in construction enterprises throughout the country in Tangshan Municipality, Hebei Province, on 14 September. The conference lasted 10 days and closed on 24 September. The participants visited certain factories and new construction sites of Tangshan Municipality. "Han Guan, minister of the state capital construction commission, submitted a report to the conference, (Xiao Tong), director of the state general bureau of construction, (Xiao Jingwa), director of the state general contracting bureau, and Kang Yonghe, general director of the state labor bureau, spoke at the conference." Li Jingzhao, vice minister of the state capital construction commission, gave a summation speech at the close of the conference.

The participants held: The No 2 construction company in Handan Municipality of qualified to be considered as a good example in simultaneously grasping production, political work, enterprise management, rectification of the leadership group and implementation of the production responsibility systems. The conference held: The most pressing task at present is to rectify well the enterprises and build up a strong work force in order to improve the political quality of the force, and its economic effect and social prestige. We must build the national construction force into a force which possesses advanced ideology, technical experience, strict discipline, and scientific management and which is united to strive for the building of the four modernizations.

The participants unanimously pointed out: "We stress working in accordance with the economic laws, however, we must also strengthen ideological and political work. We must resolutely overcome the state of being lax and weak in ideology and in leadership. We must properly criticize when necessary, and carry out appropriate struggles against wrong tendencies in violation of the four basic principles and various unsavory trends."

In the course of pushing forward the economic responsibility systems, we must also stress correct ideology. We must educate the cadres and the workers to build up the sense of responsibility of being masters of the house and correctly deal with the interests of the state, collective and the individual.

The conference held: "Rectification and building of the leadership groups is the key to rectifying well the enterprises, building a strong force, strengthening ideological and political work and pushing forward the economic responsibility systems." We must work in accordance with the instruction of the Central CCP Committee and promote young, capable and learned staff to leadership posts.

BRIEFS

HOUSING CONSTRUCTION PACE--Beijing, 1 Oct (XINHUA)--Housing construction in the Chinese urban areas has been progressing at a fast pace in the first three quarters of 1981, a spokesman of the State Capital Construction Commission said. The amount of investment in housing construction, and the floor space of housing under construction and completed in the first eight months approached the level in the corresponding period of 1980, a record year for China's urban housing construction, he said. "The new achievement," he noted, "was made despite the cut in China's total national capital investment for the current year." Between January and August, housing starts covered 87.78 million square meters while housing completions totalled 19.51 million square meters. The State Council approved an additional investment of 3,000 million yuan pooled by the localities and enterprises for the housing programs, the spokesman added. Funds pooled by enterprises accounts for more than a half of the total housing investment this year. In some provinces, the percentage has risen to 60 or 70 percent. [Beijing XINHUA in English 0151 GMT 1 Oct 81 OW]

HEILONGJIANG HOUSING CONSTRUCTION--Heilongjiang Province has successfully advanced housing construction work. According to statistics compiled by the provincial statistics bureau at the end of August, the province has initiated its 1981 housing construction work on 3.79 million square meters of floor space. Housing totalling 690,000 square meters of floor space have been built. With the new houses which have been built in the past 3 years, the province now has new housing with 13.7 million square meters of floor space. They can accommodate 260,000 households. GUANGDONG SMUGGLING CASE--The legal department of Zhuhai Municipality in Guangdong Province recently cracked a smuggling case in which (Lu Jianming), vice secretary of Xiangzhou Fishing Vessel Shipyard Party Committee, was arrested. Since the Xiangzhou fishing vessel shipyard lies just on the border of Macao, (Lu Jianming) had the opportunity to engage in smuggling activities with Hong Kong and Macao merchants by making use of his power. In addition, he also organized a gang of criminals to steal spare parts of vehicles to refit old cars which had been imported from Hong Kong and Macao and sold them at high prices in the name of the shipyard. According to incomplete statistics, (Lu) had sold some 112 cars from October 1980 to June 1981, realizing a profit of 130,000 yuan. PRINTING MACHINE SALES EXHIBITION--Beijing, 5 Oct (XINHUA)--More than 200 printing machines from 50 printing machine factories throughout China were on display today at the Beijing exhibition center as the first national printing machinery sales exhibition opened. The director of the exhibition said that foreign manufacturers and business people are welcome to visit the fair and discuss questions of technical cooperation. He said that invitations have been sent to foreign businesses and manufacturers including dealers in Chinese printing machinery, resident representatives of foreign businesses in Beijing and commercial officers of embassies. China has exported printing machines since 1956 and they now go to more than thirty countries and regions. It is expected that total value of exports will surpass five million U.S. dollars this year, an increase of 33 percent over last year. [OW051417 Beijing XINHUA in English 1217 GMT 5 Oct 81]

PRC AVIATION ADMINISTRATION LETTER TO TAIWAN

OW061524 Beijing XINHUA in English 1506 GMT 6 Oct 81

[All quotation marks as received]

[Text] Beijing, 6 Oct (XINHUA)--The aeronautical information service of the General Administration of Civil Aviation of China (CAAC) has proposed to the International Notam (Notice to Airmen) Office of the Taiwan Flight Information Centre that they cooperate in compiling a new aeronautical information publication on China's civil aviation.

The letter which was sent in September said that the suggestion was made to help develop the civil aviation of the motherland and our common interests." It said that representatives of the Taiwan civil aviation authorities "are welcome to come to Beijing, Guangzhou or Shanghai and other places suitable to both sides. The Chinese people's government will assure their safety and free travel. We can also send our people to Taiwan if the Taiwan civil aviation authorities guarantee their safety and free travel.

If the Taiwan Civil Aviation authorities had difficulties in sending personnel to the mainland, the letter suggested contact by mail. Two copies of "Aeronautical information publication of China's civil aviation were offered which could be picked up from the CAAC office either in San Francisco or Tokyo.

On January 3, 1979, CAAC proposed to the Taiwan civil aviation authorities that there be talks on air service and indicated willingness to provide all conveniences for air service between the mainland and Taiwan Province.

In November 1979, Xu Keji, a CAAC official then in charge of ICAO (International Civil Aviation Organization) affairs, offered CAAC aeronautical information to the Taiwan civil aviation authorities and said that CAAC would like to exchange experiences with their colleagues in Taiwan. He proposed joint use of the technical date of the International Civil Aviation Organization to develop civil aviation and ensure flight safety.

The General Administration of Civil Aviation of China resumed its activities in the International Civil Aviation Organization in 1974.

IMPORTANCE OF COLLECTIVE ECONOMY IN CITIES AND TOWNS STRESSED

Jinan DAZHONG RIBAO in Chinese 3 Sep 81 p 3

/"Study of Economic Problems" column article by Qi Yongping /7871 3057 1627/: "Collective Economy in Cities and Towns Is an Important Component of Socialist Economy"/

/Text/ As clearly pointed out in the "Resolution on Certain Questions in the History of Our Party Since the Founding of the People's Republic of China," "the state economy and the collective economy are the basic forms of the Chinese economy." As an important component of socialist economy, the development of the urban collective economy is an objective necessity, since it can help develop production, bring prosperity to the market, initiate various forms of social services, and provide conveniences for people living in cities and towns.

Specifically the urban collective economy has the following special features and roles:

1. It suits our country's specific conditions. Practice has proved that developing the collective economy is consistent with our national conditions. We have a huge population and a weak economic foundation. While the national economic readjustment is going on, the state cannot afford to spend too much on developing the collective economy. In establishing collective enterprises, the state is not required to invest in the building of factory buildings and dormitories or in the purchase of equipment. Nor will the number of people consuming commercial grain be increased. The collective economy in cities and towns has such features as a large variety of trades and a broad scope of activities which occupy less land, require less investment, and yield quick results, in addition to its business flexibility, strong adaptability, and close contact with the market. It is also easy to set up collective enterprises which enjoy independence and keep initiative in their own hands; practice independent accounting, assume responsibility for profits and losses; and exercise democratic management. The result of their business operation has a direct bearing on the economic benefits of their workers and staff members. Therefore, the enthusiasm of the workers and staff members can be easily aroused.

2. It is convenient for integration and cooperation. In our country, more than 90 percent of the major industries are concentrated in 107 municipalities directly under the central or the provincial government. These municipalities also serve as political, economic and cultural centers with fairly large concentrations of scientific research organizations. For the sake of energy conservation, it is usually necessary for local

major industries to form integration and to cooperate with the collective economy in cities and towns in developing high-grade, precision and advanced production of a fairly difficult nature; in producing small products, accessories and spare parts; or in undertaking processing and auxiliary projects.

3. Collective enterprises can also fill certain gaps. In addition to the role of cooperation, the collective enterprises in cities and towns can produce many products which the major industries are incapable of producing. According to statistics, the volume of industrial goods for daily use produced by collective enterprises amounts to approximately 17 percent of the total retail sales throughout the country. More than 20,000 different products produced by these enterprises are indispensable to people's daily life which includes food, clothing, housing and travelling. Thus they are playing an important role in filling gaps.

4. As experiences in the past 20 years have proved, collective commerce in cities and towns is an important force not to be overlooked in the spheres of exchange and circulation. In 1954, there were in the whole country approximately 2.8 million peddler households. In the course of socialist transformation, the majority of them were organized into cooperatives which form an important component of the collective economy. Despite certain defects which has left behind some long standing problems, the transformation was a great success. Collective commerce in cities and towns has enlivened the market and provided facilities for production and people's daily life. Since the Third Plenary Session of the 11th Party Central Committee, collective commerce in various forms has become more active and played a more important role. In Jinan, for example, the Dongguan Neighborhood Office of Lixia District raised its own funds to set up a collective store. Its average daily sales were more than 3,600 yuan. This serves as a very good example.

5. Collective economy plays an important role in bringing prosperity to the small and medium-size cities and towns. The policy for city construction in future is to control the scope of large cities, to rationally develop the medium-size cities, and to actively develop small cities and towns. It is necessary for collective enterprises to develop not only in large and medium-size cities, but also in small cities and towns in particular. Small cities and towns have special features of their own. They are close to the countryside and serve as local political, economic and cultural centers. With better transportation facilities, they also serve as a bridge between the large and medium-size cities and the vast countryside. Because of their limited energy resources and scientific and technological know-how, they are unfit for the development of major industries; however, handicrafts, commerce, service trade, communication-transportation, and civil construction in many cities and towns are fairly well developed, and are able to provide convenience to the local people's daily life. That is why the adoption of flexible policies, the increase of trades, and the clearing of channels for the development of collective economy are of great significance to the prosperity of cities and towns.

6. It helps organize the broad masses of workers and unemployed youths in the cities and towns to participate in socialist construction. The vast majority of collective enterprises require high labor intensity. Some of these enterprises do not demand a high technological level and can provide more job opportunities. In June 1981, the State Statistical Bureau announced that if the restaurant business could return to its 1955 level, 3.7 million additional people could be given jobs. Thus if the entire collective economy could return to its 1955 level, the employment problem for more people can be solved.

From what has been cited above, we can see that, far from a temporary expedient, the development of collective economy in cities and towns is an important measure to promote production and business, to bring prosperity to the cities and towns, and to infuse vitality into the economy under the guidance of state planning and on the basis of market needs. This measure is consistent with the present level of productive forces in our country, helpful to the development of production, and compatible with the objective economic laws. That is why in the not distant future, collective economy should be developed in cities and towns, along with the appropriate reactivation and development of individual economy. Since the Third Plenary Session of the 11th Party Central Committee, many good experiences have been gained and accumulated in the development of this type of collective economy in different regions and trades. For this reason, we believe that collective economy in cities and towns can take many forms: the people's voluntary participation with self-raised funds or integration with rural enterprises to form collective enterprises. Unemployed youths can also independently form specialized or comprehensive organizations under the system of collective economy. With increased resources and an enlivened economy, it will be possible for collective economy in cities and towns to start out on an ever broadening road.

PRC ECONOMIST ON INDUSTRY, ECONOMIC REPORT

HK290134 Hong Kong SOUTH CHINA MORNING POST in English 20 Sep 81 p 16, Business Supplement

[Article by Julie Auyeung]

[Text] China is taking a new approach to its development of heavy industry--renovating existing factories instead of attempting ambitious projects of building new plants.

However, the development of light industry to improve living standards, still remains the essence of Beijing economic policy.

These were reviewed yesterday in Hong Kong by Mr Jiang Yiwei, the deputy director and research of the Institute of Industrial Economics, Chinese Academy of Social Sciences.

Mr Jiang also announced the publication of a Chinese annual economic report--the first since 1949--which will shed light on progress made during the country's economic reforms.

It is recognized that China still faces many problems and changes or readjustments are inevitable. But there are good signs and China is "steadfast" in its economic policy, said Mr Jiang.

Mr Jiang explained China is not reverting to the development of heavy industry despite reports to this effect.

However, China does not intend to let existing plants lie idle because of the switch of emphasis from heavy industry to light industry.

"Plant facilities are still there and workers still have to be paid. It is important that new technology be introduced to keep up the production," he said.

The policy is not to stop any operation, but invest sufficiently in these plants to restore their original production capacities.

He added: "Though there is a contraction in investment on heavy industry, we will still be spending some money on it. But we will not be building capital-intensive plants for heavy industry."

On the policy concerning special economic zones, the overall plan is to develop coastal regions and cities and gradually move inland.

There are reports that Beijing, Shanghai and Tianjin will be turned into special trading areas with more "flexibility" in carrying out foreign trade and cooperation with foreign business partners.

Mr Jiang said: "These cities are being given priority for development because of their background in commerce and industry. They have a leading function.

"We have to move towards inner China gradually as many of these areas have not yet reached the capabilities of the special economic zones."

In the annual economic report just published, comprehensive coverage is given on the economic achievements made by all Chinese provinces in the past 30 years.

About 150,000 copies will be circulated in China and 10,000 copies in Hong Kong at HK$200 each. The English version will be out soon while the Japanese issue will be ready next month.

There are plans to print quarterly editions starting from next year.

HONG KONG, PRC OVERSEAS CONSTRUCTION LABORER CONTRACT

HK150307 Hong Kong BUSINESS STANDARD in English 15 Sep 81 p 1

[Text] Hong Kong has now become the overseas employment agent for China after two locally-based companies reached agreement with the Chinese authorities to export Chinese workers. Zim-Chem (Far East) recently signed a contract with the Fujian Foreign Construction Company to promote and provide Fujian workers with work in overseas construction and industrial projects.

The other company, Chronicle Consultants, also reached a similar agreement with Guangdong Manpower Service Corporation in late 1979. The export of manpower is claimed by China as part of the program for Chinese workers to learn modern technology through actual practice.

However, Chinese authorities also stand to profit financially by exporting manpower. According to information supplied by Chronicle Consultants, an unskilled worker, for example, must be paid by his overseas employer 300 dollars (HK$1800) a month. His employer must also provide his transport expenses, accommodation, income tax as well as living expenses. But according to Zim-Chem's Mr Chu, the workers themselves usually only get 10 percent of this wage while their families also only get an income double their previous wages in China. Workers also get bonuses and overtime salaries. As a normal unskilled worker in China now gets about 40 yuan (about 130 dollars) a month, a large part of the wages earned by the worker--about HK1500 or 80 percent--will be shared by the Fujian authorities and Zim-Chem. Another financial benefit for China thorugh the export of manpower is that China gets hard foreign currency while it pays the families of workers in renminbi. However, both Mr Chu and Mr Nakayama of Chronicle Consultants said it does not necessarily mean that China is set to exploit its own workers. "These workers like to work overseas as they know that they can never earn as much inside China.

HONG KONG PAPER ON PRC CHANGES ECONOMIC POLICY

HK220455 Hong Kong SOUTH CHINA MORNING POST in English 22 Sep 81 p 5

[By a staff correspondent]

[Text] The zig-zagging Chinese economic policy which has confounded analysts and economists both in the country and abroad appears to have taken yet another turn, with an apparent swing back towards placing emphasis on heavy industry.

As yet, there has been no definite declaration of such a switch, but increasingly China's economists and the media have hinted at the need to re-emphasise speed in industry and a halt to retrenchment in heavy industry.

A little over a year ago, China was blaming the previous leadership, ostensibly under the leadership of the then party chairman and prime minister, Mr Hua Guofeng, for the "leftist" tendency and overemphasis on heavy industry to the detriment of agriculture and light industry.

There followed a drastic retrenchment on capital investment in heavy industry.

Overnight, many contracts with Japanese, West German and French firms were suspended, in some cases cancelled. These contracts, including the deal on the Baoshan Iron and Steel Mills, were regarded as an overextension of Chinese capital.

It has been argued that the Baoshan investment alone was so heavy that, if it were spread over the light industrial sector, it could facilitate the building of several hundred factories devoted to light industrial products such as textiles with faster returns.

Overnight, too, many construction projects devoted to heavy industrial products were suspended. Factories under construction were left to rot and installations dismantled and taken away for private use.

The emphasis, then, was on agriculture and light industry, particularly the production of consumer goods, such as sewing machines, television sets, cassette recorders, and bicycles.

Overnight, too, a whole new family of factories devoted to the production of consumer goods sprang up. Encouraged by a liberal policy that endorsed private initiative, these factories were built without much overall planning, with the result that several factories manufacturing the same goods were operating in the same region or district, to the detriment of each other.

As they competed against each other for the sale of their products they resorted to various means so that corrupt practices were so rife that they alarmed the authorities who called for strict measures to curtail the malpractices.

On the other hand, few factories would manufacture goods that did not bring a quick return, with the result that there was a shortage of certain goods.

At the same time, with the closure of many factories devoted to heavy industry such as those producing lathes and spare parts for light industry, it became apparent that as machinery in the light industrial sector broke down, it was difficult to find replacements and in certain cases, even spare parts.

The result was a reduction in the manufacture of light industrial goods in certain areas whereas in other areas, it was impossible to expand production.

Another serious side-effect was the displacement of hundreds of thousands of workers who suddenly found themselves out of a job. They still received their monthly ages, but they no longer had the benefit of overtime pay and bonuses even if they wished to work harder. Emergency measures were taken to "retrain" them but these measures were rather halfhearted.

As one economist pointed out at the time, the drastic measures as regards heavy industry were beginning to have an effect on the whole economy. There resulted an imbalance in various sectors.

Meanwhile, foreign investors whose heavy industrial contracts were cancelled or suspended expressed great displeasure and threatened retaliatory measures such as seeking compensation. This forced the administration to go back on their suspension order and resume their contractual responsibilities.

As time passed, the overemphasis on light industry was also beginning to produce undesirable side-effects.

Because the country has a vast population and because the light industrial sector could not keep up with the demands of the population, an acute shortage of popular goods occurred.

In the past, under a puritanical society, the shortage of goods meant a further tightening of the belt and the people were told to bear it in the name of "perpetual revolution." With that ideology thrown overboard, the people were demanding more and they meant to get what they strived for.

The shortage of goods, even though the authorities were doing their best to produce them, contributed to another phenomenon which was nonexistent in the past: inflation. And blackmarkets flourished everywhere.

By January this year, the situation was so serious that the State Council had to issue a 10-point directive on industry. Apart from stressing that all major capital construction projects must be approved by the State Council, the other points dealt largely with the problems that were themselves the products of the readjustment program, such as the need to unify the bonus award system, the need to unify control over finances and taxes and the readjustment of commodity prices.

Another directive stressed that market adjustments must be carried out in accordance with national plans--a clear indication of the lack of control in regional planning and a free-for-all investment policy.

By late spring the ill effects of the over emphasis in light industry became even more pronounced while the heavy industrial sector showed stagnation.

By late summer, it became apparent that coal production could not meet the target the State Council set for it last year and the coal minister, Mr Gao Yangwen, had to make a selfcriticism.

Behind the scene, a debate was raging as to whether the policy of going full-steam ahead with light industry and drastic retrenchment in heavy industry was the right one.

And since April, the media began to stress that there should not be an excessive demand on the speeding up of capital construction.

Although the media laid the blame on "excessive demand" many analysts said the real emphasis ought to be, once again, the need to develop capital construction.

This was in sharp contrast to the widely publicized decision late last year that there should be drastic cuts in capital construction--a branch of heavy industry.

By August, the emphasis appeared to be on both light industry and heavy industry. This was borne out by a statement to the Hong Kong press by a State Council vice premier, Mr Gu Mu, that retrenchment in heavy industry had already reached its peak and there would not be any further retrenchment.

The shift of emphasis on economic policy also had a parallel development on the political side.

Mr Gu early this year had to shed his charimanship of the state capital construction commission, and three other top State Council officials, including the former State Planning Commission chairman, Mr Yu Qiuli, had to take a back seat when they lost out in their advocacy for heavy industry.

They were replaced by a new economic team who was in favor of the development of light industry. The "new" team was led by the party vice chairman. Mr Chen Yun, and included, among others, the present chairman of the State Planning Commission, Mr Yao Yilin, the prime minister, Mr Zhao Ziyang, whose Sichuan economic experiment was widely hailed.

With the perceptible shift to heavy industry, the fortunes of the new team appear somewhat eclipsed.

Apparently angry with the shift, Mr Chen Yun, who was the champion for light industry and a severe critic of heavy industry, moved to Hanzhou. Mr Yao has made fewer appearances or received foreign guests and it was left to Mr Zhao to explain the nation's future economic policies to visitors.

On the other hand, those who previously advocated emphasis on heavy industry, have made a comeback.

Mr Yu, in his new position as China's energy chief, separately met a Japanese delegation which was also received by Mr Zhao. Mr Gu also made more appearances and officiated at the launching of a 27,000-ton bulk carrier that Chinese shipyards built for a Hong Kong shipowners.

The head of the "old" team, commonly acknowledged to be yet another party vice chairman, Mr Li Ziannian, has also been receiving guests and speaking of economic developments of the country.

With the apparent shift back to heavy industry, even ever so slightly, a major question now arises: to what extent will the shift move and what kind of a balance, if at all, is to be struck?

A re-emphasis on heavy industry will mean new investment and China is known to be short of funds these days. While borrowing will be one way to resolve this problem --and China's credit standing in the international market is fairly good--this will only meet part of the capital required for the development.

There is also the problem of what to do with the dozens of heavy industrial plants that ceased operations since the middle of last year. Reviving them will mean injection of additional capital which would not have been necessary had these plants continued to function.

All these will be the main problems to which the present leaders will have to address themselves.

The coming fourth session of the Fifth National People's Congress is therefore all the more important for it will be at that session that Mr Zhao will discuss China's economy in his government work report. In that report, he will also discuss the country's Sixth Five-Year Plan already underway.

Mr Gu, at a meeting with a visitor, disclosed that the country's economic growth was 3 percent this year, very low indeed compared with the past few years. He also expressed the hope that the growth in the next 4 years would proceed at the rate of 4.5 percent a year.

These growth figures are a pragmatic assessment considering the sluggish world economy and compared with low growth rates of other countries. The question is whether these expectations can be translated into reality.

For this to be achieved, there must not be any more drastic changes in the direction of the Chinese economy.

HONG KONG PAPER ON PRC ECONOMIC SEMINAR

HK281320 Hong Kong WEN WEI PO in Chinese 28 Sep 81 p 3

[Dispatch From Beijing: "Experts Hold Economic Seminar, Discuss Development Speed During Readjustment Period"]

[Text] How are we to maintain a fairly high development speed during the readjustment period? Economic experts in Beijing recently held a seminar and deeply probed this question. The participants unanimously noted: During the pervious period, our country promptly adopted retrenchment measures and revised the proportionate relations within our national economy in order to remedy the serious consequences caused by "leftist" mistakes in our guiding economic ideology which almost brought about a collapse of our national economy. The measures and the revision have yielded notable results in the process of readjustment. However, during the process of readjustment, we must not be stifled by financial restrictions. Financial problems cannot be solved under the situation in which there is a production shrinkage. At present, we have a surplus heavy industrial production capacity, an expansion of industrial losses, a decrease in revenue and a greater risk of having deficits. This situation has put a new issue before us which is in need of immediate settlement. This new issue is: During the process of readjusting our industrial structure, the means of production must maintain a fairly high development speed. Only by doing so can we enliven our national economy.

During the 1950's, "one to eight" was the standard ratio between money supply and turnover from retail trade in social commodities. Some people think that this ratio is no longer applicable to the current social and economic conditions in our country, and that it is imperative to make a concrete analysis of money supply. We cannot practice overall deflation and comprehensive tightening of money supply for a long time.

Some people have noted: At present, although manpower, equipment and facilities in our capital construction, metallurgical and machinery units lie idle and are left unused, there is still a demand for them. Therefore, with the application of the principle of multiplication of investment and the application of the concept of opportunity cost, there will be no inflation even if the state makes more investments. Investments should guarantee good economic effects and supplement financial redistribution with bank redistribution. Some other people have noted: There is a great disparity between our production scale and our real production capacity. We should expand our planned investments, form a fine social production circle and have comprehensive control over our social consumption. By doing so we will reduce financial deficits by a big margin.

The seminar also noted: Energy is an important factor that restricts the speed of economic development. In addition to vigorously broadening sources of energy, our more important short-term task is that we must regard the general conservation of energy as a strategic objective. Energy conservation targets should be combined with economic targets and national income. Broadly speaking, energy conservation should include raising energy systems' efficiency and restructuring the utilization of energy resources.

Some people have noted: Energy is not the only breach. The West deems that except for population and energy, the most challenging question of our time is the excessive consumption of nonfuel mineral resources. Our country is rich in nonferrous and rare metals. We should make full use of this superiority and grasp our nonferrous metal industry as a strategic industry.

'WEN WEI PO' ON IMPROVING ENTERPRISE MANAGEMENT

HK211133 Hong Kong WEN WEI PO in Chinese 21 Sep 81 p 3

[Dispatch From Beijing: "Economic Experts Put Forward Many Measures When Discussing Improving the Economic Effect of Enterprises"]

[Text] Recently the Chinese Association of Enterprise Management held discussions on the problems of improving the economic effect of enterprises. Their analysis and discussion of the problems were on the following three aspects:

1. The main manifestations and causes of the poor economic effect of the enterprises at present: owing to the irrational economic management systems and the influence of the "leftist" thinking and, in addition, owing to the serious disturbance of and sabotage by the "gang of four," problems exist in most of the enterprises resulting in a situation where, with only a few exceptions, the economic effect cannot be improved quickly. This is mainly demonstrated in the relative backwardness of the main economic and technical targets in quite a few enterprises, the low efficiency in exploiting energy and labor and the low profit rate compared to international interest rates. The low economic effect of industrial enterprises is due to problems in both the macrostructure and the microstructure of the economy. Its causes are diverse. Within the enterprises, the main causes are overemphasis on technology and neglect of administration, overemphasis of production and neglect of management, overemphasis of fulfillment of plans and neglect of the economic effect.

2. The chief measures for raising the economic effect:

At present the enterprises should proceed from reality, make a relevant study of the experiences in raising the economic effect in a few advanced enterprises in Shanghai, Shandong, Jiangsu and Jiangxi and combine this study with the reality of the respective localities and enterprises. Major measures for raising the economic effect have been put forward in five aspects. Diversified forms of economic responsibility systems should be set up. At present, to consolidate the enterprises and raise their economic effect we should take the establishment of diversified forms of economic responsibility systems as a basis for effecting a breakthrough. To set up economic systems we should correctly engage in two three-in-one combinations: the three-in-one combination of power, responsibility and interest and the three-in-one combination of the interests of the state, the enterprise and the individual. In the former combination the interest is economic impetus, the interest should be based on fulfilling the responsibility, and the power is the guarantee for fulfilling the responsibility. In carrying out the economic responsibility systems, political and ideological work must be intensified. Material and spiritual measures should be coordinated and neither of them can be dispensed with.

Economic accounting should be intensified. In coordination with the economic responsibility system, economic accounting should be intensified and accounting systems should be gradually set up and perfected for a whole factory, for all the personnel and for the whole process of production so as to carry out overall economic accounting. Special emphasis should be put on management. Circulation should be enlivened as should production. Therefore, emphasis should be put on management in order to be able to do more business with the same amount of capital.

Attention should be paid to expanded reproduction by intension in making efforts to raise the efficacy of production. Only by raising the efficacy of production can the existent equipment, labor, the targets of labor and other elements be combined well and be exploited to the greatest extent.

Construction by the leading groups of the enterprises should be intensified. The key to consolidating enterprises and raising the economic effect is for their leading groups to do a good job in construction.

3. A few problems outside the enterprises:

Raising the economic effect of the enterprises mainly depends on tapping their internal potential. However, from outside the enterprises, the state and the departments in charge of them should create certain conditions for the enterprises. The following should be done:

Reinforce the leadership of the enterprises' management.

Sincerely implement all the economic policies which concern the enterprises.

Vigorously train their management cadres.

Hold in a planned way for various enterprises management discussion meetings in groups according to professions and localities.

Set up advisory companies in industrial provinces and municipalities.

CSO: 4006/27

HONG KONG PAPER ON PRC'S ENTERPRISE MANAGEMENT

HK280705 Hong Kong WEN WEI PO in Chinese 25 Sep 81 p 3

[Dispatch From Beijing: "State Council Resolves to Grasp Enterprise Management"]

[Text] After implementing the economic responsibility system in the industrial and communications enterprises, leaders of the state council pointed out that it is necessary to rapidly promote rectification of enterprises and business management and to motivate the enthusiasm of the cadres and workers in tapping the potential of the enterprises. It is necessary to pay particular attention to this question this year as well as in the future.

According to the state council leaders, our industrial and communications enterprises are seriously wasting money. It can be said that gold is found everywhere because the larger plants usually waste more. However, generally speaking, the more the waste, the greater the potential. The present ratio of the growth rate of industry and financial revenue is approximately 1 percent increase of output to 1 billion yuan of financial revenue. If the total industrial output is increased by 4 to 5 percent each year, financial revenue will only be increased by 4 to 5 billion yuan. However, if we really grasp the economic gains of the enterprises, we will get several billion yuan of financial revenue instead of 1 billion. In light of their experiences, the directors of the Financial Bureau of Fushun Municipality said: If each of the 6,000 key enterprises throughout the country saves 1 million yuan in tapping potential, a total of 6 billion yuan will be saved which is equivalent to the financial revenue obtained. A result of a 6 percent increase of the growth rate of industry.

According to the state council leaders, the factors accounting for waste are first, the malpractice of eating out a big pot, and the lack of drive among the enterprises and the workers who are not concerned with the economic gains of the enterprises; second, irrational utilization of raw materials in the localities and departments which are segregated from each other and are always engaging in petty disputes. The objective of pushing forward the economic responsibility system is to make the workers treat the factories as their own and be concerned with the factories, promote production of the factories, tap the potential of various aspects and increase the economic gains. We must affirm this point, or else, we will start on the wrong road in promoting the economic responsibility system.

The state council leaders have pointed out three points regarding how to tap the potential of enterprises: 1) improve the level of business management; 2) promote technological restructuring centering on increasing the economic gains; and 3) rationally utilize the raw materials. All this means asking for money from business management, from tapping potential, renovating and restructuring industry and from comprehensive utilization of raw materials.

According to the state council leaders, relying on these sources of wealth, Fushun Municipality fulfilled the state's financial quotas this year despite decreased production in coal, oil, steel and aluminum, and scored success in ensuring financial revenue despite decreased production. All areas and all departments, in particular, the industrial and communications departments, must grasp a number of enterprises which possess great potentials to implement the economic responsibility system, improve the level of business management, carry out technological restructuring centering on increasing the economic gains, strengthen rational utilization of raw materials and organize joint projects and promote coordination, and so on. In the future, in addition to general scheduled arrangements, we must arrange investment, equipment and raw materials for technological restructuring and provide equipment for relatively large backbone enterprises which enjoy great economic gains.

The state council leaders stressed and pointed out: from now on, leaders of all industrial and transportation departments must fix their eyes on the lower levels and tap the potential and get money from large enterprises. It is necessary to know the ideas of the key enterprises which possess great potential and can really increase economic gains. Arrangements can be made for all projects which can get the best economic results, however, prior to this, the necessary amount of capital and raw materials is subject to approval of the state economic commission and financial department, projects which get the greatest economic gains will be given priority in arrangement; and capital will be allocated to enterprises which require a relatively small amount of investment and which brings about quick results. Planning should also be carried out centering on increasing the economic gains.

TIANJIN MAY BECOME SPECIAL TRADE AREA

HK250208 Hong Kong SOUTH CHINA MORNING POST in English 25 Sep 81 p 1, Business Supplement

[Text] China is planning to turn Tianjin into another special trading area, in a bid to speed up the country's economic development, sources close to Beijing told business news.

Details concerning the application of the principles of special economic zones to Tianjin are being drafted.

Souces said that developments in Tianjin may be similar, although not identical, to Guangzhou, Shenzhen and Zhuhai of Guangdong Province and Shantou of Fujian Province [as published] which are forerunners for China's specially-designed economic policy.

Tianjin is a coastal municipality and the city is one of the three largest cities in China, after Beijing and Shanghai. It has been a traditional trading port, with well-established light and heavy industries.

Meanwhile, at a meeting held recently in Beijing to discuss progress made in SEZ's [Special Economic Zones], Chinese authorities concluded that the policy of dedicating provinces and cities to trade should be widely applied to other Chinese cities.

Sources said that there are plans to designate areas in Tianjin, Shanghai and Beijing as additional special trading areas. "This is also aimed at quickening the pace of China's economic development," an official from Tianjin commented here yesterday.

It was also learned that Xigiang [place name as published] will be further developed as a support base for offshore oil activities in northern Chinese waters.

Direct air links between Tianjin and Hong Kong are being considered and discussions on the subject will be held at the appropriate time.

Tianjin plans to attract foreign investments through Hong Kong--following the examples set by Guangdong and Fujian which have offices here.

Cooperation with foreign investors will include compensation trade, processing and other joint ventures.

China traders in Hong Kong welcomed the idea of more special trading areas.

"Interest has already been shown by foreign companies, especially electronic companies, to extend operations to Tianjin," the assistant director of the Hong Kong General Chamber of Commerce, Miss Cecilia Fund said.

The area manager (China) of the Hong Kong and Shanghai Banking Corporation, Mr Anthony Russell, believes opening more special trade zones is likely to increase foreign investments.

But he suggested that the same set of regulations must govern all special trade zones to avoid confusion.

STERN PUNISHMENT FOR SMUGGLERS IN GUANGZHOU

HK231354 Hong Kong WEN WEI PO in Chinese 22 Sep 81 p 3

[Dispatch From Guangzhou: "Guangzhou Reiterates Stern Punishment for Smugglers and Pedlars of Contraband"]

[Text] The Guangzhou CCP and revolutionary committees this morning reiterated the necessity of imposing stern punishment on units and personnel engaged in the smuggling and peddling of contraband.

At this morning's meeting, which was held to draw up plans to crack down on smuggling activities, it was pointed out by the Guangzhou CCP and revolutionary committees that since they started cracking down on the smuggling and peddling of contraband in April this year, they have already uncovered over 100 cases of smuggling and more than 4,000 cases of peddling contraband. The private goods market has been outlawed and both public order and market order have shown signs of improvement, but they have not yet been able to break the back of such smuggling and peddling activities.

In connection with the present problems, the meeting stressed that all enterprises, institutional units, organs, bodies, schools, troops and individuals, and especially party members, cadres and soldiers are forbidden to smuggle, peddle or buy contraband. They may not, in any way shield, cover up or support the smuggling and peddling of contraband. As for those units engaged in such activities, we must carry out a thorough investigation of the facts and mete out severe punishments.

The meeting announced that stiff sentences should be meted out to heads of smuggling rings, smugglers in general should be punished according to the law, stiff sentences should be meted out to drug traffickers and gold and platinum smugglers, and cadres who harbor smugglers for a share of the spoils should be subjected to the full sanctions of the law. All contraband must be seized and must not be purchased. Contraband seized by antismuggling units should be sold to designated commercial units for a fair price and must not be dealt with independently.

FOREIGN TRADE

BRIEFS

CHINA, ROK TRADE--Hong Kong reexports of China-origin goods to South Korea increased 118 percent of HK$97 million during the first 6 months of this year, the government announced yesterday. This substantiated earlier reports that China has been doing business with South Korea through Hong Kong as the middleman. China earlier this month admitted publicly for the first time in a report carried by GUANGZHOU RIBAO that it conducts trade with South Korea via Hong Kong. China has close links with Communist North Korea and does not recognize the government in Seoul. And Chinese officials had consistently dismissed reports of trade with South Korea. Seoul businessmen estimated that China's trade with their country might reach the HK$1 billion-mark, compared to nearly HK$600 million last year. ECONOMIST SIXTH FIVE-YEAR PLAN

OW110827 Tokyo KYODO in English 0744 GMT 11 Oct 81

[Text] Beijing, 11 Oct (KYODO)--A top Chinese economist has said China is aiming at wiping out its fiscal deficit by the end of next year. This was disclosed by Sun Shangqing, deputy director of the Economics Institute of China's Academy of Social Sciences in an interview Saturday with a group of KYODO News Service reporters here.

The economist said this is one of the three major targets of a sixth 5-year economic plan (1981 to 1985) which the government is preparing to submit to the National People's Congress next month.

The two other main targets of the plan are: keeping the fiscal accumulation rate below 30 percent and the modernization of the industrial structure, he said.

Sun said the basic aim of the sixth plan lies in the continuation of economic readjustment, and that under the plan, 1982 basic construction investments would be held down to 30 billion yuan (about $17.4 billion) to 38 billion yuan (about $22 billion).

China's heavy industries have recorded a plunge so far this year. Efforts will be made next year for the development of the machinery industry and other measures be taken to prevent a further decline in the heavy industries as a whole, the economist said.

The Chinese Government initially forecast a fiscal deficit of about 8 billion yuan (about $4.6 billion) for 1981, according to the economist.

However, thanks to the economic readjustment policy, the deficit is now considered likely to be held down to about 2 billion yuan (some $1.16 billion) as of the end of 1981, Sun projected.

The economist did not give definite production targets under the sixth plan. However, he said the present crude oil production level of 100 million tons a year would be maintained for some time to come.

On coal, Sun said China could not fully work out its potentialities because of the greatly limited transportation capacity.

The economist also said an atomic power plant or plants will be built during the sixth-plan period. He added that feasibility studies on the technological, economic and environmental aspects of the project are now under way.

Sun also said an outline of a long-term economic plan would also be submitted to the National People's Congress next month. The outline will envisage the construction of satellite cities while preventing the expansion of major cities and a raise in the employment rate of the tertiary industry--service industry--to 15 percent from the present 11 percent, he said.

BRIEFS

COPPER EXPLORATION IN ANHUI--Tokyo, 24 Aug (KYODO)--Japan has agreed to extend technological cooperation to China in exploration of copper deposits in Anhui Province, eastern China, it was announced Monday. The Governmental Metal Mining Agency of Japan said it reached the agreement with the Chinese Ministry of Metallurgical Industry. The copper deposits, located about 20 kilometers north of Anqing City, have an estimated 31 million-ton copper ore reserve. The ore has an average 1.34 percent copper content. An agency spokesman said preparations for the detailed exploration would be started next month so that exploration could begin late in the current fiscal year or early next year. The schedule calls for shafts to be sunk in fiscal 1982 and 1983, tunnels to be dug the year after, and borings to be conducted in fiscal 1985. This is estimated to cost yen 2 billion (about $8.7 million), to be jointly borne by the two governments, the spokesman said. [Text] [OW241215 Tokyo KYODO in English 0723 GMT 24 Aug 81]

BRIEFS

BUILDING MATERIALS OUTPUT--Beijing, 7 Oct (XINHUA)--Output of mica, granite, cement poles, cement asbestos shingles and terrazzo have met the annual state quota ahead of time, according to the Ministry of Building Materials Industry. Output of 16 products, including cement, plate glass, glass fibers, hygiene ceramics and glazed bricks, met more than 75 percent of the annual target between January and September. Jiangsu, Zhejiang and nine other provinces and municipalities produced 1.7 million cubic meters of cement structural parts for rural house construction. This can provide housing for 1.3 million families. [Text] [Beijing XINHUA in English 0247 GMT 7 Oct 81]

FOREIGN TRADE

EXCELLENT RESULTS OF COOPERATION WITH FOREIGNERS DISCUSSED

Nanjing XINHUA RIBAO in Chinese 28 Aug 81 p 1

[Article by Yao Guoguang [1202 0948 0342]: "Results of Our Province Using Foreign Capital and in Cooperating With Foreigners Economically Have Been Good"]

[Text] Responsible persons on the Provincial Import-Export Committee told a reporter for this paper that since the 3d Plenum of the 11th Party Central Committee established the policy of opening the economy to the outside world our province has made definite headway in making use of foreign capital and in developing economic and technical cooperation with foreigners.

According to statistics for the last two years worth, our province has adopted practices such as processing and assembly for foreigners, compensatory trade, joint ventures, and administering local short-term foreign currency loans. In all there have been 481 economic cooperation projects successfully negotiated with manufacturers and business firms of Hong Kong, Macao and other foreign countries. These entail the use of US $136 million of foreign capital. The bulk of these projects involve the light, textile and electronics industries where a small investment will bring quick results in a short period of time. Because of this, the state of development has been excellent. Just taking foreign currency loans as an example, of the 347 loans that were approved as of the end of last year, 200 have already been paid off. The foreign currency returned was 75 percent of the actual funds used. After all projects are put into production, they can produce more than US $100 million annually.

In the areas of expanding the production capabilities of existing enterprises, developing new technology, improving product quality, increasing exports and planning for the utilization of labor and employment, the projects which have already gone on line have shown great initiative. For example, the textile profession in our province introduced certain technically advanced equipment and forcefully solved the weak links of needle and fabric production and techniques for handling goods after printing and dyeing is completed. This allowed for a 5-fold increase in the export of woolen materials, an 87.5 percent increase in the export of knitted wool floss shirts, a 52 percent increase in the export of printed cloth, and a doubling of the exports of broad cloth. Embossed calico, schreinerized twill satin, calico yard goods, embossed velvet, clipped-nap towels and other new high class products have appeared in succession. Light industry departments coordinated the reform of old factories, and though the use of foreign capital and the initiation of compensatory trade, achieved the successive introduction of technical equipment for producing bicycles, watches, digital watches, plastic knit, food cans and other things. This has not only improved the production situation, but also has presented the enterprises manufacturing machinery for light industry with materials from which to learn. Certain enterprises in the electronics industry have squarely faced the conditions of backwardness in production methods and substandard quality of parts and have begun foreign parts assembly operations. They have obtained the necessary facilities and testing apparatus, have already solved key production problems, have trained staff, workers and technical troops, and one after another have locally produced radio-recorders, electronic alarm radios, pocket calculators and other such products which have enriched the domestic markets.

Utilizing foreign capital is a new operation which is strongly policy oriented and is very involved, and because of our lack of experience, problems exist both in our practical work and in terms of economic results. From now on, on the foundation of a serious summation of experience and in accordance with the characteristics and needs of the industry and agriculture of our province, we must expand our contacts with firms of Hong Kong, Macao and other foreign countries, strengthen research of what undertakings are possible, further enliven and improve the work of using foreign capital and of economic and technical cooperation with foreigners, and better serve the readjustment of the national economy.

FOREIGN TRADE

EXPORTS OF MECHANICAL, ELECTRICAL ENGINEERING PRODUCTS INCREASE

Kunming YUNNAN RIBAO in Chinese 24 Aug 81 p 1

[Article by Provincial Import and Export Administration Committee: "Exports of Mechanical and Electrical Engineering Products in Our Province Continues To Increase"]

[Text] Thanks to the close coordination of industry and trade and the increased channels for export in the past year, the varieties and quantities of mechanical and electrical engineering products for export have continued to increase in our province. This has helped increase our foreign exchange earnings and has contributed to the success of the national economic readjustment in our province.

The Yunnan Provincial Mechanical and Electrical Engineering Equipment Export Company, formed by the integration of industry and trade, was established in October 1979. The staff of this company consists mainly of engineers and technicians of the machinery departments of the province. Under the principle of unified action toward foreign countries, the export of mechanical and electrical engineering products from our province, hitherto handled by some coastal units as arranged by the foreign trade departments, is now managed by the province itself. Through the combined efforts of the industry and of trade sectors in our province, the volume of our mechanical and electrical engineering products exported in 1980 was 2.6 times that of 1979. The types of these products for export have also increased. Instead of just lathes, telescopes, and a few other items, 25 different types of items, including power transmission lines, cables, battery plates, ballast, and metal switches have found their way into the world market.

There have also been new developments in the export of mechanical and electrical engineering products since the beginning of this year. In the first 6 months, the contracts signed with foreign merchants involved a total of 23 million yuan, more than double the figure for all of 1980. In addition to those items exported to Burma, Thailand, Pakistan, and Bangladesh, totaling more than 2,000 sets last year, the "Jinma [Golden Horse]" brand diesel engines have been sold to the United States this year. The export of various types of ball bearings produced in the province was only some 2,600 sets in 1979. This was increased to 600,000 sets in 1980 and has risen sharply to 1.44 million sets this year. This increase not only has brought in more foreign exchange earnings, but also has kept the four ball-bearing plants in the province operating at basically full capacity.

While expanding the export of mechanical and electrical engineering products, we have also imported advanced technology through the processing of materials supplied by foreign customers according to their designs and diagrams. This advanced technology has helped raise the technical level of machinery processing and has opened a new avenue for the export of our mechanical and electrical engineering products. For example, the Kunming Lathe Plant has cooperated with a Dutch company in producing digital-controlled lathes, and with a company, called Ka Bo, of West Germany in processing engraving rulers. The Yunnan Heavy Machinery Plants, in cooperation with a specialized West German company, has produced a rubber compression machine according to the diagram supplied, with a foreign merchant serving as the sole agent for the products. The Kunming Drilling Machine Plant has cooperated with a French company, called Gan Bai, for the production of all-purpose drilling machines.

The machinery industry in our province already had an established foundation, and there is a potential for the development of small and medium-size mechanical and electrical engineering products for export. Industry and trade, once integrated, can promote each other, and integration can bring into play the strongpoints of each side. There is now a great future in our province for the exporting of mechanical and electrical engineering products.

BRIEFS

DELEGATION TO FRG EXHIBITION--Beijing, 12 Sep (XINHUA)--China will participate in the fourth European international machine tool exhibition to be held in Hanover, West Germany, on 15 September. This was stated by Liang Xunxuan, deputy chief engineer of the general machine tool corporation of the First Ministry of Machine Building, who is leaving for Hanover today at the head of a Chinese trade, technical and production cooperation mission. Liang Xunxian said, "China will strengthen technical inter-change with other countries and try to find better ways for trade cooperation, including co-production." China began to export machine tools in 1957. More than 10,000 machine tools were exported to Japan, France and 50 and more countries last year. China now has 120 large machine tool plants and a greater number of medium and small plants scattered all over the country. Since 1970, China's annual production of machine tools has remained at about 140,000 in 1,400 specifications, 100 of which are precision tools. [OW151335 Beijing XINHUA in English 0821 GMT 12 Sep 81]

IMPORTS, EXPORTS--New progress has been made in China's foreign trade in the first three quarters of this year. Compared with the same period of last year, the total amount of imports and exports has increased by more than 10 percent with exports exceeding imports. According to statistics, the total amount of imports and exports from January to September, was $28.72 billion, of which exports accounted for $14.69 billion and imports $14.03 billion. Compared with the same period last year, the total amount of imports and exports has increased by 11.1 percent, with export increasing by 13.2 percent and import 8.9 percent. BRIEFS

YUNNAN MOTOR TRANSPORT REGULATIONS--The Yunnan Provincial People's Government recently printed and issued the provisional regulations on control over motor transport of goods and demanded that all prefectures, autonomous prefectures, municipalities and counties enforce them. The regulations provide that under the leadership of the provincial traffic leadership group, the Provincial Traffic Department is to be responsible for the control over motor transport of goods. The economic committees, planning committees, traffic departments, industrial and commercial administrative departments and public security departments of all prefectures, autonomous prefectures and municipalities are to organize traffic leadership groups to strengthen administration of local traffic work and transport. Special organs must be established to be responsible for this work. All motor vehicles for civil use throughout the province must be divided into two classes: motor vehicles of a business nature and motor vehicles of a nonbusiness nature. The units and motor vehicles which engage in transport of a business nature must hold business licences issued by the industrial and commercial administrative departments and pay the business tax and business charges to the state. The transport charges must be fixed by the province and cannot be negotiated arbitrarily. [HK051320 Kunming Yunnan Provincial Service in Mandarin 1100 GMT 10 Sep 81]

GENERAL

'FROM EACH ACCORDING TO HIS ABILITY' CONSIDERED NECESSARY

Jinan DAZHONG RIBAO in Chinese 3 Sep 81 p 3

[Article by Lu Xiyue [4151 1585 1878]: "'From Each According To His Ability' Should Be Correctly Understood under the Socialist System"]

[Text] The achievements of our socialist undertakings in the past 32 years have been the result of painstaking efforts of the broad masses, all trying to do their best under the correct leadership of the party. Therefore, in summing up our historical experiences and stressing the need to observe economic laws and to implement the principle "to each according to his work" in various forms effectively, we should at the same time correctly understand the principle "from each according to his ability" under the socialist system.

"From each according to his ability" means that all able-bodied people should exert their utmost efforts in actively promoting the socialist cause. We must be aware that people usually interpret "from each according to his ability" as a principle applicable only in the communist future, and as merely some general principle advocated in ideological and political education under the socialist system. Such an interpretation is wrong.

Predicting the need for "from each according to his ability" in the future society, Marx and Engels, as we understand, referred to the establishment of the system of public ownership of the means of production, "in which, on the one hand, no individual can throw on the shoulders of others his share in productive work, this natural condition of human existence; and in which, on the other hand, productive work will become the instrument emancipating men instead of the instrument enslaving them, offering each individual the opportunity to develop all his faculties, physical and mental, in all directions and exercise them to the full, and in which, therefore, productive work will become a delight instead of a blight." (ANTI-DUHRING p 290) Under the socialist system in our country, the productive forces have not yet reached the level required for the communist system of the future, and the socialist public ownership of the means of production still takes two different forms. Furthermore, there are remnants of differences between the city and the countryside, between workers and peasants and between mental and physical labor from the old society. Therefore, "from each according to his labor" is still to a certain extent restricted by social economic conditions. However, it must not be forgotten that we have already established and developed the socialist system of public ownership of the means of production. Regardless of the form of public ownership, the laborers have become the owners of the means of production. From this, we can conclude that the nature of labor, thus defined, "is no longer the kind of labor serving the wealthy people and the exploiters, but the labor serving the laborers themselves and the society." ("Collected Works of Stalin," Vol 13, p 223) If the enthusiasm of laborers has been suppressed, their wisdom stifled, and their talents restricted under the system of exploitation for hundreds or thousands of years, now we can say that the establishment of the socialist system has given the laborers an equal opportunity of contributing "from each according to his ability" to the task of ushering in a new historical era. Instead of the instrument of enslaving people, labor has become the instrument for people to emancipate themselves. Therefore, "from each according to his ability," like "to each according to his work," is a principle independent of people's will, wish or demand; it implies an objective inevitability in the process of socialist economy. The task for ideological education is precisely to discover, affirm and protect, and then to develop and realize this inevitability. Every member of the society should correctly understand his own social position as a master, display his vigor, and try his very best in continuing to blaze a trail of happiness for himself and the society. In short, happiness cannot drop from the sky; it can only be created with people's hands. For the same reason, the noble cause of socialism can only be served with the dogged determination of millions upon millions of people.

We should also clearly understand that more social products to be distributed according to the principle "to each according to his work" can only come from the hard work of people doing their very best.

"Men reap what they sow," so goes a common saying. We must sow more before we can reap more, and reap more before we can distribute more. If we want to sow more, reap more and distribute more, people should work to the best of their ability and the land should be used to the best advantage. For the same reason, the total amount of social products for the society to provide "to each according to his work" depends, in the final analysis, on the laborers' efforts to continually raise labor productivity by doing his very best. When the laborers' ability is given full play and fully utilized, labor productivity will continue to rise, and the same amount of labor, say 8 hours per day, will produce more social products for distribution according to people's work. For each laborer, the same amount of labor will bring a bigger return according to the principle "to each according to his work." This holds true for workers of enterprises owned by the whole people as well as those owned by the collectives, and to those of communes and production brigades.

Some comrades have turned the dialectical relationship between production and distribution upside down and severed the relations between "from each according to his ability" and "to each according to his work" by advocating the so-called "working according to the remunerations offered" principle. This means viewing the socialist principle of distribution from the mercenary standpoint of the exploiting system. If we let this decadent concept interfere with people's thinking and influence their action, it will certainly turn out to be what Lenin criticized as "the narrow horizon which compels one to calculate with the coldheartedness of a Shylock whether one has worked half an hour more than somebody else, whether one is not getting less pay than somebody else." ("Selected Works of Lenin," Vol 3, p 254) Under such conditions, there cannot be any higher socialist labor productivity to speak of, and neither the total amount of social products nor the shares of individual laborers distributed "to each according to his work" can be increased. That is why when we speak of "to each according to his work," we must think of "from each according to his ability."

Every laborer should work for the socialist cause to the best of his ability. However, it must also be borne in mind that at the present socialist stage, the progress of economic activities and the development of various related undertakings of either the economy of ownership by the whole people or that of ownership by the collectives can only be realized under certain leadership or in certain organizational forms. Therefore, it is the duty of the leadership at each level to assign laborers to suitable posts according to the requirements of the social economy and the intellectual and physical power of each laborer. This applies to every production team, every plant and even the whole state. Since the Third Plenary Session of the 11th Party Central Committee, both the party and the government have advocated the correct principle of increasing job opportunities, implemented the policies on intellectuals, vigorously developed various educational undertakings, and rewarded and respected those who have achieved success in various fields. All these measures are essentially intended as an encouragement to the laborer to do their very best. We must not lose sight of the fact that in some localities, departments or units, the leaders have still failed to realize the importance of training people and putting them to proper use. They also closed their eyes to misplacement of professional workers and even considered talents as a matter of the "system of ownership by units." Even in handling problems of employment for which the policy has already been spelled out, they will withold action as soon as any difficulty is encountered, or may simply cast these problems aside as though they are an extra burden; this and so forth. After all, they lack a correct understanding of the rights enjoyed by laborers according to the principle "from each according to his ability" under the socialist system. This situation must be corrected. We must rely on the creative labor of all people according to the principle "from each according to his ability" in order to build our country into a strong modern socialist country.

PROGRESS SEEN IN FINANCE-TRADE WORK

Kunming YUNNAN RIBAO in Chinese 26 Aug 81 p 1

[Article: "Our Province Has Made New Progress in Finance and Trade Work in the First Half of the Year--Thoroughly Adjust Principles, Promote Development of Production, Expand the Marketing of Goods"]

[Text] In the first half of this year progress was made in the finance and trade work of our province. The main planned targets in each area were increased in varying degrees over the same period last year.

So far this year trade and finance departments in our province has thoroughly and seriously adjusted principles, continued to do well in the reform of every item which is beneficial to the adjustment, actively supported the production of goods, firmly grasped the management of the sources of supply both inside and outside of the province, and at the same time strengthened the management of the markets, protected appropriate trade and attacked various illegal activities, with the result of enlivening the market and promoting a further flourishing of the economy. The major developments have been:

A boom in buying and selling in the market. In the first half of this year net purchases of goods from state run enterprises and supply and marketing cooperatives were up 11.7 percent over the same period last year. Among these, purchases of farm sideline products increased 6.6 percent and purchases of local industrial products increased 12.1 percent. The purchases of certain important farm sideline products such as rapeseed, hogs, tea leaves, edible sugar and also hemp seed, wild sources of oil, palm, ginger, sunflower seeds, pumpkin seeds, dried bamboo shoots, peppers and others of the 3 types of farm sideline products were all up over the same period last year.

Along with the development of production, purchases have increased and the supply of goods has improved. In the first half of this year, the value of retail sales increased 6.5 percent compared to the same period last year. Of this, the value of the retail sales of rural consumer goods increased 9.4 percent. This was proportionately greater than the increase in the value of retail sales of urban consumer goods. The volume of sales for most goods increased, in varying degrees, when compared to the same period last year. The collective and individual commercial enterprises and the food service industries of the entire province continued to develop, and this promoted the development of a commercial goods economy. In the first half of this year, the value of retail sales of collective commercial enterprises and food service industries increased 20 and 28.9 percent respectively over the same period last year.

Urban and rural periodic market trade has been more lively. To the end of June, the number of trade stores in the periodic markets of the entire province had already reached 2,190. This is an increase of 52 since the beginning of the year. And for the first half of the year the value of sales of goods in periodic markets increased 30.7 percent compared to the same period last year. The general level of prices of the goods in the periodic markets decreased 9 percent compared to the same period last year, and the difference between these prices and the official prices was reduced. Under the guidance of the state plan, market regulation was further developed. In this regard, the total value of the farm subsidiary products purchased in the supply and marketing cooperative system of the entire province during the first half of the year increased 18.7 percent compared to the same period last year, the grain negotiated for within the grain network of the entire province from April to June increased 7 times compared to the same period last year, and there were advances in trade warehouse operations everywhere.

Fiscal income increased, expenditures fell. In the first half of this year the fiscal income of the entire province fulfilled 55.5 percent of the annual plan. Of this, revenues from industrial and commercial taxes clearly increased. Fiscal expenditures were 18.9 percent less than in the same period last year. Planned reductions such as expenditures for capital construction, administrative management costs, social and collective procurements of goods and others were less than for the same period last year. Certain expenditures related to the lives of the masses such as culture, education and sanitation, city maintenance, housing for municipal employees, survivor relief, etc. increased to differing extents over the same period last year.

There has been an increase in currency withdrawn from circulation, and the amount of currency circulating in the marketplace has decreased since the start of the year. Prices have basically stabilized. In the first half of this year, in a situation where the supply of currency to the marketplace had increased and the purchasing power of the people in rural and urban areas was clearly higher, because of the active management of the supply of goods by the trade and finance departments at every level, service income expanded, urban and rural savings increased and currency in the market changed from last year's net investment to a net withdrawal this year, with 50 million yuan more withdrawn this year than last. Up to the end of June the amount of currency circulating in the markets throughout the province had decreased 6.7 percent compared to the end of last year. Because of the increase in the supply of goods, increases in the currency withdrawn from circulation, increases in fiscal income, and because at the same time certain subsidies were provided for products whose purchase and sales prices were inverted, for the first half of the year prices in our province stabilized and the people's lives were peaceful.

IMPORTANCE OF ECONOMIC RESPONSIBILITY SYSTEMS DISCUSSED

Jinan DAZHONG RIBAO in Chinese 1 Sep 81 p 1

[Article by Wang Yuzhang and Jiang Shiling [3769 5940 4545, 1203 0013 1694]: "Grasp the 'Bull By the Horns' in Developing Commune and Brigade Enterprises--A Discussion of the Implementation of System of Economic Responsibility in the Commune and Brigade Enterprises of Our Province"]

[Text] Systems of economic responsibility for the commune and brigade enterprises of our province have already been promoted everywhere within the bounds of our entire province. According to incomplete statistics, at present approximately 70 to 80 percent of the total commune and brigade enterprises of the entire province have implemented systems of economic responsibility. In the process of carrying out these systems, most have been careful to work from their own actual situations and to combine economic responsibility, economic effectiveness and economic benefits in a way suited to their situations. The primary forms employed are these 7: piecework wages, small collective piecework, piecework in excess of targets, specialized contract work, profits based on completion of contracted work, floating wages, and a workpoint bonus system. Practice has proven that in carrying out systems of economic responsibility, if we can do reasonably well in combining rights, responsibilities and benefits and do a good job balancing the benefits for the state, the collective and the individual, then commune and brigade enterprises will develop quickly.

Although the communes and brigades of our province have not carried out systems of economic responsibility for a long period of time and these systems are still not perfect, their usefulness and effectiveness have already begun to show. This is mainly displayed in 4 areas: The first is in mobilizing the initiative of enterprises and employees. Labor productivity has greatly increased. Seventy-four percent of the commune-run enterprises in Jiao County have implemented some form of economic responsibility system and the initiative of the employees has greatly increased. In the first half of this year the value of production and profits increased 17.9 and 15.7 percent respectively over the same period last year. Labor productivity for all personnel increased 11.2 percent compared to the same period last year. The second is in the promotion of the reorganization of commune and brigade enterprises and in the improvement of management. In all cases, units which have done well in promoting the economic system of responsibility have all begun by carrying out a reorganization of the enterprise and a strengthening of its management. They have established economic standards and targets for each item of work, forcefully grasped product quality and economic accounting and so brought about greater economic benefits for the enterprise. Ninety-four percent of the commune and brigade enterprises in Yentai Prefecture have implemented systems of economic responsibility. In the first half of this year, under conditions of rising raw material and fuel prices, the enterprises actively undertook to improve management, promote overall economic accounting and reduce production costs, and this caused actual profits of the commune run industries of the entire prefecture to increase by 12.4 percent over the same period last year. The third is in carrying out the principle of distribution according to work, more work bringing a greater share, and balancing the benefits of the state, the collective and the individual. After its commune and brigade enterprises implemented systems of economic responsibility last year, the Sunjiatuan Commune in Weihai paid 26.92 percent more taxes to the state than the previous year, while public reserves increased 58.6 percent and the income of individual commune members increased an average of 174 yuan. There was also a rather large rate of increase in the first half of this year as compared with the same period last year. The amount of taxes paid to the state increased 1.8 times, collective reserves increased 1.5 times, and individual income increased an average of 20 yuan. The fourth is in expanding employee morale, completely renovating the faces of enterprises. The masses have generally indicated that, in commune and brigade enterprises where a system of economic responsibility has been implemented, just as in agricultural work, "we unite in production as we unite in our hearts, everyone is united and everyone is concerned," and "when responsibility falls to the group, everyone is a cadre; when responsibility falls to the individual, all are masters". In the past at the kiln works at Baicheng Commune in Gaomi County when it would rain during the night the cadres would cry their lungs out in vain trying to get people to come and cover the unfired bricks. Now whenever it rains during the night, not only will those who live at the works arise on their own to cover things up, even some of those who had returned to the dormitories will hurry back to help. In the past, in their treatment of production tools, not just a few workers would "fight for them when on the job and carelessly toss them side when the day was done." Now, with the implementation of a production cost contract system, workers in the plant are extremely careful of even the smallest piece of wood, and this promotes increased income and reduction of expenses. Every area has a large number of vivid facts which make it clear that the promotion of systems of economic responsibility by communes and brigades, in the manner of taking the bull by the horns, increased the workers' sense of responsibility, clears up the confused condition of enterprise management and promotes the development of production.

How can we go a step further in implementing systems of economic responsibility in our commune and brigade enterprises? In terms of the experiences of each area, there are 5 areas of work in which we must do well: (1) Do well in seriously establishing the various targets. Targets are the foundation for success in any system of economic responsibility. They must be positive and reliable, neither easily surpassed nor too difficult to reach. How can we make them positive and reliable, progressive and reasonable? They must be based on a composite balance of the present production levels of the particular enterprise and the highest historical levels, as well as on the levels of those most advanced in the field and the promulgated standards of the departments concerned. When establishing targets, we must fully carry out mass discussion. In regard to crucial targets which are controversial, we must, when necessary, organize and carry out tests in order to gather reliable data. And in our work we should not lightly change targets which have already been established. (2) In signing contracts and requesting credit, we must maintain credibility with the people. Much of the content of the systems of economic responsibility should be confirmed in the form of written contracts. Relations between the commune and the enterprise, between the enterprise and the technical personnel and the operational divisions within the enterprise, and between the operational divisions themselves and the work groups and the individuals that comprise them should all be drawn in one form or another of a written contract or agreement after carrying out mass discussion. After a contract has been formally signed, there must be mutual supervision and common adherence to it. And, in the absence of special circumstances, neither party can be allowed to make unilateral changes. This will give the contract the force of law and it will be protected by national law. (3) Establish strict systems of inspection of goods before accepting delivery and of review. Once technical targets have been reviewed and put into effect for operational units, groups and individuals, we must have precise records, statistics and tables which are accurate, timely and scrupulously well kept. The enterprise must help the operational units and technical personnel select good statisticians and accountants and must maintain the stability of their work. (4) Further strengthen ideological and political work. After a system of economic responsibility is put in place, the enterprise will meet with some new situations and problems. For example, it is easy for a "money grubbing" mentality to spread among a small number of cadres and the masses who will haggle when establishing targets and will even go so far as to engage in pretense and falsehood, to disregard quality, etc. To solve these problems we cannot rely soley on administrative orders and economic measures, but must also do very detailed ideological and political work, frequently commending advances and criticizing bad tendencies, inducing everyone to consciously contribute to the four modernizations. (5) Strengthen leadership. The leading cadres at every level in commune and brigade enterprises must study management, occupational tasks, and technology, and gradually take the initiative in leadership work. At present, the ideological understanding of some of the leading cadres in commune and brigade enterprises are unsuited to the economic responsibility systems being adopted. Some are used to old methods and are stuck in rigid routines. Some have not yet eliminated "leftist" influences and hold a negative attitude toward systems of economic responsibility. This calls for the concerned departments at every level in commune and brigade enterprises to help these cadres correct their understanding, to give them good technical training and to improve the standard of their work and leadership abilities. Within the enterprise leading cadres must carry out a system of job responsibility, distribute workload responsibilities to the operational units and the groups within them and must pay attention to summarizing and publicizing model experiences and solve problems that are discovered in a timely fashion, seeing to it that the economic systems of responsibility develop along with the commune and brigade enterprises and that they continue to improve.

HEALTHY MENTAL ATTITUDE SAID KEY TO SUCCESSFUL READJUSTMENT

Jinan DAZHONG RIBAO in Chinese 6 Sep 81 pp 1, 3

[Commentator's article: "The Key Lies in a Healthy Mental Attitude"]

[Text] This is already the month of September, and we are only a little more than 110 days away from the yearend. The comrades on the industrial front should start to urgently mobilize, pluck up their courage, and make an all-out effort to ensure increased output and income without any loss of time in order to fulfill this year's industrial production plan. This is of very great significance in readjusting and developing the national economy, achieving financial and credit balances, and stabilizing commodity prices.

Since the beginning of this year, industrial production in our province [Shandong] has generally been good. The policy of readjustment is gradually being implemented, and new changes are beginning to take place in the internal structure of industry, the product mix, and the organizational patterns. Despite shortages of energy and raw materials, industry in the province has still been able to maintain its growth, and light and textile industries in particular have increased their output by a fairly wide margin. From January to August, their rate of growth exceeded that of the same period last year by 16.07 percent, and their ratio to heavy industry has increased markedly. The quality of industrial products has also been further improved. However, many problems still remain, and the task confronting us is very arduous, mainly because of the serious decline in heavy industry. In the first 8 months of this year, total industrial output in the province exceeded that of the same period last year by only 2.68 percent, which falls short of production plans. Furthermore, because of poor management, some enterprises' profits were reduced and their production costs increased, resulting in heavier losses. The economic results have left much to be desired. There are many causes for these problems, but one of the main causes is the lack of a healthy mental attitude among some leading comrades, as shown by "disunity, low morale, and lack of energy." This situation must be drastically changed.

The low spirit of some leading comrades is prominently manifested by the lack of a correct understanding of the readjustment policy. They pay no attention to the growth rate, and they even have the mistaken idea that during the readjustment, "the less production tasks they receive, the better it will be; the slower the growth rate, the easier it will be"; and "increased output does not necessarily signify honor, and decreased input makes no difference." Thus, consciously or unconsciously, their leadership over production has slackened, and no attempt is made to fulfill production targets, even though they are able to do so, or are capable of doing so provided they exert a little effort. Their attitude is erroneous. For a long time we suffered a great deal because of our failure to follow objective economic laws, and in economic construction we worked out impractical plans which resulted in serious imbalances. It is now entirely correct to eliminate these "leftist" ideas and to firmly uphold the policy of readjustment. But this does not mean that a growth rate can be dispensed with, much less discarded. The growth rate we want is a steady rate, meaning the production of easily marketable goods of greater variety and higher quality and with lower consumption of energy and raw materials. This kind of growth rate stresses economic results. In so doing, we have to rely on science, technology, our efforts, and revolutionary fervor. Lax leadership and a lack of fervor in work are always undesirable. Practice over the past 2 years has proved that the industrial readjustment this time is different from that of the 1960's, because this time we cannot be without a growth rate. This growth rate cannot be too high, but it cannot be too low, either; otherwise, there will be an economic recession. It will then be impossible for us to keep a reserve of our resources, without which we cannot cope with either present or future problems. As the situation now stands in our province, the profit tax paid by state-run industrial enterprises amounts to more than 65 percent of the total provincial revenue, and every 100 yuan of industrial value yields a profit tax of 19 yuan. If there cannot be a certain industrial growth rate, our revenue will be greatly reduced and our political stability and unity will be adversely affected. That is why we must correctly handle the relationship between readjustment and production. We must attend to readjustment and production simultaneously, and resolutely boost our industrial production in the 4 remaining months of this year. Those trades and enterprises that have adequate production tasks and are capable of completing their production plans, particularly the light textile industrial enterprises, should continue their efforts, operate at full speed, and adopt effective measures to produce more consumer goods which are in demand in the market, as well as to overfulfill the production plan by a wider margin. In those localities or units where production is poor, especially the coal mines controlled directly by the central government, the production decline should be quickly stopped and every effort must be made to tap potential and produce more coal in order to make up the deficit and to fulfill the annual production plan. The metallurgical, chemical industrial, and industrial machinery departments should further readjust their orientation of service and their product mix. Under the guidance of state planning, they should make good use of the supplementary regulative role of the market. They should orient their work to the needs of the market, increase the channels of sales, look for more production tasks, and strive to reduce or wipe out losses. This is an arduous as well as a glorious economic task.

Another manifestation of the low spirit of some leading comrades is their inability to face difficulties. Whenever the need to increase output is mentioned, they think of various difficulties, become full of worry, and lose their confidence. It must be admitted that in industrial production, there are now many difficulties to be encountered, such as shortages of energy, particularly coal and oil, and of raw materials. Many plants have suspended operation while waiting for raw materials. In heavy industry, particularly the machinery industry, some plants have had little or no production tasks at all. All these are objective facts, but the question is what kind of mental attitude should be adopted in the face of these difficulties. Even in the same trade and with the same difficulties, how can some enterprises operate at full capacity and increase their output by a wide margin, while others are operating seriously under capacity with greatly reduced output? Mental attitude is the decisive factor. With strong dedication to and a keen sense of responsibility for the revolutionary cause, they do not retreat in the face of difficulties or evade contradictions, and they are able to devise ways and means of overcoming difficulties and of escaping predicaments. The experiences of the machinery industry in the province have clearly shown that although the production tasks given to many units were very much below their productive capacity, some of these units have actively readjusted their orientation of production according to market demands, have "looked for rice to cook meals" and have become "overfed" instead of "underfed." These units have increased their production, lowered their production costs, and made greater profits. On the other hand, other units could not take difficulties in stride and had to beat a hasty retreat, with the result that workers were left idle and management became disorganized, or, worse still, the whole unit seemed to be in a state of "hibernation." Historical experiences have shown that the more serious the difficulties confronting us, the greater should be our efforts to look for favorable conditions to strengthen our confidence and our courage in order to overcome these difficulties. At present, there are many favorable conditions to be found in our industrial production: Implementation of the spirit of the Sixth Plenary Session has further unified the views of the broad masses of cadres, workers, and staff members, and the party's firm determination to improve economic work has become more obvious; the different forms of responsibility system adopted by more than 90 percent of the plants and enterprises throughout the province have greatly aroused the enthusiasm of the enterprises and workers; the readjustment of the industrial structure and the reorganization and integration of the enterprises have provided good experiences and methods for improving economic results; after a good summer harvest in agriculture, a good autumn harvest is now in the offing, and these harvests have provided or will provide more raw materials and a bigger market for the light and textile industries. As long as we continue to conscientiously implement the whole set of principles and policies from the Third Plenary Session of the 11th Party Central Committee, pluck up our courage, strengthen our leadership, truthfully explain to the workers and staff members the overall situation and the conditions, favorable as well as unfavorable, for the fulfillment of the production plans in their own units, and then encourage them to try to do their best, they can certainly triumph over difficulties and promote this year's industrial production.

Some leading comrades have a poor mental attitude, as manifested time and again by their weak ideological and political work. These comrades have learned from the experiences of the 10 years of turmoil in a negative way, discarded the fine party tradition of criticism and self-criticism, and lacked the courage to criticize and resist unhealthy tendencies in a forthright manner. As a result, there is no clear demarcation between right and wrong or between merits and shortcomings. This practice has seriously dampened the enthusiasm of the workers and staff members. It is our considered opinion that during the successive political movements of the past, and particularly during the "Great Cultural Revolution," the exaggeration of mistakes, the indiscriminate repudiations and attacks, and the excesses of the struggle did hurt a lot of comrades, and such experiences must not be repeated. However, we should still encourage healthy and correct criticism and self-criticism, which is one of the fine traditions of our party. If we do not carry out criticism and self-criticism, but let erroneous ideas and deeds spread unchecked, we will not be able to increase our production, and the cause of socialism cannot be advanced. At present, a small number of workers and staff members in some plants, mines, and enterprises are making erroneous statements everywhere and practicing bourgeois liberalization, in disregard of the four basic principles. Others are keen on fictionalism and anarchism, and are fighting among themselves for no cause. Still others are refusing to observe labor discipline, as shown by their frequent absenteeism. There are also those with serious individualism who use fraudulent means to benefit themselves at the expense of the public, and so forth. Can we still hesitate to criticize and educate these people? Experiences in many plants and enterprises have shown that if these bad tendencies are allowed to spread unchecked, our work will be even more difficult, but that as long as we have the courage to exercise control, the situation will improve rapidly. The Jinan Match Plant has always been fairly well supplied with production tasks and raw materials. Because of lax discipline, however, production failed to improve. Last April, along with the practice of a responsibility system, this plant streamlined its labor discipline, strengthened its management, severely punished two workers who had physically attacked others in violation of discipline, and commended and rewarded those who had dared to combat unhealthy tendencies. These measures produced profound results in promoting healthy tendencies, checking bad tendencies, and stimulating production. In the first 7 months of this year, its output of matches exceeded that of the same period last year by 30 percent, and its profits more than trebled. Every one of our comrades should carefully reflect on this question: Have I been strong or weak in dealing with erroneous statements and bad tendencies that are in violation of the four basic principles? If there are problems, we should quickly solve them. We should proceed from the party's interests and consciously take up the weapon of criticism and self-criticism to unequivocally commend good people and good deeds, strongly criticize erroneous statements, and bravely attack bad people and bad deeds. Only in this way can we really arouse the enthusiasm of the broad masses of workers and staff members.

Still another manifestation of the low spirit of some leading comrades is the laxity of their workstyle, the general calls they are fond of issuing, and their lack of sustained efforts. They usually sit in their offices, and instead of conducting direct investigations at the frontline of production, they busy themselves with reading reports. They have only a fragmentary or superficial knowledge of the situation and rarely analyze or study problems. Their efforts are spent mostly in organizing meetings, but rarely in implementing any special policies. All these are bad tendencies. Many comrades have learned from their experiences the truth of the saying that in carrying out economic construction, people need a "clear head" and, more important still, an "active body." The so-called "clear head" means an emancipated mind which enables people to break down old conventions, disregard outdated experiences and methods, and use their head in pondering over problems according to the plans, policies, and principles already laid down by the Central Committee. The so-called "active body" means going deep into realities frequently so as to become acquainted with new situations and to solve new problems. Some problems should be discovered and solved right on the spot, without wrangling or delay. We must note that in industrial production, there are now many new problems, such as how to determine a rational profit base and the ratio of profits to be retained in the practice of an economic responsibility system; how to correctly handle the relationships between the state, the enterprises, and the workers in the distribution of profits, plus the relationships between new and old workers, front and rear areas, and different types of work; how to carry out the system of economy responsibility in combination with ideological and political work; and so forth. All these problems should be thoroughly investigated and studied and their experiences summed up, so that they can be promptly solved. There should be a radical change in the workstyle of our leading comrades, so that every measure to increase production and income can produce real results.

We cannot afford to lose any time, because opportunity does not knock twice. We must have a clear knowledge of the current situation and of our own responsibility. With the spirit of the Sixth Plenary Session as our ideological inspiration, let us exert the efforts required for climbing Mount Taishan, and seize every minute and second in improving our work and in contributing to the fulfillment of the industrial production plan this year.

ECONOMIC-IDEOLOGICAL-POLITICAL WORK STRESSED IN SHAANXI

Xian SHAANXI RIBAO in Chinese 22 Aug 81 p 1

[Article by correspondents Wu Jingmin [0702 7234 2404] and Wang Hongge [3769 3163 7041]: "Standing Committee of Provincial People's Congress Ends; Chairman Ma Wenrui [7456 2429 3843] Presided and Spoke on Necessity To Change Weak and Lax Leadership and To Improve Economic, Ideological, and Political Work"]

[Text] The 10th Session of the Standing Committee of the Fifth Provincial People's Congress ended on 20 August. Ma Wenrui, chairman of the standing committee, spoke at the meeting and strongly pointed out that in the second half of this year it is particularly necessary to pay attention to economic, ideological, and political work in order to promote material production and socialist spiritual civilization.

At the meeting, the committee members conscientiously studied the speeches of Central Committee comrades and the related documents, freely discussed their experiences in studying the "Resolution," and seriously deliberated on economic work in the province. They also listened to and discussed Vice Governor Hui Shigong's [1920 0013 1872] "Report on the National Economic Readjustment Carried Out in Shaanxi Province Since the Beginning of this Year"; listened to and discussed Vice Governor Jiang Yi's [1203 0001] "Report on the Implementation of the 1981 Financial Budget of Shaanxi province During the Past 7 Months"; and discussed and approved certain personnel changes.

Chairman Ma Wenrui presided over the meeting, and before its closing he spoke on economic, ideological, and political work. He said: Economic readjustment in our province has shown initial success, and the general trend of economic development is good. However, there are still many difficulties and problems, and painstaking efforts are required [if we are] to fulfill or overfulfill this year's national economic plan. We must have firm confidence in carrying out our measures so as to ensure a practical growth rate during the readjustment.

Comrade Ma Wenrui pointed out: The urgent task of the moment is to work hard in the few remaining months of the year in order to fulfill or overfulfill this year's national economic plan. While striving for a good agricultural harvest for the whole year, we should pay particular attention to the fulfillment of our industrial production plan. Therefore, we must stress the following points: 1) Provide more active guidance. One of the fatal weaknesses in our economic leadership at present is the lack of thoroughness in work and the absence of specific guidance. Leading departments and leading cadres at all levels should set up a responsibility system so that there will be a distinct division of work and responsibility. Leading cadres at all levels should frequently visit grassroots units and help the basic-level comrades solve problems. There should be a combination of general calls and specific guidance, because it is impractical to issue general calls without providing specific guidance. Poor work performance should be criticized, and losses resulting from a bureaucratic style should be charged to the responsible persons. 2) Strengthen ideological and political work as their foremost concern. At present, we should study the "Resolution" thoroughly. This study will help us unify our views, strengthen our unity, and pluck up our courage. 3) Popularize the economic responsibility system in a planned way. 4) Resolutely practice the principle "to each according to his ability," and overcome egalitarianism and "eating out of the same pot" in distribution. 5) Strengthen the building of leading bodies. In consolidating the enterprises, their leading bodies should first be streamlined. People of the "three types" should be removed from leading bodies; those taking advantage of their official position for private gain should be demoted; and those who are incompetent should be given other, suitable jobs as soon as possible. On the other hand, those young cadres who have a good political background, who enjoy high prestige among the masses, and who are technologically proficient should be promoted to leading posts, so that the leading bodies of enterprises will be full of vitality and militancy and will be able to lead the workers and staff members in the fulfillment of production plans.

Speaking of problems on the ideological front, Comrade Ma Wenrui pointed out: There has been a certain improvement in our ideological and political work since last year. However, we are still weak in this work, because it has not been taken seriously by some leaders. Some of these leaders have gone from one extreme to another--from the "omnipotence of political education" to the "omnipotence of material incentives." They have to rely on personal gains as a means to get any work done, and thus lead people to "look for money only." Criticism cannot make any headway in political life. Some people consider criticism as the use of the big stick, forgetting that criticism and self-criticism are in line with the fine tradition of our party and can serve as an impetus to the improvement of our work. This is in fact a tendency to evade party leadership and to depart from the socialist road. Some people have even made bold statements opposing the four basic principles and yearning for bourgeois liberalization. Our leadership on the ideological front has been weak mainly because of the pernicious influence of the 10 years of catastrophe. At the same time, the corrosion of bourgeois ideas and lifestyle has also something to do with it.

Comrade Ma Wenrui declared emphatically: It is imperative that the weakness and laxity of our leadership on the ideological front be corrected. The social ideological trend of departing from the socialist road, evading party leadership, and advocating bourgeois liberalization, like the erroneous "leftist" ideas, should be strongly criticized and correctly combatted. We cannot invariably oppose criticism as "using the big stick" or attacking people. Such opposition will lead to the elimination of criticism entirely. We can never lay down our weapon of criticism in our political life. Of course, criticism and self-criticism should be carried out in the proper way. We must seek truth from facts, lay down the facts, and reason things out. Criticism should be well-intentioned. We cannot criticize or attack people indiscriminately with crude and oversimplified methods, and no campaigns must be launched. Dealing with the remnants of the Lin Biao-Jiang Qing counterrevolutionary cliques who are still carrying out subversive activities, with hostile elements who are antagonistic to socialism, and with those who hate to see the country at peace is a different matter. These people must be resolutely exposed and attacked, and the fallacy they spread must be repudiated so that its pernicious influence can be wiped out.

In conclusion, Comrade Ma Wenrui stated: We should carefully study the "Resolution" of the Sixth Plenary Session of the 11th Party Central Committee, come to a unanimity of views, strengthen our unity, and pluck up our courage in order to implement our work and our production well.

Standing committee members of the Provincial People's Congress, including vice chairmen Chang Lifu [1603 7812 1133], Yang Wenhai [2799 2429 3189], Zhang Yichen [1728 3015 1820], Lin Yinru [2651 5419 1172], Hou Zonglian [0186 1350 3425], Yuan Chengting [0626 2398 1656], Shi Feng [4258 6912], Wang Jie [3769 2639], Xiong Yingdong [3574 2019 2767], and Liu Lizhen [0491 0500 6197], attended the meeting. Hang Shangzeng [2635 1424 1073], vice president of the provincial people's higher court; Yang Cunfu [2799 1317 1381], chief procurator of the provincial people's procuratorate; comrades of various relevant provincial commissions and bureaus; responsible comrades of standing committees of various county and municipal (district) people's congresses; and some standing committee members of the provincial chapter of the CCP Central Committee in Xian were also present.

GENERAL

PROBLEMS IN SYSTEM OF RESPONSIBILITY FOR PROFITS, LOSS

Jinan DAZHONG RIBAO in Chinese 5 Sep 81 p 2

[Article by correspondent Liu Tianjiang [0491 1131 3068]: "Attention Should Be Paid to the Solution of Problems in the System of Responsibility for Profits and Losses"]

[Text] The system of responsibility for profits and losses has been practiced by state-run enterprises in Heze Prefecture for one and a half years. From 1977 to 1979, the average annual loss in this prefecture was 14.5 million yuan. With the introduction of the system of responsibility for profits and losses in 1980, losses were turned into profits netting more than 17 million yuan. This year, this prefecture has assumed responsibility for a profit of 10.68 million yuan, and from January to June, leaving out the items for which no objective comparison is possible, it made a profit of only some 3.92 million yuan, which is 50.9 percent below that of the same period last year. After an analysis, it was found that such losses were not necessarily the result of the system of responsibility for profits and losses. Aside from such factors as insufficient production tasks, increased prices of raw materials, and lower prices for products, the decline in profits was caused mainly by the contradiction between subjective wishes and objective facts. The economic results were affected particularly by a lack of understanding of the new situations and new problems connected with the adoption of the system of responsibility for profits and losses, a lack of experience, and improper handling of these new situations and problems.

How can this system be progressive, rational, and continually improved and perfected? Based on the experiences of Heze Prefecture, the following four points deserve our attention and study.

1. The need for good basic work. In the system of responsibility for profits and losses, the base profit, either progressive and rational or otherwise, has a direct bearing on economic policies and economic results. The levels of profits and losses for which Heze Prefecture is responsible are adjusted every year. After fulfilling their responsibility for profits last year, profitmaking enterprises are required to raise their profit level by 10 percent, thus increasing the base profit. Enterprises operating at losses brought their losses down to 68 percent of the allowed level last year; now they are required to bring them down to only 35 percent. The enterprises and the bureaus in charge found the new demands hard to comply with, and they did not know exactly what to do. After 5 months of hesitation and then the adoption of wrong measures, their profits

dropped by 50.9 percent compared with the same period last year. Practice has proved that these methods of "emptying the pond to get the fish" and "penalizing the advanced units" can only mean "more haste, less speed." Experience has shown the need for good basic work. We must conduct in-depth, meticulous investigations and carefully consider such new situations and new problems as the actual production level of the enterprises in the current year, the highest level they have ever attained, the level of the advanced units of the same trade, the standards set by the departments in charge, the increase or decrease of production tasks for the enterprises, changes in their product lines, the increase or decrease of raw material and product prices, and so forth, before we work out progressive and rational bases for the responsibility system. Some leeway should be left in determining the bases. The principle behind the base for the responsibility of profitmaking enterprises is that the increase in profits should be commensurate with the growth in production, and the margin of profit increase generally should not be wider than the margin of production growth. Furthermore, the base, once determined, should remain unchanged for preferably 3 years, so that the enterprises concerned can have time to work out long-range plans, increase their financial sources, and rest to build up their strength.

2. "Treatment for poverty" and "treatment for idleness" should be mutually supplementary. People have said, "The responsibility system can cure poverty; the system of piecework wages can cure idleness; coordination of these two systems will promote the enterprise's growth." These remarks sound reasonable. In the case of Heze Prefecture, the system of responsibility has indeed attained the goal of "curing poverty." Before 1979, there was an average annual loss of more than 14 million yuan. After adopting the system of responsibility for profits and losses in 1980, the loss was quickly changed to a profit of more than 17 million yuan. Is not this an effective "treatment for poverty?" However, one of the two treatments was still lacking. The system of responsibility for profits and losses this year is still being carried out with 1980 methods, in which such responsibility was borne by the finance section and departments and by the enterprises, with no attention being paid to further improving the enterprises' internal relationship of distribution. Some enterprises which should practice the system of piecework wages have failed to do so, and their other economic responsibilities have not been clearly defined. Thus, the administration has become strict above the loose below, and it has been impossible to arouse enthusiasm in various quarters. This is another factor with adverse effects on economic results. For Heze, with its weak industrial foundation, "treatment for poverty" should be supplemented by "treatment for idleness," and these two treatments should be well coordinated in order to achieve better economic results.

3. Appropriately increase the share for individual workers and staff members. The Liangshan Paint Factory in Heze Prefecture and the finance department undertook the responsibility of handing over 1.2 million yuan to the state in 1980, and actually made a profit of 2,343,000 yuan, which was 1,143,000 yuan above quota. The above-quota profit was divided as follows: 300,000 yuan for the finance department; 736,000 for the enterprises; and 107,000 for the workers and staff members as a bonus. The amount of the bonus fund was less than 10 percent. There were 685 workers and staff members in the factory, and, as it worked out, each worker could get only 9.40 yuan for every additional 100 yuan of profit created. The workers' share was obviously too little. To our knowledge, the share for workers in many factories was even less. The question

now is: Since the Third Plenary Session of the 11th Party Central Committee, why has the peasants' unprecedented enthusiasm been sustained for such a long time? The basic causes are that their responsibility is specific and their benefits are direct. Of course, since industrial and communications enterprises are engaged in large-scale socialized production, their situation is more complicated than that of the countryside. Therefore it is necessary for leaders at various levels to conduct personal investigations and study; after working out a specific system of economic responsibility, they should correctly deal with the question of the distribution of benefits to the state, the collective, and the individual workers. It is particularly necessary for the benefits to be rationally distributed between the collective and the individuals within the enterprise. We must not confine our attention to the "major" issues and exclude the "minor" ones, and we should attach more importance to the benefits of individual workers. For a rational distribution of above-quota profits, the workers' share should be 15-20 percent. This method of distribution will truly embody the policy of "more revenue for the state, more retention by the enterprise, and increased income for the individual workers."

4. Greater decisionmaking power for the enterprises. The central task for the enterprise is to concentrate its efforts to increase production and to guarantee the implementation of state production and financial policies on increasing production and practicing economy, and on increasing revenues and curtailing expenditures. To accomplish this arduous task, the enterprises must have certain decisionmaking powers. After 1 year's experience in practice the system of responsibility for profits and losses in Heze Prefecture, many new situations and new problems have been brought to light. One of the main problems is that the enterprises with such responsibility do not have much power of their own because of the many direct interventions from the higher administrative organs in matters of production, supply and marketing, manpower, as well as financial and material resources. Thus it has been difficult for many enterprises to manage their businesses through either economic or administrative methods, and certain problems in enterprise management cannot be solved in time. Therefore, the higher administrative organs should emancipate their minds and improve the old method of administrative management by giving the enterprises more decisionmaking power in dealing with personnel and wage problems as well as in disposing of materials.

BRIEFS

CLOTH SHOE SALES UP--According to recent statistics compiled by the Wushi Department Store on the sales of clothshoes, 140,000 pairs of them were sold in 1976; 190,000 pairs in 1977; 240,000 pairs in 1978; 340,000 pairs in 1979; 560,000 pairs in 1980; and 450,000 pairs in the first 8 months of 1981. An investigation and analysis conducted by the research group of the Wushi Department Store in the suburbs and the county countryside showed the main cause of the continued increase of sales as follows: In the past, the shoes worn by our peasant brothers were mostly made by women in the countryside. In the past 2 years, because of the gradual implementation of various party policies in the countryside, these women have been busy with sideline production during the lax farming seasons. Thus instead of home-made shoes, people are now wearing those sold as commodities in the countryside. Hence the continued increase of their sales every year. In the course of the investigation, some peasant brothers expressed their views on these shoes and hoped to see three further improvements: 1. The production of shoes with different designs instead of the same old style and black color; 2. reduced production of medium-heel shoes and increased production of those with flat soles or curved heels; and 3. production of more different sizes and specifications to fit different lengths and widths of feet. They hoped the shoe-factories concerned would study and accept their views. [Text] [Nanjing XINHUA RIBAO in Chinese 31 Aug 81 p 2] 9411

GUIZHOU FINANCE, TRADE CONFERENCE--From 24 August to 1 September, the Guizhou Provincial People's Government held a conference in Guiyang Municipality on finance and trade work. The conference pointed out that this province's finance and trade work from January to July this year was good. The conference also pointed out that the drought situation of this province is serious. The conference held that in the light of this situation, all places must do finance and trade work well during the busy season this year. It is essential to do well in purchasing and selling grain, to strive to procure more agricultural and sideline products, to make overall arrangements for markets during the busy season, to strengthen control over markets during the busy season and over finance and credit and to implement management responsibility systems. FIFTY ECONOMIC LAWS, REGULATIONS DRAFTED

HK131244 Hong Kong WEN WEI PO in Chinese 12 Oct 81 p 3

[Report from Beijing: "More Than 50 Important Economic Laws and Regulations Have Been Drafted and Submitted for Examination"]

[Text] During the past few years, along with the perfection and strengthening of the socialist democracy and legal system, the work on economic legislation in our country has gradually been undertaken and relatively great successes have been achieved. According to incomplete statistics from 51 of the economic departments of the State Council, more than 200 various economic laws and regulations have been promulgated since 1977. Recently, the various departments of the State Council have drafted another 50 or more economic laws and regulations. Opinions on some of them are being collected and others have been submitted for examination. Among them are the state-owned factory law and law of economic contract drafted jointly by the State Economic Commission and other departments that have been organized by the Legislative Commission of the Standing Committee of CPPCC, and law of planning, law of statistics, law of mining resources, land law, grasslands law, water and soil conservation law, trademark law, petroleum law, water lanes law, highway traffic law, city programming law, patent law, bank law and insurance law, all of which have been drafted by various departments of the State Council.

The various departments of the State Council have been making preparations for drafting or have already started drafting another 50 or more economic laws and regulations such as state farm law, fishery law, post and telecommunications law, capital construction law, pricing law, commercial law, port law, aviation law, weights and measures law and budget law.

Moreover, more than 30 laws and regulations that have already been promulgated are undergoing revision.

More than 200 economic laws and regulations have already been promulgated. Among them are the six laws and regulations adopted and promulgated or approved by the CPPCC or its standing committee: "Law for the joint venture of Chinese and foreign capital," "income tax law for the joint venture of Chinese and foreign capital," "personal income tax laws," "(trial) forestry law," "(trial) environmental law" and "regulations for the special economic zones in Guangdong."

Seventy or more have been promulgated or approved for promulgation by the State Council, such as the "provisional regulations for carrying out the financial administration system (differentiating income and expenditures and allocating responsibility at various levels)," "provisional regulations for promoting economic integration," "provisional regulations for developing and protecting socialist competition," "regulations for strengthening the planning and management of capital construction and controlling its scale," "regulations for reproduction and protection of aquatic resources" and so on.

More than 160 have been promulgated directly by the various departments of the State Council. Among them are "trial regulations for contracts of industrial and mining products," "a new regulation for forbidding blind construction and redundant construction," "provisional measures for comprehensive quality control in industrial enterprises" and "provisional measures for export control system."

'WEN WEI PO' ON LONGYANGXIA HYDROELECTRIC STATION

HK140215 Hong Kong WEN WEI PO in Chinese 12 Oct 81 p 3

[Article by WEN WEI PO reporter Yang Tung-i [2799 2639 3300]: "First Visit to Longyangxia Hydroelectric Station"]

[Text] The Longyangxia hydroelectric station is the second largest hydroelectric station in China at present. It is situated on the Qinghai plateau, in a gorge at 3,000 meters above sea level. The gorge is narrow and long, surrounded on all sides by hills and is sparsely populated. This is the most appropriate place for the construction of a hydroelectric station.

In the early part of 1976, the experts and workers of the fourth bureau of the Ministry of Electric Power Industry, who had just finished working on the Liujiaxia hydrolectric station project, and the advanced units of the capital construction engineering corps, traveled thousands of li, to station themselves there and proceeded to carry out survey and capital construction work. Later, the staff members of the fourth bureau continued to arrive in a steady stream. After 5 years of hard work, they transformed the desolate features of the hills around Longyangxia into a small town covering an area of 4 square kilometers and with a population of nearly 20,000 people.

With the exception of rock, mud and sand, grass and the water of Huanghe River, Longyangxia has little else. It is not at all easy to build a small town from scratch or to construct such a colossal water conservancy project. Everything from a tiny screw to heavy equipment and from rice and flour to daily commodities must be brought in from Xining. Xining is about 200 kilometers away, and the fastest a car can get there from Xining is 3 hours. From Xining, one has to take the Qinghai-Xizang highway for about 85 kilometers and then turn onto the asphalt road built for Longyangxia. This road has been designed for loads up to 300 tons, mainly because they have taken into consideration the future transportation of the 300-ton generator set. Daily, convoys of trucks loaded with supplies and building materials can be seen traveling on this road.

At the beginning of 1980, the Huanghe River was blocked and its flow diverted by spillways. Work on the dam also commenced at that time. At present, excavation work on the foundation of the main dam has still not been completed. It is estimated that by June next year, the project of building the main dam can be formally carried out. When completed, the dam will stand 178 meters high and 890 meters long. The dam will be 18 meters wide on the top and 80 meters wide at the bottom, and will hold 24.7 billion cubic meters of water. Based on normal conditions, it will take 10 years to fill this reservoir. The construction of the main dam has been designed against a severe flood which occurs once every 1,000 years and tested for a momentous flood which occurs once every 10,000 years. It can withstand earthquakes up to 5 on the Richter Scale (according to records of this region, the highest for more than a century has only been 4).

The generating capacity of the hydroelectric station was originally designed for 1.4 million kilowatts. However, during the construction, they discovered three faults in the worksite which proved detrimental to construction and the building of the power plant. Therefore, they could only install four sets of generators. Upon completion, it will only have a generating capacity of 1.28 million kilowatts or an annual generating capacity of 6 billion kilowatt-hours.

The geological structure in the vicinity of Longyangxia is composed of black granite or diorite which is seriously weathered. During the construction, when they discovered that the existing faults had broken rocks, so for the sake of not affecting the quality and the safety of the main dam, the construction teams adopted the method of grouting to strengthen the faults. However, this greatly increases the use of cement and the design also has to be changed from time to time. Costs have also increased from the original estimate of 900 million yuan to more than 1.4 billion yuan. The costs also include compensiation which will be paid to the 20,000 people evacuated from the innuated area and the construction of towns and roads.

The Huanghe is a river with a relatively high sedimentation. However, situated on the upper reaches, the water sedimentation of the Longyangxia is not as serious as that of the Sanmenxia with its 1.3 billion tons of sediment a year. The Longyangxia will only have 23 million tons of sediment a year. The sluicegates of the hydroelectric station are so designed that the sediment can be completely discharged without silting up.

If everything goes well with the project, the first 320,000 kilowatt generator will be in operation by 1985 and all the others will be in full operation by 1987. As the hydroelectric station of Liujiaxia is at present already supplying electricity to Qinghai, Gansu and Shaanxi, therefore, most of the electricity from Longyangsia will be supplied to north China.

After the completion of the Longyangxia dam, the floodwater of the Huanghe River will to a very great extent be brought under control. Because the water of the reservoir can be regulated, it will play a vital role in combating drought and flood. At the same time, it can also regulate the supply of water so that all hydroelectric stations on the lower reaches will be able to bring their role into play and serve the people better.

'TA KUNG PAO' ON HONG KONG'S COOPERATION IN SHIPBUILDING

HK140957 Hong Kong TA KUNG PAO in Chinese 14 Oct 81 p 4

[Report: "China Shipbuilding Corporation Fetes Well-Known Hong Kong Personages"]

[Text] The China Shipbuilding Industrial Corporation gave a party at the Furama Hotel yesterday in honor of well-known Chinese and foreigners in various circles. The atmosphere was lively.

Zhang Youxuan, vice minister of the Sixth Ministry of Machine Building, addressed the party and expressed thanks to Chinese and foreign friends for their cooperation.

He said: "Since last year, the China Shipbuilding Corporation has successively established ties with businessmen of Hong Kong, Europe, the United States and other areas and have concluded contracts with shipowners abroad for the building of ships totalling over 600,000 tons. During this period, Sir Y.K. Pao of the Worldwide Group and [International United Shipping] [Gul Lian 0948 5114], Mr Pay Yu-hsiung of (Liancheng) [5114 2052], Mr Li Ka-shing of Green Island Cement, Mr John Murden of the Wheelock Marden Group, Mr Qian Jiang of (Hong Kong-Asia) [Gang Ya 3263 0068], Mr Zhuang Guilun of Hong Kong Shipping, Mr David Newbigging of the Jardine Group, Mr Situ Kun of Ocean Shipping and Mr Zheng Ruixiang of the (Ocean Shipping Service) [Hai Yang Chuan Wu 3189 3152 5307 0523] cordially cooperated with us and rendered us energetic help. Apart from the export of ships, our ministry has also accepted a contract for a petroleum drilling platform from (Huachang) [5478 2490]. We have further had a container deal with Mr Lin Liangcheng along the lines of compensatory trade. We have committed ourselves to the cooperative production of pleasure boats with Mr Zheng Daorong. We have also exported many kinds of machinery and equipment, instruments and meters. In addition, cordial talks on friendly cooperation are being held, with regard to many other projects. On behalf of the China Shipbuilding Industrial Corporation, we want to once again express our heartfelt thanks to all our old and new friends."

He said: "In order to develop our shipbuilding industry and to further make our proper contributions to international shipping, we are prepared to satisfy the demands of shipowners. We will follow flexible and varied cooperative patterns in gradually increasing the kinds and types of vessels. In regard to designing, we will not only adopt our country's advanced, economical and rational designs to serve our clients but will welcome cooperative designs from relevant companies abroad. We also welcome such designs as chosen by the shipowners themselves.

Regarding facilities for ships, equipment of world-famous brands, which is produced in China under a certificate of permission and whose quality is in line with international standards, may be chosen. If necessary we may also consider the use of products from various parts of the world, recommended by shipowners. Concerning the grading of ships, we have established cooperative relations with Llyod's, BAS, BV, NK, GL, NV and others. Shipwners are free to make their own choice. In sum, we will strengthen measures, shorten the required cycle, guarantee quality and make proper arrangements for service after delivery. This is to respond to and satisfy the aspirations and demands of shipowners."

Among those foreign and Chinese guests present at yesterday's party were Y.K Pao, Wang Kuan-cheng, Li Tzu-sung, Li Ka-shing, Ma Ching-hsi, Tang Hsiang-chien, Ku Kuo-min, Marden, Newbigging, Wei Erh-shu, and so forth. The director of this newspaper Fei I-min was also invited to the party.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

YUNNAN BANK LOANS PRODUCE BETTER ECONOMIC EFFECTS

Kunming YUNNAN RIBAO in Chinese 13 Sep 81 p 1

[Article by Fan Hepeng [4636 7729 7720]: "Yunnan Banks Make Loans With Better Economic Effects"]

[Text] Striving to stimulate the economy with the lever of credits, the People's Banks in Yunnan have enthusiastically supported the old enterprises this year in tapping their latent power and carrying out innovations and transformations and have achieved better economic effects. From January to July the People's Banks made short- and medium-term loans totalling 18.9 million yuan, a 61.9 percent increase over the same period of last year. These loans accelerated readjustment of the national economy.

In order to ensure proper use and better economic effect of loans, the People's Banks grasped three links in credit control. In close coordination with the departments concerned, the Banks intensified feasibility study of the projects to be financed by bank loans and repeatedly calculated the economic effects of the loans, stuck to the terms of loans, and guarded against blind construction and redundant construction. After determining the loans to be granted, the Banks did everything possible to help the enterprises concerned speed up the rate of construction progress and bring about early use of funds and early completion of projects. After the construction projects went into operation, the Banks helped the enterprises concerned extend the economic effects, recalled loans according to schedule and accelerated capital turnover. Between January and July this year, 193 projects financed by banks loans were put into total or partial operation, adding the value of output by more than 60 million yuan and the accumulation of funds by 16 million yuan.

The short- and medium-term loans granted by the People's Banks were selectively used as funds for tapping latent power and carrying out innovations and transformations of enterprises in light and textile industries and consumer goods producers. Loans made for these purposes during January-July this year accounted for 66 percent of the total loans made. Calculated on the basis of the economic effects achieved by 41 projects, output value has increased by 43 million yuan and accumulation of funds by 10 million yuan this year.

COORDINATION OF GEOLOGICAL PROSPECTING ACTIVITIES URGED

Beijing RENMIN RIBAO in Chinese 23 Sep 81 p 2

[Article by reporter Xiao Tihuan [5135 7555 3562]: "Socialist Cooperation Is Lacking Here"]

[Text] The approximately 800 square kilometers of extensive, rough mountain terrain west of Lingwu County in Henan, east of Lantian County in Shaanxi and bounded on the north by the Wei River and on the south by the Le River, is generally called the "Little Jinling Mountains." Starting in 1964, there have been numerous discoveries of ore deposits there. Thanks to the arduous efforts of the Henan and Shaanxi Provincial geological prospecting teams, to date the country has been presented with considerable commercial deposits of gold. The state has already constructed or is constructing a large number of large and medium-size mines, including the Jintongcha, Wenyu, Yangsaiyu, Dongtongyu, Shancheyu and Xitongyu mines, in addition to the large and medium-sized mines which are already in the exploration state.

However, this promising ore base is in very chaotic condition regarding both geological prospecting and extraction, and many questions require straightening out and resolutions.

At present, it is estimated that about 4,000 persons are involved in the search for ore deposits in the Little Jinling base area; they belong to the geological teams of the Henan Province and Shaanxi Province offices of the Ministry of Geology system, the geological teams of the Henan Province office and the Northwest Metallurgical Prospecting Company of the Ministry of Metallurgical Industry and the gold department of the capital construction and engineering troops, in addition to relevant geological teams of the Second Ministry of Machine Building system. These geological units do not have unified leadership and division of labor; they have their own superior organizations, their own programs and their own investments, and there is no communication between them; they are wary of each other and compete with each other. Especially in areas where mine completion conditions are relatively good, communications are relatively favorable, and exploration and extraction are relatively easy, the competition for territory and for mining sites is particularly strong. For example, last summer, on vein No 59 of Sifangou, Henan Province, the provincial metallurgical system's geological team had an exploratory borehole on the eastern section, and the provincial geological office's team had an exploratory pit on the western end. This year, on the southern slopes of the Little Jinling in Shaanxi, on a straight line passing through five communes between Cangzhuyu on the eastern end and Wangpaigou on the western end, the Northwestern Metallurgical Prospecting Company's team and the Shaanxi Province Geological office's teams are competing tooth and nail, and the various communes are at odds with each other in the search for ores; nobody will retreat a single step. This April, gold unit No 00523 also arrived at the central section of the Little Jinling Mountains on the Henan-Shaanxi border to look for gold deposits. On the basis of ore-bearing geological units, they marked out a 165 square kilometer working area; shortly afterward they came into conflict with the Shaanxi Provincial Geological Office's team in a 30 square kilometer area and overlapped the work of the Henan Province Geological Office's team in a 50 square kilometer area.

Overlapping in the search for mineral deposits leads to many abuses and great dangers.

First, it results in serious waste of state funds. The exploration of vein No 190, which is close to the Longhai Railway line in the north and located in Huanchiyu in Chengcun Commune, Lingbao County, is a typical case. This vein is less than 1,000 meters in length. Since this spring, geological team No 6 of the Henan province Metallurgical Exploration Company, in accordance with an exploration plan approved by the Ministry of Metallurgical Industry, subteam 9 of the Henan Provincial Geological Office's regional geological survey team No 1, subteam 2 of its prospecting team No 4, and subteam 2 of its excavation team, in accordance with an exploration plan approved by the Ministry of Geology, have had about 200 persons in action, competing over this vein, resulting in collisions between drilling rigs, the driving of tunnels in close proximity, trenches being dug side by side, pipelines being installed side by side, and residences set up side by side. Originally one set of production and living facilities was sufficient, but here there are two sets interfering with each other. According to work regulations for the ore deposits evaluation stage, the vertical distance betwwen boreholes and tunnels on vein 190 should be at least 90-120 meters. But the metallurgical team's No 601 borehole is only 14 meters vertically from the geological team's No 001 borehole. The metallurgical team's and the geological team's 4 tunnels are 10 meters apart vertically. In addition, in accordance with geological exploration regulations, boreholes and tunnels cannot both be cut at a given location. But the geological team has cut tunnel YM1 in a lower location, while the metallurgical team has drilled borehole No 1001 above it, so that the borehole nearly passes through the tunnel, and whe water injected into the metallurgical team's borehole flows freely into the geological team's tunnel.

In order to compete with these so-called "sister installations," the metallurgical team has invested 725,900 yuan and the geological team has spent more than 1.01 million yuan, so that the total investment is nearly 1.74 million yuan; if this work had been done by a single team, an investment of only 879,000 yuan would have been sufficient.

Second, it harms the unity among the geological workers. Some comrades in the Shaanxi Province geological office have generalized a "law": "Whenever a new promising large ore vein is found in a given location, there will be a dispute in that location, and bloodshed may even result." On 29 June of this year, company 1 of subteam 61 of gold unit No 00523 sent people to land belonging to Tonggu Brigade, Tongguan County, Shaanxi, where they took a bag (about 2 km) of ore samples from an exploration trench which subteam 2 of team 5 of the Shaanxi Province had cleared; the two sides had an argument and came to blows, and the personnel in question were beaten and bloodied.

Third, it produces an artificial hindrance to the development of geological work.

Geological work is scientific work of a highly investigative character,and requires many types of data and materials for analysis and research and for determination of the situation. But overlapping work and disputes over "fame and fortune" by geological groups from different departments, strict withholding of one's own data and strict secrecy, in addition to efforts to obtain one's rivals' data at all costs, are making relations increasingly strained. At vein No 190 in Huanchiyu [characters illegible] the geological and the metallurgical teams' drilling rigs work side by side and their tunnels run side by side, but as soon as one of the rigs obtains a core sample or a valuable ore sample is obtained in a tunnel, it is rapidly spirited away lest the competition sees it. As a result, no one has been able to accumulate a complete set of data, and the entire deposit was not yielded one complete exploration result to the commercial extraction departments, which has added to the difficulties of mine design and extraction.

Overlapping prospecting also disrupts the continuity and completeness of geological work. The geological organizations belonging to different systems are afraid of "trouble in the rear" and are impatient to spread out their network points and occupy territory, so that they are unable to concentrate fully on the geological procedure, involving overall surveys, detailed surveys, initial exploration and detailed exploration, but instead go from one deposit area to another to pursue their work; they are especially unable to guarantee that the data on commercial reserves will be turned over to the state as rapidly as possible for important ore regions. In the Henan Province section of the Little Jinling, the geological teams and metallurteams are constantly bunched together in the northern ore belt near the rail line and "follow in each others footsteps." On the other hand, in the southern ore belt where communications are difficult and the terrain is steep, a large quantity of work remains undone.

How can we rectify this irrational state of affairs? All parties must realize that they must rectify this irrational geological management system as rapidly as possible, break through the old restraints of the departmental ownership system, and institute unified management of the geological manpower in the geological departments and the various industrial departments. Some comrades believe that the Ministry of Geology or a newly created state mineral resources committee should exercise unified command, unified dispatching and unified disposition of all geological organizations. Under present conditions, geological exploration work in the Little Jinling mining base area should be managed in unified form by special offices designated by the Henan and Shaanxi People's governments or working groups dispatched by them, and the various systems' geological personnel should be coordinated so as to improve the current chaotic situation as rapidly as possible.

BRIEFS

ORE DISCOVERY--A new mineral--carbon-chromium ore--was recently discovered in Henan Province. It is a mineral with a high degree of hardness, second only to diamond. Its associated minerals are natural iron, natural gold, natural cobalt, natural chromium, as well as silicon carbide and diamond. This carbon-chromium ore was discovered by the Honan Geology Bureau's workers and the workers of field geological teams No 8 and No 10 while they were analyzing and studying the material composition of a rock body in the Liuzhuang district of Tongbai County, and was affirmed by the X-ray laboratory at Wuhan Geology College. [Text] [Beijing GUANGMING RIBAO in Chinese 21 Sep 81 p 1] 9780

GOLD, SILVER PRODUCTION--Production of gold and silver is satisfactory in Shanxi. Output of gold in January-July this year fulfilled 69.5 percent of the annual plan and that of silver fulfilled the annual plan ahead of schedule. In both cases, output sets a record level for the same period of the past. Enterprises producing gold and silver have strengthened business management and striven for contributing more to the state this year. The Taiyuan Copper Electrolytic Plant is pushing the economic responsibility system and striving to strengthen technical management and following the technological procedures strictly. In January-July, gold output increased 15.61 percent over the state plan and output of silver overfulfilled the annual state plan 46.9 percent. COMBINED PRODUCTION OF MILITARY, CONSUMER GOODS DISCUSSED

Taiyuan SHANXI RIBAO in Chinese 14 Sep 81 p 1

[Article by Pang Guisan [1690 2710 0005]

[Text] The Fifth Ministry of Machine Building recently held a meeting in Taiyuan for the sale of consumer goods in the North China area. It was attended by over 300 representatives from national defense and commercial supply and marketing organizations in Hebei, Nei Monggol, and Shanxi. Jia Yunbiao [6328 7189 2871], deputy governor of Shanxi Province, attended and addressed the meeting.

The various enterprises of the Fifth Ministry of Machine Building in the North China area, which have relatively better equipment and technical resources, are considered leaders in the field of machine building. Since the readjustment of the national economy, many enterprises have directed their efforts toward the development of production of consumer goods for the market, in line with the policy of producing military and consumer goods at the same time. The value of production now exceeds 100 million yuan. They have developed their own "flagship" and brandname products. The "Flying Saucer" sewing machines produced by the Shanxi Machine Tool Factory, the "Skyward" bicycles produced by the Taixing Machine Factory in Hebei, the steel-frame yurts for herdsmen produced by the No 1 Machine Factory of Nei Monggol, the electric meters produced by the No 2 Machine Factory of Nei Monggol, and the "Arrow" brand mopeds jointly produced by several large factories have been favorably received by consumers since they were put on the market. In order to speedily develop Shanxi into a base for the production of coal as a source of energy, the Xinhua Chemical Engineering Factory, after weighing what consumer goods to produce, has decided upon the large-scale production of rubber conveyer belts for coal mines and coalpits. They have been well received by the mining enterprises.

At the meeting to discuss the production of consumer goods, 18 war industries jointly organized an exhibition and sale of consumer goods. A vast array of light industrial products, chemical industrial products, machinery and electrical equipment, alternating current appliances, and steel and wooden items of furniture attracted salesmen and buyers from various areas. The transactions which were consummated at the meeting indicate the vast potential of implementing the policy of combining the production of military and consumer goods.

BRIEFS

1981 HOUSING CONSTRUCTION--Beijing, 1 Oct (XINHUA)--Housing construction in the Chinese urban areas has been progressing at a fast pace in the first three quarters of 1981, a spokesman of the State Capital Construction Commission said. The amount of investment in housing construction, and the floor space of housing under construction and completed in the first eight months approached the level in the corresponding period of 1980, a record year for China's urban housing construction, he said. "The new achievement," he noted, "was made despite the cut in China's total national capital investment for the current year." Between January and August, housing starts covered 87.78 million square meters while housing completions totalled 19.51 million square meters. The State Council approved an additional investment of 3,000 million yuan pooled by the localities and enterprises for the housing programs, the spokesman added. Funds pooled by enterprises accounts for more than a half of the total housing investment this year. In some provinces, the percentage has risen to 60 or 70 percent. COUNTRY FAIR TRADE THRIVING THROUGHOUT YUNNAN

Kunming YUNNAN RIBAO in Chinese 5 Sep 81 p 1

["Blooming Country Fair Trade in Yunnan's Towns and Villages"]

[Text] Country fair trade is blooming in Yunnan's towns and villages this year, with more commodities appearing on the market, an increased volume of business, and prices remaining stable and low.

There are 2,190 country and village fairs in the province, an increase of 52 compared with those at the beginning of this year. According to figures from 22 fairs, the volume of business at the fairs has increased 25.6 percent compared with the same period of last year. Eleven of the 15 kinds of commodities, including fat and oil-bearing materials, meat and eggs, vegetables, sundry goods for daily use, and manufactured goods, showed an increased volume of business in terms of amount of money. Among 12 major commodities, including rice, maize, rapeseed oil, pork, eggs, vegetables, piglings, cattle, horses, and mules, 10 showed increases in the volume of business. With a bumper harvest of rapeseed gathered this year, vegetable oil for food appearing on the market greatly increased, with the volume of business increasing 180 percent over the same period of last year. As for the remaining nine kinds of commodities, increases ranged from 14.7 to 70.6 percent. Thanks to the development of trade at fairs, a gratifying situation has appeared in many parts of the province: the supply of vegetables is not scarce in the off-season, there is an ample supply of meat and eggs, and native and special products are abundant.

Toward the end of July, the general level of prices at trade fairs was down 5.6 percent compared with the same period of last year. The difference between the prices at fairs and the official prices was brought down from 136.9 percent at the end of last year to 129 percent this year. Grain prices dropped conspicuously, down 35.7 percent per jin of maize; this was the lowest level in our province in years. Prices of rice, broad-beans, soybeans, and wheat also dropped between 8.4 percent and 14.4 percent.

Another important factor in the blooming trade at fairs is the appropriate restoration and development of individual industrial and commercial enterprises. By the end of July, 19,000 individual industrial-commercial enterprises, with more than 20,000 people, have registered and received licenses. Their numerous business locations and centers, their flexible operation, and their good service have added color to trade fairs.

DOMESTIC TRADE

COUNTY TRADE FAIR DOES FLOURISHING BUSINESS

Kunming YUNNAN RIBAO in Chinese 8 Sep 81 p 2

[Article by He Maohua [0735 5399 5478] and Wu Wensheng [0702 2429 0581]: "Thriving Livestock and Commodities Trade Fair"]

[Text] This year the annual livestock and commodities trade fair of Lijiang Naxi Autonomous County was held between 9-23 August. Commune members from the counties of Ninglang, Zhongdian, Weixi, Heqing, Yongsheng etc. and the members of the various communes in Lijiang County of all nationalities, the Naxi, Yi, Tibetans, Bai, Lisu, Han and so on, all came to the trade fair to hawk their sturdy mules, horses and cattle. Traveling traders from Zhejiang, Hunan, Sichuan, Guizhou and from the counties of Binchuan, Heqing, Jianchuan, Weishan and Huabing within the province, set up over 540 general merchandise stalls at the trade fair and in the streets and lanes of Lijiang. The people could pick and choose as they wished from the dazzling array of goods. State, collective and privately run eateries were found everywhere, at intersections, along roadsides, wherever it would be convenient for customers. The grounds of the trade fair were filled with the hubbub of voices and presented a picture of prosperity.

On 15 August, as we arrived at the livestock market, an endless stream of people were circling around herds of cattle and horses making transactions. The livestock trade this year had two distinctive characteristics: firstly, there was a large quantity of livestock on the market that was of high quality yet reasonably priced; secondly, the majority of buyers and sellers were individual families. This was a new phenomenon that appeared once the party had put rural economic policies into effect. In front of us a middle-aged Naxi woman with a bull in tow had attracted quite a few buyers who examined it from head to toe. Some said its teeth indicated that it was in good shape; others said its shoulders were broad and strong. We asked her: "Which commune are you from: Is the bull collectively or privately owned?" "I am from Lashi Commune and the bull belongs to my family. In the past few years raising cattle and horses was said to be capitalistic, but present policies have improved and commune members have even been ordered to raise more livestock. Once I've sold the bull I must still buy a young female mule to take back home." The woman answered frankly and openly. The seller wanted 700 yuan for this bull. Some buyers offered 600 yuan. An old herder from Baishe Commune in Lijiang County circled the bull, looking at the front and back and finally made a deal for 660 yuan.

In front of the stand set up by the Lijiang County department store, more than 10 girls dressed in Bai costume were hovering around a 50 odd year old male commune member who was buying cloth. This was Hong Zhaolu [3163 6856 4389], the Bai commune member of the new sixth brigade at Jinshan Commune in Lijiang County. He was buying corduroy, blue khaki and other fine cloths of every description, in all 90 chi. Why did he buy so much cloth at one time? Hong Zhaolu said: "There are nine people in my family, even if each person sews one article of clothing it is still not enough. The girls want cloth of the finest quality and the boys want dika [3321 0595] fabrics. The colors on sale here aren't very attractive, I must go to the department store to buy some more then that should be enough." "Is your family doing well?" He replied: "We have food to eat and money to spend. To tell the truth, I also have 400 yuan in the bank and we still haven't touched this year's allotment of over 1,600 jin of wheat. We owe this good life to the party's good policies towards us peasants."

At this year's trade fair commune members bought more daily necessities, top quality merchandise and folkcrafts than at last year's trade fair. Binchuan County department store hauled a carload of woolen blankets into the market to sell and they were sold out before they had even set foot on the ground. The demand for womens jackets worn by the Naxi commune members and for horse bedding worth 149 yuan each exceeded the supply. On the afternoon of the 23rd, at the counter of the youth store on the new main street, we say a young fellow pick out a combination radio and tape recorder. He was He Shangguang [0735 1424 0342], a Naxi commune member of the Luxi Second Production Brigade at Longshan Commune in Lijiang County. He spent 376 yuan on this imported radio-recorder. We asked: "Do many of you commune members buy radio-recorders?" He answered in halting Chinese: "In the past few years food has been a problem, who could afford to buy such a thing? After the Third Plenary Session of the CCP, policies improved and our lives gradually got better. At present some commune members in the mountain areas have also begun to enjoy the foreign goods that the city people can afford."

A comrade of the trade fair secretariat told us that since the Third Plenary Session of the CCP, rural production has developed, the economy has picked up and the livelihood of the people has also improved. This trade fair was very successful. One aspect of this is described below. Those participating in the buying and selling of livestock at the trade fair came from Henan, Anhui and four other provinces, 22 counties, over 1,170 units, in all more than 2,300 people. In total, there were 9,149 heads of livestock on the market, an increase of 23.1 percent over last year; 5,130 heads were sold, an increase of 11 percent over last year; the total from transactions came to over 1.8 million yuan, an increase of 15.4 percent. Out of this, the number of livestock sold and the turnover of individual families constituted about 80 percent of the total number of livestock sold and the total turnover. In this trade fair, the earnings from commercial merchandise and the eateries came to over 1.9 million yuan, an increase of 81.8 percent over last year.

BRIEFS

HUNAN MINORITIES TRADE CONFERENCE--The Hunan Provincial People's Government held a conference on trade with minority nationalities and production of minority nationalities products from 17 to 23 September in Changsha. Some 400 people from various departments concerned attended the conference. Shang Zijin, vice provincial governor, also attended the conference and gave a report. The meeting held: despite flaws and shortcomings, our province has scored remarkable achievements in developing trade with minority nationalities trade departments in 1980 showed an increase of 880 percent compared with 1952, and the sale of products to the minority nationalities increased by 10 times. The conference also analyzed certain questions on the production of products for minority nationalities and trade with minority nationalities, and reiterated the party's policies toward the minority nationalities. The conference stressed: It is necessary to look after the lives of the minority nationalities and improve their backward cultural and educational state. CHINESE BUILDING WORKERS RATED HIGHLY IN IRAQ

Nanjing XINHUA RIBAO in Chinese 14 Sep 81 p 1

[Article by Lu Xiaolu [0712 2556 7216], Su Jianzhong [5685 1696 0022]: "Jiangsu Building Workers Win Good International Reputation"]

[Text] The building construction workers of the Jaingsu Branch of China Architectural Engineering Company, who went to Iraq February last year, have won good international reputation for fast rate of construction progress and high engineering quality and have earned large amounts of foreign exchange. "China's Jiangsu workers taking part in construction in Iraq may be given full marks for rate of construction progress, engineering quality and spirit of coordination," commented the chief of the Division of Overseas Operations under Japan's Dacheng (1129 2052) Construction Company.

The Jaingsu Branch took part in the construction of two 7-story general hospital buildings with a total floor space of 50,000 square meters, to be completed in two years under the terms of the contract. By the end of August, construction of the two buildings has entered the stage of interior fitting up. Pipe-laying and indoor ventilation, telecommunication, photographic equipment, and lighting installation have been completed over 50 percent. It is estimated that the total construction tasks will be fulfilled two months ahead of schedule.

The Jiangsu Branch's brilliant exploits in Iraq were attributable to careful selection of engineers, technical personnel and technicians strictly according to the requirements of the construction project. As soon as the Branch signed a labor service contract with Japan's Dacheng Construction Company at the end of 1979, the Branch mobilized the staff and workers within its operating range. Good thought, good technical skills and good physique were set as requirements to be made, and those technical personnel and workers who voluntarily signed up for the overseas assignments were stricly examined. From among 20 thpes of workers including masons, carpenters, bar workers, meter fitters and pipe fitters, the Branch selected 695 people. While working in Iraq these building construction workers observed labor discipline and foreign affairs discipline, united as one, cooperated with one another closely, sped up the rate of progress and ensured engineering quality.

The wisdom and strength displayed by the Jiangsu building construction workers in Iraq have drawn the attention of other countries. Several countries and regions have established business connections with the Jiangsu Branch, and some of them have signed new construction contracts with the Branch.

FOREIGN TRADE

BANKS LEND SUPPORT TO SPECIAL ECONOMIC ZONES

Fujian, Guangdong

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 9, 4 Sep 81 pp 33-34

[Article by Ding Ning [0002 0413]: "Support the Fujian and Guangdong Special Economic Zones in Getting Started"]

[Text] Following the Third Plenum of the 11th Party Congress, our country decided to pursue an open-door policy in our relations with foreign countries. In order to exploit the favorable conditions of Guangdong and Fujian provinces, which are in the subtropical zone, are adjacent to Hong Kong and Macao, and have rich resources, the central authorities decided to pursue special policies and adopt flexible measures with regard to these two provinces, and to set up special economic zones as an experiment, taking this as an important effort in restructuring the economic system.

The special policies and flexible measures adopted by the central authorities with regard to Guangdong and Fujin are embodied in the following: 1. Concerning financial and foreign exchange revenues, a system is enforced whereby the province concerned underwrites the delivery of its quota of revenues and keeps the revenues above the quota or places the greater part of the revenues above the quota at its disposal. 2. With regard to goods and commercial administration, a policy of appropriately utilizing market adjustment under the guidance of state plans is carried out in order to stimulate economic growth as quickly as possible. 3. Concerning planned management, price management, labor management, and economic activities with foreign countries, the powers of the provinces concerned are expanded. 4. Special economic zones are established as an experiment, overseas Chinese capital and foreign capital are vigorously absorbed, and advanced technical and administrative experiences are brought in from foreign countries in order to develop the economy of the special zones.

Thanks to the implementation of the special policies and flexible measures drawn up by the central authorities, and thanks to the support from the central departments concerned, the economy of Guangdong and of Fujian has shown marked development and change in less than 2 years, as expressed strikingly in the following:

1. Faster development of production. Compared with the previous year, agricultural-industrial production increased 8.2 percent in Guangdong and 10 percent in Fujian during 1980, thus beginning change from the slower growth rate of industrial-agricultural production, compared with the national average, that had been seen over the years in the two provinces.

2. Adjustment of the economic structure. In agriculture, grain production has been firmly grasped and production of industrial crops is being vigorously developed. In 1980, grain output topped the record level in the two provinces, and industrial crops such as sugar-yielding materials and sugarcane showed great increases. In industry, the proportions of light and heavy industries have been adjusted and light and textile industries vigorously developed, with the result that the proportion of light industry in the two provinces has risen from 59 percent to 62 percent of total value of industrial-agricultural output, while that of heavy industry has dropped from 41 percent to 38 percent. The proportions between agriculture, light industry, and heavy industry have initially been brought into line.

3. The role of market adjustment is being brought into full play under the guidance of state plans. With the expansion of market adjustment, the channels of circulation are opening and the growth of commodities is being promoted. Last year, products adjusted by the market accounted for around 40 percent of the total value of Guangdong's industrial output. In Fujian, the economy is being enlivened, with commodity production developed and commodity exchange expanded.

4. Faster economic intercourse with foreign countries. Exports from the two provinces topped record levels last year, with Guangdong registering a 27.9-percent growth and Fujian a 47.2-percent growth compared with the year before the last. Furthermore, the two provinces have developed the processing of imported materials, assembly operations, compensation trade, joint ventures, cooperative production, etc.; have brought in foreign capital and technology; have broadened the avenues for employment; and have promoted economic growth.

5. Under the system of underwriting delivery of quotas of financial and foreign exchange revenues, incentives are being provided for increasing revenues, retrenching expenditures, and generating foreign exchange earnings. Guangdong's and Fujian's financial and foreign exchange revenues showed increases in 1980 compared with the previous year, and their current year's revenues and expenditures were balanced with some surplus. The portion of foreign exchange earnings retained by the two provinces in 1980 showed substantial increases over the previous year. The growth and proper use of the foreign exchange earnings retained by localities have given strong impetus to economic readjustment in the two provinces.

6. New progress of the experimental operation of special economic zones. The plan for establishing four economic zones--Shenzhen, Zhuhai, Shantou, and Xiamen--has been preliminarily worked out, preparatory work is moving ahead, and economic legislation is gradually being substantiated. The Shenzhen and Zhuhai special economic zones are starting off with a speedup of their basic facilities. Some factories and enterprises are being run as an experiment, and utilization of foreign and overseas Chinese capital has begun. The special economic zones are marked by developed industrial-agricultural production, increased income of the masses, and good public order.

The decision to pursue special policies and adopt flexible measures for operating special economic zones as an experiment in Guangdong and Fujian was made under the guidance of the correct line of the Third Plenum of the 11th Party Congress. We must go a step further and set our minds free. We must make a clean sweep of the "left" ideological influence and correctly understand and implement this decision. This is not merely a question of developing the economy of the two provinces, but is also a bold attempt to adjust production relations and to restructure the national economic system in line with the actual level of our productive forces. It is of momentous significance. Internationally, our country's special policies and flexible measures to operate special economic zones as an experiment are being watched with great interest and given great importance, and leading economic personages from many countries and regions have come or sent their representatives to study the conditions and problems of the two provinces--particularly the special economic zones. This reflects from another viewpoint the importance of pursuing special policies, adopting flexible measures, and establishing special economic zones in the two provinces.

As a state bank specializing in foreign exchange operations, the Bank of China should support Guangdong and Fujian in getting started. Over the past 2 years, on the principle of adhering to the policy of centralized management and unified operation of foreign exchange activities, the Bank of China has given special support to the two provinces. The Bank has given its support to carrying out the system whereby localities deliver their quotas of profits; it has expanded local powers to examine and approve foreign exchange loans at favorable terms; and it has arranged for its Guangdong and Fujian branches to speed up the establishment of organizations, according to work requirements. In addition, the Bank of China's Guangdong and Fujian branches are being given support in serving the local economy, promoting economic activities with foreign countries, increasing exports, and generating more foreign exchange. From now on, we will go a step further and correctly handle the relations between the special and the particular, between centralization and decentralization, and between the parts and the whole. With the fulfillment of state foreign exchange tasks and the implementation of provisional foreign exchange relations as the premise, we will go a step further and give the two provinces more self-management power for using and managing local foreign exchange. With a view to efficient management and to the use of local foreign exchange earnings that are retained, we will adopt more flexible measures for the use, turnover, and transfer of foreign exchange, so as to ensure that hard-earned and limited foreign exchange is put to the best use. The Bank of China will support its branches in the two provinces in bringing into full play their role as state banks specializing in foreign exchange operations, in fully utilizing special policies and flexible measures, in promoting faster growth of the economy in the two provinces, and in starting to restructure the economic structure.

Xiamen Municipality

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 9, 4 Sep 81 pp 35-36

[Article by Fang Mingzhi [2455 2494 2535] and Lin Duansheng [2651 4551 3932]: "Banks in the Special Zone Should Support the Special Zone's Economic Development"]

[Text] Xiamen Municipality, Fujian Province, which is famous for its scenic beauty and for being springlike all year round, is a famous scenic spot as well as the well-known hometown of overseas Chinese. It has a broad natural harbor in which steamships with a displacement of several tens of thousands of tons can be berthed. Adjacent to Hong Kong and Macao, and with the Xiamen-Yingtan Railroad reaching the municipal area, it has good river and land transportation facilities and favorable conditions for expanding economic activities with foreign countries. The State Council approved the establishment of a special zone in Xiamen in 1979. Xiamen will be built into a special economic zone with emphasis on processing export goods--embracing the tourist trade, residential quarters, building construction, science and technology, culture and education, and the comprehensive development of farming, forestry, animal husbandry, sideline production, and fishery.

Diverse sectors of the economy (in particular, foreign capital brought in) exist side by side in the Xiamen special economic zone. Products are geared mainly to export and are more affected by international market and the law of value. Therefore, simultaneous with applying planned adjustment and domestic market adjustment, it is quite important for banks to utilize the international market more effectively and to regulate the economy of the special zone from the standpoint of utilizing overseas Chinese and foreign capital, bringing in advanced technology and increasing exports and foreign exchange earnings. It occurs to us that development of the economy in the special zone can be accelerated by stepping up banking operations in the following areas:

Supporting the development of the food industry. Xiamen's food industry output, which accounts for 60 percent of the value of municipal industrial output and 46 percent of the total volume of export purchases, is an important pillar of the municipal industry and of exports to foreign countries. In particular, by developing the food industry and expanding exports, Xiamen, as a special zone participating in the international division of labor, and geared to the international market, can generate more foreign exchange earnings for the state. Banks have paid attention to giving full play to the natural and economic superiorities of the zone from the overall economic angle. They support the communes, brigades and individuals in developing a diversified economy. Taking account of the distribution of raw material base and helping communes and brigades to implement the production responsibility system in its various forms, to devleop various combinations, and to turn out products with native features. Banks are building links and bridges among enterprises, communes and brigades, farms, and forestry centers, assisting them in signing contracts for joint operations and supplying them with funds. These measures have promoted the development of the food industry in Xiamen.

Supporting enterprises in "support exports with imports" and in generating more foreign exchange earnings. Taking account of market requirements at home and abroad and the state of foreign exchange clearance, banks are supporting enterprises in increasing the production of salable, low-cost, good-quality goods that generate more foreign exchange. Banks in Xiamen have set their minds free and relaxed their policies, letting the enterprises in the special zone have definite self-management power to apply their funds. On the principle of "spending less and generating more foreign exchange," the enterprises are allowed to adopt flexible and diversified patterns of trade and to "support exports with imports" by utilizing the portions of foreign exchange retained (by locality and enterprises) to import raw and supplementary materials that are in severely short supply at home,and by expanding exports to generate more foreign exchange. Banks are giving loans to those enterprises that need Renminbi to buy foreign exchange in order to import raw and supplementary materials. For example, the banks supported the Xiamen Cod Liver Oil Plant in compensation trade in the form of barter: 200,000 bottles of yin-er cod liver oil (equivalent to HK $1.04 million) were exchanged for 100 tons of condensed soya oil for food (priced considerably lower than the purchase price of raw materials of a similar nature), 3.5 tons of vitamin A, and 18 kg of vitamin D powder (the total being equivalent to HK $1,024,000). The barter saved 400,000 yuan in production costs and increased exports of cod liver oil, thus killing two birds with one stone.

Supporting old enterprises in tapping their latent power and carrying out innovations and transformations. Xiamen port is open, and foreign merchants and overseas Chinese merchants are arriving in a continuous stream. This creates favorable conditions for enterprises to know the price situation, to collect data, to better the quality of their products, and to improve their packaging. Products from many enterprises have entered the international market. But the production capacity of some enterprises has fallen behind market requirements at home and abroad, and their products cannot cope with the demand. They have a pressing need to add equipment. The banks are voluntarily supporting these enterprises with funds to tap their latent power and to carry out innovations and transformations. With the support of the banks, these enterprises are rapidly filling the gaps and expanding production. Take the No 2 Plastics Plant, for example. Its "608" and "315" plastic slippers have had a good market for 19 years and are known in Hong Kong and Macao as "king slippers." For a time, supply fell short of demand. Domestic orders totaled 530,000 pairs this year, but the plant could supply only 115,000 pairs. As for the export demand, foreign merchants are prepared to purchase whatever quantity is available. The bank promptly gave 530,000 yuan in short- and intermediate-term loans to finance the purchase of equipment and components. The plant has bought two 400-g plastic-injection machines, one dense-smelting machine, and one high-speed kneading machine. It is anticipated that after these machines are put into operation, production of slippers can be up by 1 million pairs a year.

Supporting enterprises in merging and organizing specialized production cooperation. Specialized production cooperation is an important way to expand production capacity and increase economic results. Availing themselves of their extensive credit connections, the banks are taking an active part in investigation and research and in overall planning. Relaxing or tighting up credits, the banks organized specialized cooperation among the enterprises. The Xiamen Bearings Plant switched its production mainly to export and produced small bearings according to the requirements of foreign merchants. These products were in great demand in 20 countries and regions. But the plant's production capacity was unable to cope with the large number of orders. In addition to helping the plant tap its latent power, the banks helped the plant to merge with the Qianxian Instruments, Meters, and Machinery Plant and to proceed with specialized cooperation in production. The banks granted the Qianxian Plant short- and intermediate-term equipment loans so as to fill up gaps and finance the purchase of components of equipment; as a result, the output of bearings doubled and redoubled. Some 1.34 million sets of bearings were exported last year, earning U.S. $560,000 in foreign exchange.

Supporting enterprises in developing "three forms of trade." Processing of imported materials, compensation trade, and processing and assembly--these forms of economic activity are important patterns for utilizing foreign capital, bringing in technology, and developing foreign trade. The banks support enterprises in developing these "three forms of trade." The banks keep track of the contracts signed by various enterprises with foreign merchants, and they make loans to finance purchase of components necessary for the equipment brought in through foreign trade, thereby providing the enterprises with an integrated set of equipment. For example, the original equipment of the Xiamen Canned Food Plant had only a 6,000-7,000-ton capacity for production. Its capacity for turning out filled cans had been expanded to 12,000 tons in recent years, but its production of empty cans could not keep pace. The supply of empty cans was short in the brisk production season, making it necessary to seek aid from other localities. Last year, the plant brought in one canmaking machine, using canned mushrooms as the item of compensation. Installed in October, that same year the machine expanded its production capacity and turned out 170,000 empty cans a day, capable of filling 34 tons of canned food. This resolved the plant's problem of expanding production capacity and aided fraternal plants. Moreover, the plant has paid off the equipment loans provided for foreign merchants.

Performing all-round service to accelerate construction of the special zone. The banks are supporting and cooperating with the departments concerned in attracting foreign merchants and overseas Chinese merchants to invest in enterprises, set up factories, or join us and cooperate with us in operation and production. The banks and departments concerned have attracted foreign capital to build tourist agencies, restaurants, living quarters, scenic sports, and develop tourist trade. These kinds of business expand mainly by utilizing overseas Chinese capital and foreign capital, but the banks give their support in the form of Renminbi in order to speed up economic development in the special region.

With a view to giving effective play to the banks' regulatory role in the economic development of the special zone, promoting the development of a commodity economy in the special zone, quickening the steps of construction in the special zone, and correctly handling the relations between the People's Bank and various specialized banks, we suggest:

1. Organize joint credits, make overall arrangements, and let different types of loans be granted by different banks. In recent years, several banks used to grant multipurpose loans. This method of granting loans is not conducive to the economical use of funds. We suggest that with the People's Bank as the leader, several banks organize joint credits and that overall arrangements be made for the funds, with consideration given to the direction of development of construction in the special zone, and that different types of loans be granted by different banks. Joint credits may provide conditions for flexible use of funds and avoid multipurpose loans, confusion in credit policy caused by differences in loan terms (including interest rates), duplication of loans, and wasted funds. With several banks jointly examining the loan items, the targets are broadened, the amount of the loans is large, and the types of loans are great in number. These factors are favorable to more economical use of credit funds from the broad angle, are favorable to competition with foreign countries, and are conducive to the economic effect of fund use. Taking the banks as a whole, joint credits are of great realistic significance in ensuring a balance between the total amount of loans and the source of funds, a balance between loans and goods, and the regulation of circulation of money in the special zone.

2. Open a foreign exchange in the Xiamen special zone. With the rapid development of foreign trade, the portions of foreign exchange retained by the locality and enterprises are bound to gradually increase. These small amounts of foreign exchange retained are scattered among various enterprises. Dispersion of the amounts is not favorable to their concentrated use, and thus they cannot play a great part. On the other hand, some enterprises have no foreign exchange and have to buy foreign exchange in order to bring in advanced equipment and import raw materials. In view of this, it is suggested that, under the leadership of the special zone administrative committee, a Xiamen foreign exchange unit be established by the Bank of China to regulate surpluses and shortages of foreign exchange, thereby making it easy to solve the problem of [having the] funds necessary to bring in new technology and key equipment.

3. Establish a banking research and economic information organization. The international market is fast changing. It is important for foreign trade organizations to have a profound knowledge of international market conditions and the needs of consumers and to acquire and apply economic information promptly, in order to be able to place themselves in a competitive position and open the way to establishing a foothold for their export goods. All this depends on the banks' promptly supplying accurate economic information. To this end, we suggest that, with the People's Bank as the leader, the research personnel of the Bank of China, the Agriculture Bank, and the Construction Bank get together to establish a unified banking research and economic information organization, perform credit consultative services, bring the banks' regulatory role into fuller play, and make banking operations serve construction of the special zone and expansion of exports.

FOREIGN TRADE

AID TO SPECIAL ECONOMIC ZONES IN GUANGDONG

Guangzhou YANGCHENG WANBAO in Chinese 2 Sept 81 p 2

[Article by Lin Bin [2651 3453]: "A Tentative Discussion on Developing the Role of Guangzhou in Supporting the Construction of Special Economic Zones"]

[Text] Guangzhou, the provincial capital of Guangdong, is not only the economic center of southern China, it is also the country's major port for foreign trade. The question of how to make full use of its role in supporting special economic zones and how to accelerate the establishment of special economic zones is clearly of great importance.

The purpose of establishing special economic zones is to stimulate foreign economic activity in the special zones, to promote the development of our nation's socialist cause and to speed up the establishment of the four modernizations. However, in order to develop the special economic zones, it is necessary to have the cooperation of the inland areas and above all, we must obtain the cooperation and support of the urban economic centers. Guangdong Province has set up three special economic zones: Shenzhen, Zhuhai and Shantou. The bordertowns Shenzhen and Zhuhai used to be rather backwards economically, culturally and in various other respects. They had hardly any industry to speak of. For us to establish special economic zones in such places, to introduce foreign capital and advanced facilities and to break away from the economically strong interior, particularly the urban economic centers of southern China, we need more than just the support and cooperation of Guangzhou.

Given the current situation, what is the best way to develop the role of Guangzhou and strengthen its cooperation and support of special economic zones?

First, we ought to provide goods and technical personnel for the purpose of constructing the special economic zones. At present the three special economic zones in our province have begun construction. They require large quantities of materials and technical personnel of all trades and professions. For example, in the construction business of Shenzhen; individual and foreign businessmen have contracted for construction projects for over 1 million square meters. Yet the current designing capability and construction force are quite unable to meet these demands. Guangzhou has had experience in the layout and construction of buildings and as long as the city planners and the construction force of Shenzhen band together and set up a joint planning company or set up several separate planning firms with the contract awarded by ballot, only then can there be effective support for the design and construction of special economic zones. Furthermore, construction requires a large amount of cement therefore, in addition, to relying on the inland areas for supplies and, in keeping with our long-range plans, we must build our own cement plant. Besides pooling capital with foreign merchants and Hongkong merchants to build a cement plant, the well-known cement plant in Guangzhou can also invest in building a plant in the special zones.

Second, we should support the development of commerce and service trades in the special economic zones. The population of Shenzhen and Zhuhai is larger than before, with the addition of the transient population the total population count is even greater. The Commerce and the service trade networks cannot meet the demands. In the haircutting business for instance, in the past there were only 20 or 30 barbers in the entire municipality and the number has not changed, as a result there are long lines at all barbershops. The famous barbershops in Guangzhou such as Beixiu, Haohan etc, could go to Shenzhen to open shops. Recently, Guangzhou's well-known Panxi restaurant made plans to open in Shenzhen and the Guangzhou biscuit factory has also set up a factory that is jointly operated by Shenzhen. In order to promote the prosperity of the markets in the special zones and to expand foreign trade, Guangzhou's famous shops such as Shecanguan, Yeweixiang and Taotaoju should go to the special zones to set up branches. Famous brand products of Guangzhou such as flashlights, batteries, electric fans, knitwear, Chinese and Western medicines etc, can also be manufactured at branch plants in the special zones. Thus, not only would they support the construction of special economic zones, they would also enhance their own reputation.

Third, there ought to be support for the subsidiary agriculture of the special economic zones. At the present time vegetables, pork, poultry, eggs, beef, mutton, fruit and other subsidiary agricultural products are barely able to satisfy the needs of the expanding special economic zones. The fruits and vegetables of Shenzhen and Zhuhai are in short supply and their fresh flowers cannot meet the demands of the Hongkong-Macao market. The peasants of the outskirts of Guangzhou have had much experience in growing gourds and vegetables and the flower growers of Huadi are also experienced in cultivating fresh flowers, therefore a large labor force could be organized in these areas to go into Shenzhen and Zhuhai to grow vegetables and flowers. The famous varieties of gourds, fruits and vegetables from the outlying areas of Guangzhou could be transplanted to the special economic zones, i.e., the cabbage of Xiaogang, the hot pepper of Cencun, the bitter melon of Changpeng, the loofah of Dengfend, the litchif of Zengcheng, the banaba of Shashe, the carambola of Huadi, the quince of Lingnan and so forth. In this manner, not only would we support the establishment of agriculture in the special zones but we would also expand the employment opportunities in Guangzhou and make progress in solving unemployment problems.

Fourth, we should systematically train personnel in technology, accounting, management, law, foreign languages, etc, for the special economic zones. At present, the Department of Foreign Trade in the special zones needs qualified accountants who are familiar with international trade; Shekou processing area needs personnel who have a thorough understanding of technology and foreign languages; the tourist center at Mt Shijing in Zhuhai needs English and Japanese speakers in order to expand their tourist trade; and lawyers are needed for economic regulation in the special zones. Training specialists of all trades and professions is a matter of top priority for the establishment of special economic zones. There are many ways to train personnel: the special economic zones could assign personnel from Guangzhou Vocational University, Secondary Vocational School, Secondary Technical School or the Worker's University at the factory to undertake the job of training personnel or alternatively, they could publicly announce an admission exam among student youth in Guangzhou and select the best to enter various specialized training courses for instruction and then once they have graduated, send them to each of the special economic zones to work. In addition, we could send them abroad and to Hongkong to study on an exchange program.

Fifth, we should organize concerned departments and staff members to intensify their research on the establishment of special economic zones. In recent years we have achieved great results in the task of constructing special economic zones, we have accumulated quite a few experiences and we have also encountered many new problems. The concerned departments and staff members of Guangzhou who have been organized by Guangdong Province, can begin research on the establishment of special economic zones. They can bring together the actual workers and those working on economic theory to study problems in a planned way, they can sum up experiences and, in good time, solve the problems of economic activity in the special economic zones in order to accelerate the progress of the construction of special economic zones.

The special economic zones of Shenzhen, Zhuhai and Shantou are oriented toward the world market and depend on the inland areas. They have secure economic ties with the urban economic centers. Developing the role of urban economic centers is of benefit to the construction of special economic zones and once the economic construction of the special zones is underway, it will promote the economic development of the key cities. After the effective measures taken in the special zones have been summed up and have been introduced to the key cities, they too may be of benefit to the establishment of socialist modernization.

BRIEFS

LIAONING EXPORT GOODS--According to statistics released by departments concerned, in the first 8 months of 1981 Liaoning Province fulfilled 71.5 percent of the annual export goods procurement plan and 75.4 percent of the annual export plan. It also overfulfilled annual export plans of key products, including Tussah silk and petroleum products by 40 percent. The export volume of goods such as grain, oil, textile goods, silk products, animal products, handicraft articles, metal products and machinery also increased over the corresponding 1980 period. Liaoning Province has established trade relations with 130 countries. At a handicraft sales exhibition in the United States, the provincial handicraft article import and export company achieved a business volume of 3.9 million U.S. dollars. [SK281114 Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 27 Sep 81]

PRINTING MACHINE SALES EXHIBITION--Beijing, 5 Oct (XINHUA)--More than 200 printing machines from 50 printing machine factories throughout China were on display today at the Beijing Exhibition Center as the First National Printing Machinery Sales Exhibition opened. The director of the exhibition said that foreign manufacturers and business people are welcome to visit the fair and discuss questions of technical cooperation. He said that invitations have been sent to foreign businesses and manufacturers including dealers in Chinese printing machinery, resident representatives of foreign businesses in Beijing and commercial officers of embassies. China has exported printing machines since 1956 and they now go to more than thirty countries and regions. It is expected that total value of exports will surpass five million U.S. dollars this year, an increase of 33 percent over last year. [OW051417 Beijing XINHUA in English 1217 GMT 5 Oct 81]

CONFERENCE ON DEMOCRATIC MANAGEMENT HELD IN SHAANI

Xian SHAANXI RIBAO in Chinese 3 Sep 81 p 1

[Article by Wang Chao [3769 6389], Shen Yunjun [3088 7189 7486]: "Shaani Provincial Committee Holds Conference on Democratic Management"]

[Text] A conference on democratic management was held by the Provincial Committee in Xian from 27 August to 2 September. Present at the conference were responsible persons of the provincial committees, staff offices, bureaus, prefecture and municipal party committees and government leaders, and responsible persons of trade unions. Comrade Wang Zhiguang [3769 1807 0342], vice chairman of the provincial trade union council delivered a report, "Further promote and perfect the system of workers' congresses." Secretary of the Provincial Committee Yan Kelun [0917 0344 0243] summed up speeches.

The attending comrades studied the relevant documents of the Central Committee and heard accounts of experiences given by the trade union of Shanglo prefecture, the party group for fifth machine building bureau of the provincial staff office national defense industries, the Chunhua county party committee, the provincial textile equipment plant, the Hanzhong Cement Plant, the Xian Machine-made Tiles Plant, the Baoji Printing Plant. These accounts broadened their horizon and raised their understanding.

Since 1978, the system of workers' congresses, to which the Provincial Committee attached importance, has gradually been restored and instituted in Shaani. According to figures from some 20 industrial bureaus, 80.3 percent of the central and provincial enterprises have instituted the system of workers' congresses. Among them, the system has been basically popularized in the systems of textile industry, machine-building industry, metallurgical industry, the fifth machine-making bureau, and railways. It has been instituted by 20 percent of prefecture and county enterprises. In Shaanxi, 1,108 enterprises have democratically elected team and group heads, section chiefs, and shop directors, and 61 enterprises have democratically elected factory directors and managers.

On the basis of affirming achievements, the attending delegates put forward existing problems. They took the view that while the system of workers' congresses has been instituted for central and provincial enterprises, only a few workers' congresses bring their role into play in the true sense of the word, and that most of the prefecture and county industrial and communications enterprises have not instituted the system. The main problem is that party committees for some enterprises do not fully grasp the importance of the system of workers' congresses. Some comrades hold that the system of workers' congresses means enterprises will have more mothers-in-law. Some hold that what enterprises lack now is not democracy but centralization. They are afraid the system will weaken the centralized leadership of the party and administration. Other comrades take the view that at a time when readjustment of the national economy is in progress and work problems are piling up, there is no time for holding workers' congresses. There are also some comrades who are afraid that with many outstanding jobs not yet done over the years to improve workers' living conditions and with some leading members showing unhealthy tendencies, they would be unable to get out of an embarassing situation and come to a happy ending once democracy is promoted.

The conference called on party committees at all levels, particularly the leading bodies of enterprises to bring their guiding thought in line with the decision reached in the relevant documents of the Central Committee and at the national conference on democratic management of enterprises, to rectify the erroneous views mentioned above, to increase their confidence, and with one heart and mind to popularize and perfect the system of workers' congresses through coordinated efforts and step by step. Where the system of workers' congresses has been instituted but not brought to perfection, the state-operated enterprises should strive, through rectification, to have the system instituted in the first half of next year. Where the system has not been instituted, the central and provincial enterprises should strive to have the system instituted in the first half of next year. Prefecture and county enterprises should strive to have the system instituted 50 percent in the current year and 100 percent in the first half of next year. Enterprises in the systems of finance-trade, farming-forestry, science-technology, culture-education, and health should carry out experiments in light of reality and with reference to the "provisional regulations governing workers' congresses for state-operated enterprises." Experiences should be acquired and popularized gradually.

GUANGZHOU TAKES STEPS TO INCREASE EDUCATION FOR WORKERS

Guangzhou YANGCHENG RIBAO in Chinese 3 Sep 81 p 1

[Article by Wang Huaji [3769 5478 1015]: "Guangzhou Promotes Education for Staff and Workers"]

[Text] According to the Guangzhou conference just concluded on the education of staff and workers, new progress has been made in educating Guangzhou staff and workers, but the steps taken are not big enough. Education has reached only 52.3 percent of basic-level units, and only 230,000 or 22.5 percent of the 1.02 million staff and workers surveyed have received education. In this respect, Guangzhou is still behind other advanced cities. Effective administrative measures must be taken to encourage and heighten the enthusiasm of staff and workers for learning science, technology, and culture, and to bring about the rapid development of education for staff and workers.

The conference drew up eight measures which will be put into effect after they are approved by the municipal leading body:

1. New staff and workers recruited in the municipality must have the cultural level of a junior middle school graduate. Peasant workers recruited in the suburbs must have the cultural level of a primary school graduate.

2. Apprentices to be confirmed as regular workers must have the actual cultural level of a junior middle school graduate, in addition to the qualification of technical skill. Those who have not attained this level must do so before they can be confirmed as regular workers.

3. Skilled workers to be promoted to grade 4 must have the level of a junior middle school graduate; those to be promoted to grade 5 and above must have the level of a senior middle school graduate or the actual cultural level basically equivalent to that of a graduate of secondary training school.

4. Skilled workers to be promoted to technicians must be at the level of secondary training school or above.

5. Middle-aged and young leading cadres at factories and mines at county-regiment level or at companies and institutions equivalent to county-regiment organizations should reach the cultural level of secondary training school graduates before 1985. In principle, cadres to be employed at this level from now on should be treated in accordance with this requirement.

6. Achievements by various units and leading cadres in promoting education for staff and workers are to be taken as one of the criteria for choosing the advanced.

7. Cultural and technical files for cadres, staff, and workers are to be kept by the personnel departments as one of the bases for routine checking, promotion, and salary increase.

8. Staff and workers released, or released part-time, in order to join an educational program will continue to receive nonproduction welfare benefits, and those taking part in a short-term study program will receive their basic wage bonuses.

PRC AVIATION ADMINISTRATION LETTER TO TAIWAN

OW061524 Beijing XINHUA in English 1506 GMT 6 Oct 81

[Text] Beijing, October 6 (XINHUA)--The Aeronautical Information Service of the General Administration of Civil Aviation of China (CAAC) has proposed to the International NOTAM (Notice to Airmen) Office of the Taiwan Flight Information Centre that they cooperate in compiling a new aeronautical information publication on China's civil aviation.

The letter which was sent in September said that the suggestion was made to help develop the civil aviation of the motherland and our common interests." It said that representatives of the Taiwan civil aviation authorities "are welcome to come to Beijing, Guangzhou or Shanghai and other places suitable to both sides. The Chinese people's government will assure their safety and free travel. We can also send our people to Taiwan if the Taiwan civil aviation authorities guarantee their safety and free travel." [all quotation marks as received]

If the Taiwan civil aviation authorities had difficulties in sending personnel to the mainland, the letter suggested contact by mail. Two copies of "Aeronautical Information Publication of China's Civil Aviation were offered which could be picked up from the CAAC office either in San Francisco or Tokyo.

On January 3, 1979, CAAC proposed to the Taiwan civil aviation authorities that there be talks on air service and indicated willingness to provide all conveniences for air service between the mainland and Taiwan Province.

In November 1979, Xu Keji, a CAAC official then in charge of ICAO (International Civil Aviation Organization) affairs, offered CAAC aeronautical information to the Taiwan civil aviation authorities and said that CAAC would like to exchange experiences with their colleagues in Taiwan. He proposed joint use of the technical data of the International Civil Aviation Organization to develop civil aviation and ensure flight safety.

The General Administration of Civil Aviation of China resumed its activities in the International Civil Aviation Organization in 1974.

TRANSPORTATION

CONTAINERIZED RAILWAY TRANSPORT IN CHINA DESCRIBED

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 4, Jul 81 pp 4-5

[Article by Zhou Dianpei [0719 3013 1173]: "Our Country's Developing Containerized Railway Transport"]

[Text] Containerized transport is a modern transport technique. Our country's railways adopted it back in the 1950's, but because it was impossible to provide enough components, its advantages were not fully brought into play, and in spite of the early start, progress was not rapid.

In recent years, containers have come into extensive use. In the mid-1970's, the Ministry of Railways first developed 1-ton containers, after which it put 5-ton containers into extensive use. In 1980, containerized transport was about double the 1979 figure and more than six times the 1978 figure, and it is forecast that its use will continue to increase. "Door-to-door" transport of containers is also being gradually developed, and many truck stations have begun providing such service. The vast majority of the containers which our country's railways currently use are closed general-purpose containers invested in by the railways and used free of charge, while a small number are containers prepared by enterprises themselves. The railways offer a preferential 80 percent rate for enterprise containers. In order to encourage the use of containers, many stations have instituted the four priorities: priority processing, priority shipping, priority entry into stations, priority loading on trucks, in addition to which they are not subject to loading stoppages and limited loading. Accordingly, containerized cargos are sent out more quickly and arrive faster, and thus are welcomed by the commodity organizations.

The advantages of containerized transport are primarily in the following areas:

1. Protection of goods

Because in "door-to-door" containerized transport the articles remain in their original packaging from the shipper's warehouse to the consignee's warehouse, there is no problem of misplacement en route, in addition to which loading and unloading are done by machinery, not manually, which greatly decreases damage. The situation has been greatly improved even with such fragile commodities as glass. For example, after the Beijing Electronic Tubes Plant began using containerized transport of vacuum tubes, the damage rate decreased from 20-25 percent to less than 8 percent. Currently half of the plant's shipments are containerized. In the past, losses and breakage of moatai liquor shipped throughout the country from the Zunyi South station of the Chengdu Railway Office were quite serious, but after container transport was adopted, loss and breakage ceased. Television picture tubes produced in Chengdu always used to be shipped by air for fear of loss or breakage. Starting in March 1979, containerized rail transport was used, and by November 1980 a total of 7,300 picture tubes had been shipped by rail without loss or breakage, the saving compared with air shipment has been about 770,000 yuan.

2. Savings on Packaging Costs

Because containers are shipped "door to door," it is unnecessary to fully package many articles; they may be wrapped or simply packaged and placed in the containers, which decreases packaging costs and materials consumption. For example, the automotive radiators produced by Shanghai Automotive Parts Plant used to be packed in small wooden crates, but after containerized transport was adopted the use of wooden crates was discontinued, saving 17,000 crates in 5 years, with a value of 1.06 million yuan, as well as conserving more than 5,000 cubic meters of wood.

3. Increased Loading and Unloading Efficiency

Loading and unloading of containers is mechanized. In the past, manual loading of one railcar generally required from 8 to 10 workers working about 2 hours, and accordingly was both laborious and time-consuming. Mechanized loading of a car now requires 2 to 4 workmen and a maximum of an hour's time, or sometimes as little as 20 minutes.

4. Simplifying Transport Procedures

In piece-by-piece rail transport, each item requires two labels, and each item must be accounted for individually. Because the objects are small and numerous, writing the labels, attaching them, accepting them, accepting the goods, loading, unloading and individual consignment of the articles are burdensome tasks for the commodity units and for the station handling personnel. Some small articles become buried in stacks of objects and it is very difficult to keep track of them, and this easily leads to errors. With containerized transport, small items are replaced by large containers, each of which has two labels, and the containers are handed over in sealed condition so that inspection and inventory are simple and worker effectiveness can be increased many dozens of times.

5. Faster Funds Turnover

Because containerized commodities receive priority handling, priority loading, priority entry into stations and priority loading onto trucks, the items are shipped more rapidly and funds turnover is more rapid. For example, the Shanghai Pharmaceuticals Wholesale Office shipped 50 barrels of ethylamino butanol to Guangzhou for 440,000 yuan. When they were shipped individually, shipping was delayed for 19 days, costing 1,200 yuan in interest. Subsequently using container transport, it sent another 40 barrels to Guangzhou at a cost of 400,000 yuan and they were sent out in 3 days, costing only 150 yuan in interest, a saving of 1,050 yuan. Not only was funds turnover accelerated, but the market supply was guaranteed.

In addition, containers can be received and consigned in open-air yards, solving the problem of insufficient warehouse space at some stations. In addition, they increase truck loading and unloading efficiency and cut truck turnaround time. In summary, containerized transport has advantages which are too numerous to mention.

There are still some problems with container transport; the three principal ones are the following:

1. Standards Problems

Currently the 1-ton containers used on this country's railroads have a capacity of 1.2 cubic meters; these meet the requirements for shipping small lots of separate items and allow loading of the rated tonnage on trucks, so that the trucks' load-carrying capacities are not affected, for this they have been welcomed by commodities organizations and station personnel. Five-ton containers present few problems for transport of separate items, but in the case of carload lots, because their volume and weight capacities are too small, they do not fully utilize the trucks' volume and weight capacities, and this wastes transport capabilities, so that transport personnel have complained and commodity units are unwilling to use them because they increase transport costs.

2. Transport Cost Problems

Containers are tools for integrated transport, and they span several stages of transport, so that they are subject to the problems of both railway transport and highway transport, producing a rather complex situation. Regarding the railways' future use of containers to solve the problems of piece-by-piece transport, the problems are not great. But in the case of commodities which fill whole cars in the first place, because of the small volume and weight capacity of containers, full use cannot be made of transport capabilities, this results in an increase in shipping costs that is unacceptable to the commodity organizations.

3. Management Problems

The purpose of railway containers is to solve the problem of piece-by-piece transport, but because of the current requirement that each container contain one lot, lots weighing less than 500 kilograms (which account for 84.5 percent of all lots) are excluded because they do not fill a container. If these lots were organized and transported in containers, it would be possible to greatly increase transport efficiency.

Moreover, in the container yards, the various loading-unloading and transport machines do not match up with the trucks, resulting in wasted energy. In addition, in organizing goods supply, and particularly in sending back empty containers, some stations organize objects which are not suited to the containers and which damage them.

To summarize, containerized transport has many advantages. In order to further consolidate and develop container transport, many problems require conscientious solutions.

BEIJING MEETING STRESSES PLAN FULFILLMENT IN INDUSTRY, COMMUNICATIONS, TRADE

Beijing BEIJING RIBAO in Chinese 20 Sep 81 p 1

[Article: "Make a Major 100-Day Effort To Fulfill and Overfulfill This Year's Plan"]

[Text] The conference of leadership cadres of the [Beijing] municipal industry, communications and foreign trade systems held between 14 and 17 September called upon the broad mass of cadres and employees to stimulate enthusiasm for a hundred days' major effort to fulfill and overfulfill this year's state plan.

In the course of implementation of the spirit of the 6th Plenary Session of the 11th Party Central Committee and promotion of the economic responsibility system, enterprise and employee enthusiasm have been more effectively mobilized, and a situation of energetic production, concern for management, and vigorous unearthing of latent potential has emerged. Total output value and profits paid to the higher levels by the industrial system were higher in the second quarter than in the first quarter, and the figures for July and August were considerably higher than the monthly average for the second quarter. Communications and foreign trade purchases and exports both overfulfilled the state plan. However, because industrial production in the first quarter was down 4.3 percent from the same period last year, total output for January through August was still 1.4 percent below the same period last year; in particular, heavy industry was down 8.7 percent and light industry was up 10.2 percent, but the increase in light industry output was unable to compensate for the drop in heavy industry. Thus the task of completing this year's industrial state plan in the last hundred days of the year is an extremely arduous one.

The conference pointed out that extensive ideological education must be carried on and the situation made clear; economic policies must be implemented, and the broad mass of cadres and employees must be mobilized to help the country out by bearing this heavy burden; a vigorous effort must be made in enterprise reorganization, waste and loss must be stemmed, and latent potential must be exploited; and production dispatching must be strengthened so as to increase the output of marketable items.

In January-August of this year, this city's foreign trade has already amounted to $380 million in exports. The conference concluded that this city's foreign trade must be in accordance with the characteristics of the capital and must better serve the capital's economic construction and the people's requirements. It is necessary to make an effort to invigorate trade and technical and economic exchange, and to use various techniques of actively expanding foreign trade; advantageous situations must be brought into play, markets must be opened up, and the number of new customers increased. The foreign trade management system must be reformed, and production enterprises must gradually be made into foreign trade economic entities; management and administration of foreign trade enterprise must be improved, and the ideology, organization and functional development of the foreign trade economic machinery must be intensified.

GENERAL

TECHNIQUES, SIGNIFICANCE OF TECHNICAL POLICY FORMULATION DISCUSSED

Tianjin KEXUEXUE [SCIENOLOGY] in Chinese No 4, 20 Aug 81 pp 31-34, 10

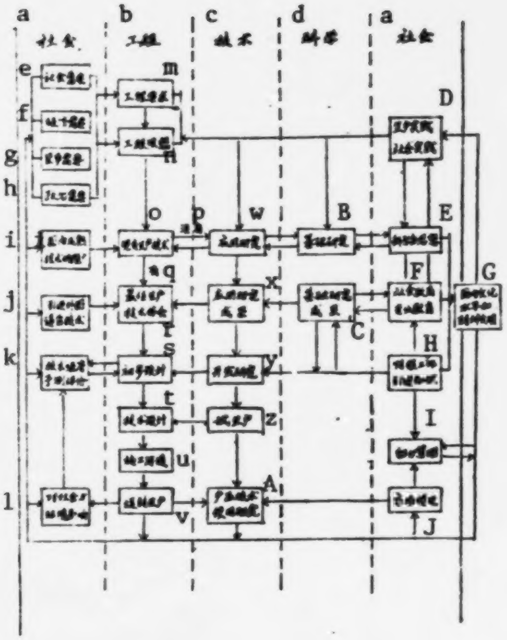
[Article by Yang Peiting [2799 3099 7200], China Research Institute of Scientific and Technical Information: "Technical Policymaking in Economic Work"]

[Text] 1. The Place of Production Technology in Economics and Society

The history of scientific and technical development is a process of action and reaction between science and technology on the one hand and economics and society on the other. Production technology is the most active factor in economic and social progress, but at the same time it is limited by economics and society. Under the influence of unfavorable economic and social factors, it may become stagnant and powerless; but in favorable conditions, it may manifest immense potential and great vitality.

The overall process of scientific and technical development, and particularly the recent development of modern science and technology, indicate that production technology is becoming increasingly closely connected to economics, society, science and culture, and that it (engineering) serves to link science to society and economics, thus occupying a pivotal position. Recently a scientific and technical work conference in this country proposed a development policy for the coming period. This five-point policy laid particular stress on production technology, because its development and correct utilization will be able directly to promote economic development and social progress; the key to development and to the correct use of production technology is "developing a rational technological structure," "correctly selecting technologies," and successful "technical development and expanded use of technology in factory and mining enterprises." There are two main sources of the knowledge for production technology: the first is "grasping, absorbing and assimilating foreign scientific and technical achievements," and the other is "guaranteeing that basic research will make steady progress on a stable basis." The five articles of this scientific and technical policy comprise an effective guiding ideology for developing science and technology and are mutually complementary, forming an organic unity.

If we "magnify" and "refine" this five-point scientific and technical policy, we obtain the following basic model for expanded reproduction of knowledge and products.



Key:

a. Society
b. Engineering
c. Technology
d. Science
e. Social needs
f. Economic needs
g. Military needs
h. Political needs
i. Expanded utilization of mature domestic technology
j. Importation of suitable foreign technology
k. Technical and economic forecasting and evaluation
l. Social and environmental effects
m. Engineering requirements
n. Engineering concepts
o. Existing production technology
p. None available
q. Available
r. Understanding of optimal production technology
s. Preliminary design
t. Technical design
u. Construction
v. Operation, production
w. Applied research
x. Results of applied research
y. Development research
z. Experimental production
A. Product technology applications research
B. Basic research
C. Results of basic research
D. Production practice, social practice
E. New scientific thought
F. Social education, specialized education
G. Domestic cultural level and spiritual culture
H. Information collection work, importation of knowledge
I. Organization and management
J. Market conditions

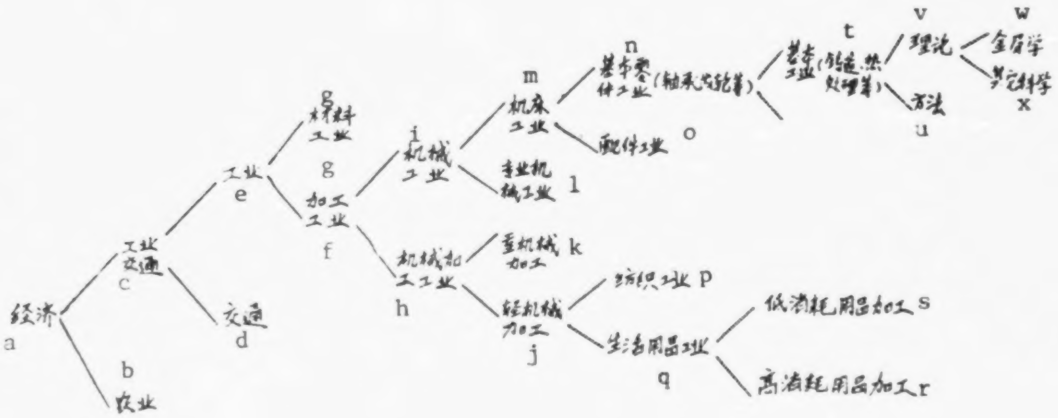
2. Some Methods of Policymaking for Production Technology and Economic Planning

The last 2 centuries' history of the economically and scientifically-technically developed countries makes it clear that the conversion of science and technology into productive forces is affected by many factors and has its own laws. If we understand the laws of conversion of science and technology into productive forces, we can utilize them and can adopt policymaking methods which are in accordance with them to make economic policy.

A. The Method of Hierarchical Analysis

All things are divisible and accordingly have a hierarchical structure. Penetrating into a hierarchy is a process of moving from quantitative to qualitative change and accordingly represents a change of essence in the process of development of things. When we speak of technological policymaking, we mean causing the original entity to make great progress by technical modernization, leading to a qualitative breakthrough. Accordingly, the fundamental aim of technical policymaking is to bring about more profound hierarchical changes, leading to a new stage or level; this is done by adopting new technical measures. How we conduct an analysis of economic hierarchy is a critical matter which will determine to which aspects the technical policymaking is applied.

Below we carry out an analysis of the usual hierarchical structure of economic components:



Key:

a.	Economy	k.	Heavy machining
b.	Agriculture	l.	Specialized machine industries
c.	Industry/communications	m.	Machine tool industries
d.	Communications	n.	Basic components industry (axle bearings, gears, etc.)
e.	Industry	o.	Fittings and parts industry
f.	Processing industries	p.	Textile industry
g.	Materials industries	q.	Daily-use articles industry
h.	Machining industries	r.	High-level consumables processing
i.	Machinery production industries	s.	Low-level consumables processing
j.	Light machining		

t. Basic industry (casting, * heat treatment, etc.)
u. Methods
v. Techniques
w. Metals science
x. Other sciences

On the basis of this hierarchical analysis of economic components, we obtain the following laws which merit attention in technical policymaking.

(1) Every hierarchy has a division into "light" and "heavy." The term "heavy" refers to hierarchical elements of a fundamental nature which are rather far from the ultimate product (direct consumables), while "light" refers to hierarchical elements which have an applied nature and are closer to the ultimate products (direct consumables). For example, agriculture among the economic divisions, communications as part of the industry-communications area, processing industries within industry as a whole, light industry within the mechanical processing industries, and the daily-use articles and other direct consumable products among light industry, are all "light" in character. Conversely, industry among the economic divisions, the materials industries within the industrial category, the iron and steel industry among the materials industries, and the machine tools industry among the mechanical industries, are "heavy." The relationship between "light" and "heavy" is the relationship between basic and applied, and between intermediate products and end products (direct consumables). Other cases are similar; for example, there is a "light-heavy" relationship between basic science and production technology within the scientific and technical field, and between data handling and information analysis (including specialized services) in scientific and technical information work.

What is the relationship between these two factors? First, we must note that the development of the "light" factor requires that it function as the overall objective and that the needs of the "light" element drive the "heavy" elements and expand their relative importance, with the result that the outmoded overall structure develops into a progressive overall structure (heavy → light). For example, the English Industrial Revolution began with modernization of spinning machine production technology, which was "light" with respect to the metallurgical and other mechanical industries of the time; but textile machinery drove the entire machinery industry, as well as power machinery such as steam engines. In Germany, railroads and chemical engineering drove the development of the mechanical, metallurgical, coal and other industries, another case in which the "light" drove the "heavy" and stimulated its development, while conversely the goal of promoting the development of the "light" element was achieved. Science and technology in the scientific-technical area, and data handling and information research in the information field, also stand in this relationship, and approaches which are at odds with this state of affairs are not beneficial to development.

(2) At a certain time and place and under certain conditions, the contradictions between a "light" and "heavy" pair in each hierarchical level will inevitably have a main aspect. The main contradiction aspects of the hierarchical levels form a main contradiction line, and a more profound recognition of the main contradiction line is the essence of structural analysis. By analysis of the main contradiction line we can find the "leading industry" the "leading technology," and the "leading element." These naturally constitute the focal points, and when we have found the path and direction of work, we have determined a policy: This is the policymaking

process. Of course the three great industrial changes which postwar Japan has made on the basis of economic structural analysis were a process of this sort. The first change was in 1945-50, when the military industry was replaced by light industry and agriculture, and labor-intensive industries and industries which gave a rapid return on funds were developed on a large scale. When the raw and other materials needed by light industry and agriculture limited their development, Japan entered a new stage in which it developed the materials industries (iron and steel, synthetic chemistry and the like), i.e., the capital-intensive industry stage, which was also an energy-intensive stage (1950-65), in which output value increased at a maximum rate. However, the large-scale development of the materials industries led to the "energy crisis" and the "environmental crisis" which induced Japan to change its orientation again from the materials industries to the knowledge industries, i.e., from funds-intensive and energy-intensive industries to knowledge-intensive industries (electronics, automobiles, aviation and instrumentation). Each change of orientation was a strategic policymaking process of abandoning the old leading industry and seeking the new leading industry. This strategic policymaking process was a process of selecting, investigating and utilizing production technology in a way that maintained a high rate of economic growth.

(3) The outer levels (large-scale concepts) determine the strategic position of the inner levels (small-scale concepts), and the contradictions at the inner levels are reflected in concentrated form at the outer levels. This can be seen rather clearly in a general way from the following hierarchy: economy--industry--processing industries--mechanical industry--machine tool industry--basic parts industry--axle bearing industry--basic process--theory--metals science.

If developing the production departments which equip the mechanical industry is a strategic policy decision aimed at meeting the requirements of absorbing labor, increasing output value and creating foreign exchange, it will inevitably affect all the production departments in the mechanical industry. Furthermore, if a basic process has not yet come into its own, it may negatively affect the quality of machinery in all sectors. This constitutes the reciprocal limitation between the internal and external levels of a hierarchy.

(4) Working backward when drawing up plans helps to resolve contradictions between hierarchical elements. We can use the structural analysis described above to determine a policy, but the arrangements (planning) for implementation of the policy require that we use the technique of working backward. The planning method which is generally used involves logical inference based on the old indicators and on expectations, thus determining the new indicators, then using these indicators to determine the measures to be taken; while the "working backward" method works backward from needs (i.e. of the market and the like). For example, at the end of the 19th century, Germany first reconstructed its railroads on a large scale in order to meet the most pressing needs, then developed its rolling stock industries, which in turn drove the mechanical, metallurgical and mineral exploration industries. Japan also used the technique of working backward in developing its iron and steel industry; it first expanded its steel rolling abilities, which then drove the iron and steel refining industries. The extrapolation method is an important method of finding latent potential when developing an economy and carrying out technical modernization.

B. The Wave Analysis Method

As described above, within a given period an entity has a time of quantitative change and also a time of qualitative change. The time of quantitative change generally is a period of low ebb, while the period of qualitative change generally is a high tide; and the succession of low ebb and high tide comprises the law of wave-like change. The social process of conversion of science and technology into productive forces reflects not only a spatial hierarchy, but also a temporal wave-like structure. Below we use historical examples to describe the objective nature of the law of wave-like structure and to show that this law can be used to predict the future and develop policies for active implementation.

1. Historical fluctuations of society, science, technology and production

	Ideological enlightenment	Scientific revolution	Technical revolution	Development of production
First high tide	13th-16th centuries	17th century	18th century	19th century
Second high tide	18th century	19th century	20th century (1930's-1950's)	20th century (1950's-1970's)
Third high tide	20th century (end)	21st century (beginning)	21st century (1st half)	21st century (1st half)

2. Historical fluctuations in the development of production technology

Production technology	Steam engines, textile machinery	Iron and steel, railroads, internal combustion engine	Nylon plastics, television, computers	Genetic engineering, new energy sources, television communications
High tide	1770-1830	1850-1900	1930-1950	1990-?
Low tide	1830-1850	1900-1930	1950-1990	?-?

3. History of production technology development in the United States

生产周期[a]	纺织、蒸汽、钢铁[b]	钢铁、铁道、石油[c]	电力、内燃机（汽车飞机）、机械[d]	合成化工、空间、原子能、电子技术[e]
[f] 高潮	1790—1837年	1843—1893年	1897—1960年	1965—1990年
[g] 低潮	1837—1843年	1893—1897年	1960—1965年	（1990—2020）年
[h] 性质	[i] 工具机革命 （机器、蒸汽机）	[j] 交通革命 （火车、轮船）	[k] 动力机革命 （电机、内燃机）	[l] 控制机革命 （计算机）

Key:

- a. Production cycle
- b. Textiles, steam power, iron and steel

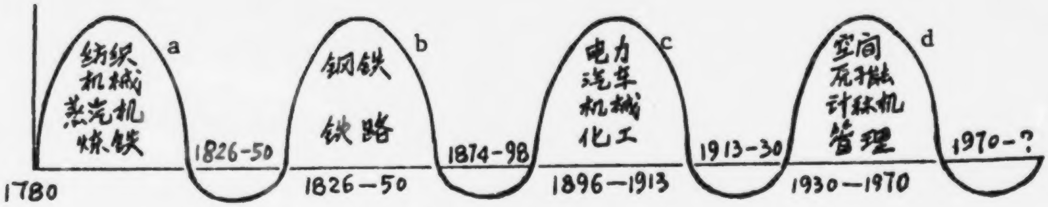
According to the capitalist economist Kondratieff's theory, the capitalist economy follows a wave pattern and is periodic in nature. Kondratieff's statistical analysis indicated that since the 19th century there had been a small economic crisis every 8 to 12 years and a major economic crisis every 50 to 60 years. His statistics went through 1921-22. He concluded that every 50 to 60 years there is a cycle of prosperity and depression. This law of wave motion is determined by the nature of the capitalist system. But is technical revolution a factor? Schumpeter's results indicate that it is. We may consider that the flourishing or decline of economic development directly influences technology, and a technical revolution also directly affects the economy; every time there is a cycle of economic prosperity and decline, there is a corresponding cycle of technological revolution and technological stagnation. This is a "resonance phenomenon." Kuhn's subsequent theory of scientific patterns is a development of this idea.

The figures below show that the "resonance" between economics and technology is quite apparent (the original source on the "resonance" between economics and technology only carried it out to 1920; the extension here was made by the present author).



Key:

- a. Textile machinery, steam engine, iron smelting
- b. Iron and steel, railroads
- c. Electric power, automobile, machinery, chemical engineering
- d. Space, nuclear power, computers, management

We must make it clear that the decisive factor in this "resonance" is the economic system, and technical revolution is the secondary factor, but the two are closely connected. Since a socialist country has a planned economy, can it have the "resonance phenomenon"? Theoretically it can, but it will not have the amplitude of variation that occurs in the capitalist market economy. The amplitude of the "resonance phenomenon" in socialism is determined by the scientific quality of planning; the factor of artificial control has a very large influence and accordingly, provided that we give sufficient attention to bringing the scientific spirit into play, we can make production technology play a greater role in economic planning. Capitalism, on the other hand, relies on the market to stimulate technology, and accordingly there is blind action and stagnation; this is a respect in which capitalism cannot compare with socialism.

C. The Integrated Analysis Method

The relationship between production technology and economic development is amenable to a relational analysis of different hierarchical elements in spatial terms, revealing the economic line of maximum resistance (the main contradiction line), so that a production technology strategy can be scientifically selected and economic development promoted. Temporally, it is possible to make a wave analysis and find the laws governing the changes in the technological motive factor in economic development, thus making it possible to take the initiative, adopt a new production technology strategy, and carry out economic planning with knowledge of the future. Finally, an overall synthesis must be imposed on the spatial and temporal technical strategy so as to arrive at an optimal plan which is in good accord with the real situation, which is truly capable of promoting economic development, and in which feasible technology is integrated with economic needs.

The main method of policymaking and planning is the integrated analysis method; the spatial hierarchy method and the temporal wave-motion method described above are preconditions for the integrated analysis.

There are two types of integrated analysis: One is the balance method, which assures that planning and policymaking for science and technology will be in harmony with economics and society and that the structure of production technology itself will be rational; the other is the optimum method, which assures that technological policymaking will, by the use of economic planning, be able to produce optimum social and economic effect.

First let us discuss the balance method. A given economic structure reflects the specific requirements of a particular social stage. In order to promote the development of the economy, it is necessary to bring the energizing factor of production technology into play and enable it to achieve its aim of changing the economic structure; this will lead to a new, unbalanced situation, and accordingly a new balancing method is required. This is the fundamental contradiction which economic planning must resolve. Accordingly, the balance method of planning is very important; it is used to harmonize all relevant areas with the sector in question. For example, social needs, resources, equipment, manpower conditions, relevant technologies and other related economic departments must all be suitably coordinated. Accordingly, fixing rational proportional relationships is the essence of the balance method and the main technique of unifying planning.

Only by coordinating expanded reproduction of knowledge with expanded reproduction of products is it possible to make the former effectively change the latter and cause the latter to progress. Mutual adaptation of production and consumption (market) is assured by analysis and research based on product balance charts. Finance, raw materials, equipment and labor are also handled on the basis of balance charts. But an even more important factor is generally neglected: this is the production and utilization of knowledge. A balance between the production and utilization of knowledge is also guaranteed by analysis using knowledge balance charts (e.g. dealing with the situation in relation to the intellectuals). Comparison of knowledge balances and material balances generally must be begun well in advance. First they are rationalized structurally, after which they are coordinated quantitatively.

We now turn to the optimization method. The main attention in policymaking and planning work is directed toward finding the most rational and effective program for use of such resources as materials, manpower and finance, as well as knowledge, so as to achieve the goal of maximizing results and minimizing losses.

Optimizing policymaking and planning requires stress on the use of modern mathematical methods; scientific mathematical methods are used to select from among a variety of policies and plans the program which gives the greatest economic and social effect. The criteria used for selecting and fixing a program are extremely important. It is generally necessary to choose several comprehensive indicators and certain principles regarding progressiveness and rationality of structure. These are used to determine procedures and objectives which are in keeping with the strategic requirements.

Mathematical programming is an important, highly vital method of selecting an effective program. Mathematical modeling can also be used in express the quantitative relationships between various indicators.

By using these methods it is possible to engage in specific policymaking and planning work aimed at satisfying the main requirements of the people's livelihood. One of the most important aspects of this work is economic and technical forecasting. When there are different economic objectives involved in satisfying the people's needs, there will be different technological strategies, and in addition there should be various different programs and forecasts of scientific and technical development. Only when these conditions are met can mathematical modeling be used to determine long-term requirements and to identify the final, practicable program.

Hence we have made planning which embodies the three elements of economics, society and the scientific-technical area our objective. In order to view these three as a unified whole, we must devote the requisite attention to integrated methods.

By an integrated method we mean a planning path which is based on the balance and optimization methods and takes the needs of people and society as its basic principles, which sets basic comprehensive indicators and then breaks them down into indicators for the various subordinate departments, and ultimately uses detailed computation data for the various departments to revise the initial assumptions. In this way, through repeated feedback, the method approaches closer and closer to the most realistic and rational policies and plans. The progression of whole → parts → whole and repeated revision constitute the normal logical process of policymaking and planning. This process proceeds via multiply-iterated revision of the macromodel, the intersectorial model and the micromodels. Its end result is an optimized overall balance plan, with economic policymaking running through the entire economic plan.

GENERAL

IMPORTANCE OF BETTER BUSINESS OPERATION STRESSED

Shanghai WENHUI BAO in Chinese 19 Sep 81 p 3

[Article by Shen Zhichun [3947 0037 2504]: "Give More Thought to Business Operation"]

[Text] At an exhibition of new products, a new type of shampoo was on display for sale. In four-size packages, large, medium, and small, the shampoo was for sale at different prices. The price of the large package was of course much higher than that of the small package, but in terms of content the large-size package was more economical than the smaller one. Yet, contrary to expectations, large-size packages were lying idle while sales of small packages were brisk at the exhibition. Why? It turned out that consumers in general bought small packages for a "trial" because, not knowing the quality of the new product and how good it was, they were afraid it would be unsuitable for their use. This gave the production unit an idea: it is necessary to study the psychology of consumers and give more thought to business operation.

Business Operation and Management Are Like Two Legs

The guidance of operational thinking is indispensible both in the sphere of production and in the sphere of circulation because it promotes the development of production and the growth of sales. Many instances of this can be cited. The guidance of operational thinking is reflected in the design of a product. In the past, travelling suitcases were portable. Now, some suitcases are fixed with automatic wheels, suiting the convenience of travelers and opening to the producers a good market for this commodity. Furthermore, when it comes to sales it is all the more necessary to be particular about the marketability of goods. In the survey conducted by the Shanghai nonstaple foods trade a few years ago, one thing was discovered: Arrowheads were sold out in some food markets but were overstocked in others during the winter. Why were sales of the same product entirely different in different areas? It turned out that in areas where arrowheads were sold out there were more northern Jiangsu inhabitants who loved arrowheads whereas the areas where the product was overstocked had relatively fewer inhabitants from northern Jiangsu. The proportion of goods was later adjusted with the result that the problem of "no stock" in one area and overstocking in the other was satisfactorily solved. These instances show that whether an enterprise attaches importance to business operations or not will greatly determine whether its economic effects are good or bad. The question even has a bearing on the future of the enterprise. If we want the economic effects of "booming business" we should pay particular attention to the strategic decisions in business operations. It is necessary to stress strategic decisions in business operations from the viewpoint of microeconomics and it is even more so from the viewpoint of macroeconomics.

Over the years, people's understanding about the question of strengthening business management and management of the national economy has been raised with initial results, but the importance of business operations has not been sufficiently stressed. Attaching importance to business operations is a problem that must be given full attention in our current improvement of economic work.

Business operation and management are often linked to each other and are two aspects supplementing each other. But they are not the same thing. As far as an enterprise is concerned, the main problem for management consists in coordinating the mutual relations between the upper and lower working procedures and among different departments within the enterprise, instituting and perfecting the necessary systems so as to ensure progress of various operations in an orderly and efficient way. The main problem for business operation consists in correctly determining the direction of production development and closely watching the connections between enterprises and the economic activities of society so that enterprises' production activities will become a part of social production activities.

As far as commodity production is concerned, the main problem to be solved by management consists in cutting down consumption as far as possible and lowering the cost so as to ensure that the time (including materialized time) taken to produce a certain product is far less than the socially necessary time of labor. The main problem to be solved by business operation consists in ensuring that the products turned out are put into the sphere of circulation as soon as possible and are sold quickly so as to realize the value of commodity according to the socially necessary time of labor. Ours is a planned socialist commodity production, and each commodity must realize its value in the sphere of circulation. Therefore, simultaneously with strengthening business management and management of the national economy, it is particularly important to stress the importance of knowing how to operate efficiently. It frequently happens that a well managed and highly efficient factory consumes less materials and produces at low cost but, through faults in operational decision or because of out-dated designs and colors or failure to publicize the special features of new products at the marketing link, finds its products selling slowly or long kept in stock with the result that they cannot quickly realize their value. Under such circumstances, consumption of less materials and low cost will count nothing. Strengthening management, it may be said, is aimed at laying a solid foundation for higher economic effects while improving business operation is aimed at creating conditions for increasing the economic effects. Business operation and management, like two legs of a man and two wings of a bird, move enterprise forward vigorously and develop the entire national economy steadily and soundly.

How to Ensure Efficient Operation?

The socialist system opens a broad world for the development of commodity economy. It acquires more conditions for launching various sorts of operational activities to suit the convenience of the masses under the guidance of state plans, making it entirely possible to unify operation and management and achieve better economic effects. Then, how to ensure efficient business operation? We think attention should be paid at least to the following aspects:

First, commodities should be marketable. The commodities provided for the society by the production department must meet market requirements, and the commodities purchased by the commerce department must be such that they can be sold quickly. In other words, both in the sphere of production and in the sphere of circulation, we must place the marketability of commodities in the primary position. Such is the most fundamental requirement of efficient operation. It is also dictated by the most fundamental aim of socialist production. If we want commodities to be salable, we must analyze consumer requirements from time to time, keep track of market prices and build direct links between production and sale. In this connection, Shanghai has done something. In addition to such forms of production-sale integration as factory-store links and joint industry-trade negotiations with foreign merchants, Shanghai has set up more than 500 sales departments and managers' departments of industrial enterprises. Through these "windows" social surveys are widely conducted and market information is gathered. These forms of operation played a positive part in renewing a variety of products, developing new products, improving product quality, increasing variety of colors and designs, and beautifying packing. Gratifying steps have been taken towards the salability of commodities. Persistent efforts in this direction will bring more grist to the mill of promoting business operation and developing production.

Second, do a good job of market forecasting. Forecasting means foresight. It is the precursor of efficient business operation. Any production enterprise that wants better operational results must apply scientific methods in investigating and studying the variety, quality, quantity and price of its products, find out whether its products meet market requirements, forecast the trends of change and development of various factors, and take different demands on products as the motive force for improving its business operation. The industry-commerce and industry-trade departments should coordinate with each other, correctly analyze the internal law of social requirements, feed-back the production department as the means of affecting and directing production.

Third, circulation of goods must be facilitated. This is the basic requirement of raising the level of business operation. To facilitate circulation of goods will shorten the time of circulation, cut down circulation cost, minimize wear and tear of goods, speed up fund turnover, and achieve better economic results. Since the Third Plenum of the Party, the urban and rural economy has gradually been stimulated and diverse channels of circulation have taken shape. While there are more channels of circulation now than in the past, there are still some obstructions, and some supply measures are confused. There are also speculative activities and smuggling activities carried on by some unlawful elements. For this reason, it is imperative to take measures to crack down on speculative activities, perfect different systems, continue to remove obstacles from the circulation channels, organize flow of commodities properly, cut down unnecessary circulation links, and bring the roles of various circulation departments into full play.

Fourth, serve the users and consumers. Generally speaking, whether the production department and sales deaprtments can coordinate closely, think of the interest of users and consumers thoroughly and provide them with various types of service will produce significant effect on the sales of technique-intensive, durable and high-priced goods. For instance, when making sales of electomechanical products, it is advisable to provide users with manuals, to guarantee supply of parts, to perform repair service, and to help install large sets of equipment. This should be done not only for products sold on the home market but also for goods sold on foreign market. By performing good service a broad market can be opened. Commodity propaganda and recommendation are an important link in service. New products should be publicized and recommended so that people can understand their performance, special features, effects and methods of use. Even old products should also be publicized because propaganda is the medium of commodity sale. There are many channels of propagana and recommendation, e.g., advertisement, commodity exhibition. In addition, the sales staff of the commerce department may propagate and recommend goods at their counters.

The above is only a part of business operations which are extensive in content. Various trades and industries have accumulated many experiences which should be summed up, put into practice and improved upon. In the interest of the development of socialist construction, the economic department should train a large number of managerial personnel who adhere to the socialist road, know how to operate, have specialized knowledge, an enterprising spirit and a strong sense of responsibility: this is one of the important tasks ahead of us.

GENERAL

ADAPTION OF PRODUCTION RELATIONS TO PRODUCTIVE FORCES URGED

Guangzhou GUANGZHOU RIBAO in Chinese 10 Sep 81 p 3

[Article by Song Ziho [1345 1311 0735]: "Changes in Production Relations Should Meet the Requirement of Development of Productive Forces"]

[Text] Production relations must be suited to the character of productive forces. This basic principle of historical materialism brings to light the universal law governing the development of human society. Following this principle, the "Resolution on Certain Questions in the History of the Communist Party of China" summed up the lessons and experiences of the past 32 years and pointed out: "The change and perfection of the relations of social production must be adapted to the state of productive forces and must help develop production." To comprehend this principle conscientiously and to implement it well are of momentous significance in reforming and perfecting the socialist relations of production in our country and building a modern and powerful socialist country.

The basic principle of historical materialism tells us that as a social form of production, production relations are determined by their material content, and they develop and change along with the development of productive forces. They react on productive forces, playing a part in promoting the development of productive forces when they are suited to the character of productive forces, and playing a part in hindering the development of productive forces when they are not suited to the character of productive forces. If we understand this law, we shall be able to change production relations consciously according to the requirement of the development of productive forces. But whether these changes are correct or not can be objectively judged, in the final analysis, only by whether the development of productive forces is promoted. This is to say, changes in the relations of production that promote the development of productive forces are those that are adapted to the state of productive forces and are correct; otherwise, the changes are not adapted to the state of productive forces and are wrong. Therefore, in drawing a line between right and wrong for the changes in production relations over the past 32 years, and in studying how to reform and perfect the socialist relations of production from now on, we should take as the criterion whether production relations ultimately help develop productive forces. This basic principle is adhered to in the "Resolution."

Some people think that by entering into a socialist society without passing through a capitalist society, our country has violated objective economic laws. This view ignores the objective fact that in terms of economic growth rate, over the past 32 years our country not only has far surpassed old China but also has exceeded the majority of capitalist countries. Apart from this, the view represents a simple, mechanical understanding of the role and form of objective economic laws. True, according to the general requirement that production relations must be suited to the character of productive forces, the logical order of development of human society would be from primitive society to slave society, to feudal society, to capitalist society, and then to communist society (including socialist society, its lower phase). But when it comes to a particular country or nation, this law of development has its particularity because of different historical conditions. China's democratic revolution came in the era of imperialism and proletarian revolution, and the practice of struggle proved that the capitalist road was not possible; as Comrade Mao Zedong pointed out, "Only socialism can save China." Changing from a semifeudal, semicolonial society to a socialist society through new democracy was the particular road to the social development of China. Citing massive facts, the "Resolution" proved that this change brought on the "rapid development of productive forces at a rate unknown in the old society." Apart from this, we should understand the socialist society as a process of development. As the productive forces of our country are still comparatively backward, socialist society in our country is bound to go through a stage during which it is economically imperfect and institutionally immature and imperfect; this is precisely dictated by the law that productive forces determine production relations and that production relations must be suited to the character of productive forces. The leftist errors committed in the past in changing the relations of production were precisely the result of our not recognizing this process of development and our attempting to build a perfect, mature socialist society at one stroke.

The institution of a socialist system in our country was marked by the basic consummation of the socialist transformation of agriculture, handicrafts, and capitalist industry and commerce. Through the three major transformations, production relations basically acquired the essential characteristics of a socialist society--public ownership of the means of production, and distribution according to work. This was the most profound and greatest social change in the history of our country. Practice has proved that this change has not only opened vast vistas for the rapid development of productive forces but has also avoided the temporary decline in production that is hard to avoided in every great social change. In the years of change from 1953 to 1956, gross industrial output averaged a progressive annual growth rate of 19.6 percent, and gross agricultural output a progressive annual growth rate of 4.8 percent. Economic growth was fast, and the people's living conditions improved markedly. This, of course, had much to do with the proportional and coordinated development that was determined according to plans at that time. But it was also strong proof that the guiding principle underlying the three transformations was entirely correct. For all its defects and deviations at the later stage, the epochal success of this fundamental change cannot be denied. Therefore, the "Resolution" affirmed: "In the transition period, our party creatively opened the road of socialist transformation suited to the characteristics of China."

At the same time, the "Resolution" pointed out that in changing the relations of production, we traversed a tortuous road forward, along which we committed leftist errors of rash advance and "indiscriminate approach" divorced from the level of productive forces. In 1958 the movement for universal establishment of people's communes was rashly launched, blowing the communist wind of "larger size and a higher degree of public ownership" and "egalitarianism and indiscriminate transfer" which led to the undermining of productive forces. In the early 1960's, the Party Central Committee and Comrade Mao Zedong discovered the above errors and corrected them in actual work, thus enabling industrial and agricultural production to be restored and developed quickly. Through these twists and turns, our party acquired valuable experiences in leading the socialist revolution. But liquidation of the leftist errors in guidance was not clearly proposed at the time, and the result was that the errors of rash advance and oversimplified and uniform approach subsequently were repeated when the relations of production were changed. Added to this were the disruptive activities perpetrated by the Lin Biao and Jiang Qing counterrevolutionary cliques, who criticized the previous stage's correct approach as "capitalist" and "revisionist," "forced a transition to the higher stage despite poverty: in the sphere of circulation, and practised egalitarianism in the area of distribution; all of these measures were divorced from the level of productive forces and led to another severe undermining of productive forces.

Since the Third Plenum of the 11th Party Central Committee, with past experiences and lessons learned, a policy of comprehensively restructuring the economic system step by step has been explicitly put forward. Restructuring the economic system means making adjustments to those production relations that are unsuited to the development of productive forces, so that the socialist relations of production in our country can more effectively promote the development of productive forces and give fuller play to their superiority. For example, the policy of letting diverse sectors of the economy and diversified forms of management exist side by side has brought about the restoration and development of the collective economy and individual economy in towns and cities, and various forms of economic combinations. The structure of ownership have begun to suit the state of multilevel productive forces. Experiments have been made across the country, according to plan to expand the power of enterprises to manage themselves. Enterprises have begun to change from units attached to administrative organs into vital economic cells. The system of "eating from the same big pot" is being changed. Under the guidance of state plans, attention is being given to bringing the supplementary role of market adjustment into play. The role played by the law of value in regulating production and circulation is being given importance, and the operational mechanism of the socialist economy is being improved. Various forms of the responsibility system with remuneration linked to output--forms that were initiated and perfected in agriculture--have brought the collective economy in agriculture to a new stage of development. Later, the economic responsibility system has in various forms begun to spread to various sectors of the national economy, integrating economic power and responsibility closely with their interests. An effective form of applying the principle of distribution according to work in managing socialist enterprises has been found. The central authorities are pursuing special policies and adopting flexible measures with regard to Guangdong and Fujian. Externally, economic activities are made more open; internally, policies are more relaxed; and the power to make economic decisions is delegated further to the lower levels. The two provinces are required to start off in restructuring the economic system. These momentous policy decisions to reform production relations have not only enlivened the national economy as a whole but also enabled us to see what pattern of socialist economy is best suited to the basic conditions of our country at the present stage.

However, as the "Resolution" pointed out: "There is no set pattern of development of socialist relations of production. Our task is to create, according to the requirement of the development of our productive forces, specific forms of relations of production that are suited to productive forces and are conducive to continuous progress." To strive for and create these specific forms is an important and formidable task in building a modern and powerful socialist country.

FUTURE ECONOMIC DEVELOPMENT OF GUANGZHOU

Guangzhou GUANGZHOU RIBAO in Chinese 17 Sep 81 p 1

[Article: "General Target of Economic Development Outlined at Guangzhou Party Congress"]

[Text] What is the general target of economic development of Guangzhou for the next 3 years? This was explained by Comrade Liang Lingguang [2733 7227 0342] in his work report delivered at the Guangzhou party congress. The general target is this: Comprehensively implement the eight-character policy centered on readjustment and, in particular, grasp restructuring and readjustment while continuing to readjust the proportional relations and increasing economic results. Conscientiously carry out the special policies and flexible measures, integrate "centralization" with "flexible development," integrate full application of the economic approach with the necessary administrative management and administrative intervention, and integrate the development of production with the gradual improvement of people's living conditions. Ensure that industrial and agricultural production maintain steady growth rates, and lay a strong foundation for development following the readjustment.

To ensure this target, Comrade Liang Lingguang pointed out in his report: First, it is necessary to continue to adjust rationally the structure of industries, mainly the light and textile industries. The limited financial and material resources should be used mainly for the purpose of developing production of consumer goods demanded on the market and developing light industrial and textile goods, food products, chemical and electronic products, and light industry apparatus for daily use as well as labor-intensive products like handcraft articles and clothing for tourists. The weak links like energy, transportation and building materials industries should be strengthened.

It is necessary to continue to carry out the special policies and flexible measures. This was the second point mentioned by Comrade Liang Lingguang. He said: "In order to accelerate the economic development of Guangzhou and give full play to its role as the economic center in the true sense of the word, it is imperative to exploit its superiority--proximity to Hong Kong and Macau making it convenient to bring in foreign capital and overseas Chinese capital--further emancipate our thinking, unify understanding, overcome obstacles and, on our initiative and on the principle of equality and mutual benefit, encourage investment and export. We should fully apply the powers delegated to our municipality as laid down in the Provincial Committee's 'summary of minutes' on the work of economic readjustment. All this has created excellent conditions for our economic activities with foreign countries. We should work out corresponding concrete measures in this spirit."

Comrade Liang Lingguang went on: The third point was to restructure the economic system more effectively. It is required to set clear aim of restructuring on the principle of "open external doors, relax internal policies, and delegate powers to the lower levels," and to create conditions for carrying out extensive reforms in the future. It is necessary to draw up working measures to bring the enthusiasm of all sides into full play. At the same time, it is necessary to deal with the interests of the state, enterprises, and individuals correctly and see to it that the state gets more revenues, enterprises retain more profits, and individuals get more income. The departments of industry, communications, finance-trade, capital construction, and urban construction should enthusiastically push and implement at each level the economic responsibility system (from the bureau level, to the company, enterprise, shop and team-group levels and to individuals), and develop things along the "contract line." The principle of distribution according to work should be implemented while the results of production achieved by enterprises and the amounts of profits accumulated for the state by enterprises should be integrated with the interests of units and individuals. All departments must use their brains to open all avenues for production and learn the art of earning, accumulating and using wealth.

It is necessary to reorganize enterprises, carry out technical transformations effectively and upgrade economic results. This was the fourth point mentioned by Comrade Liang Lingguang. He said: "Reorganizing enterprises is the most realistic way to tap the potential of enterprises, increase the economic results and revenues, and ease the financial difficulties."

Continuing, he set forth the specific demands at the fifth point as follows: In agriculture, it is necessary to implement further the relevant policies laid down by the central authorities and the provincial committee, to amplify and perfect the system of agricultural production responsibility, to adjust the distribution of agriculture rationally, to survey resources, to continue to stress production, and to develop economic diversification in a manner suited to local conditions so as to enable the peasants to get well-to-do early. In the case of urban counties, the policy of serving cities should be continuously implemented; simultaneously with stressing grain production, efforts should be made to step up production of meat, eggs, milk, aquatic products, fruits, and sugarcane, as well as production of native and special products, and gradually to build the suburban counties into a base of nonstaple foods and a base of raw materials for light industry. He said: "The suburbs should place vegetable production in the primary position, ensure the vegetable planting acreage, step up capital construction of vegetable plots, and make efforts to ensure 'harvest despite drought and water-logging' and 'better quality, high yield, greater variety, and balanced and early supply to market.' All the urban trades should vigorously give financial, material and technical aids to agriculture through all channels and bring about faster development of agriculture.

Talking about the specific demands at the sixth point, Comrade Liang Lingguang pointed out: "It is necessary to lay emphasis on the planned economy while giving full play to the subsidiary role of market adjustment. It is required to continue to relax policies and stimulate the economy. With public ownership occupying a predominant position, the diverse sectors of economy should be allowed to exist side by side and efforts should be made to run state-operated enterprises successfully and develop the individual economy appropriately so as to turn it into a supplement to the socialist public ownership. Individual economy should be given support politically and economically and must not be discriminated against. We should welcome all enterprises in the province and from other localities who come to Guangzhou to sell their commodities, particularly agricultural and sideline native and special products, and provide them with facilities. At the same time of stimulating the economy we should strengthen planned management and market management, exercise the administrative supervision and intervention that is necessary, and solve new problems cropping up in the process of stimulating the economy."

Finally, Comrade Liang Lingguang referred to the stabilization of market prices, saying "stabilization of market prices is an important thing bearing on the matter of ensuring the living standard of the urban people, and must be grasped seriously." "As Guangzhou is the center of trade and international intercourse with a large floating population, the gap between the volume of available commodities and the amount of money put into circulation brings the question of commodity prices into more striking relief. This is an overall and complicated question and something will have to be done by the central authorities and provincial authorities under unified arrangements, but it behooves us to assume a positive attitude, take effective measures, and strive for basic stabilization of market prices."

HONG KONG PAPERS COMMENT ON SHANDONG BANK STOCK ISSUES

HK231521 Hong Kong TA KUNG PAO in Chinese 18 Oct 81 p 3

[Article by Tien Ming [3944 2494]: "Shandong Bank Makes First Issue of Stock"]

[Text] Recently, a bank in China issued stock. This was the first time that China has issued stock in 30 years.

This bank is a branch of the Chinese Construction Bank in Yantai, Shandong Province. It issued stock in order to raise funds for constructing a local power station. The money it raised amounted to 110 million yuan (about HK$400 million).

The construction bank is one of the four main banks in China. The other three main banks are the Chinese People's Bank, the Agricultural Bank and the Bank of China. The construction bank specializes in dealing with investment in state-run and local capital construction projects. During the period of the four modernizations and the readjustment of the national economy, its main task is to administer, regulate and supervise the rational use of construction funds in various localities. In the meantime, by using usual banking business methods, it stores idle funds retained by enterprises, units and residents in the society and uses them in production and construction, where funds are urgently needed.

During the economic readjustment period over the past 2 years, the state has stipulated that some capital investment funds will still be allocated by the state, but most of them will be extended as bank loans. As a result, the construction bank is playing a greater leverage role in economic construction.

The fact that the Yantai Branch of the construction bank made its first issue of stock can be regarded as a new effort to absorb idle funds to assist with local capital construction.

In recent year, Shandong Province has scored great success in developing its industry, agriculture and economy. In particular, it has made new breakthroughs in agricultural production, such as in the production of grain and cotton and soon. This is well known throughout the country. The development of industrial and agricultural production in the Yantai area has been fairly rapid and it has now become one of the richer areas of the province. However, a severe shortage of energy has hampered its development. There is a coal min in Longkou County near Bohai

Bay, where a power station can be built. About 2 years ago, the State Planning Commission approved a plan for building Kenghou power station, with a generating capacity of 600,000 kilowatts, to solve the problem of the shortage of energy. According to plans, the power station construction project will be carried out in two phases. The investment for the first phase project will amount to 165 million yuan. About 60 million yuan will be supplied by the Ministry of Electric Power Industry and the remainder (105 million yuan) must be raised by the local government.

Under such circumstances, the construction bank has played its necessary role. After working out a plan together with the local authorities, it was decided that the branch of the bank in the Yantai area would issue stock to centralize local idle funds for local use. As a result, the subscription quota of 110 million yuan has not basically been fulfilled.

The stock is actually a fixed bond which cannot be transferred at will. There is not possibility of speculation or profiteering, but the bondholders will draw a high rate of interest. After the completion of the power station and the commencement of its first phase of operation, the bank can start repaying capital with interest. The local department concerned has estimated that the generating units, which can produce 100,000 kilowatts of electric power, may make an annual profit of 19 million yuan. In other words, capital with interest will be paid off in 5 years. Over 7 years, the amount of profit will be equal to the total amount of funds raised through the stock issue. This means another power station, which requires an investment of 160 million yuan, can be built after 7 years. Why should they not engage in such a profit-making business?

Recently the following view prevails on the mainland: now the state is poor, but local enterprises and people have become rich. At the present stage, this is actually not a bad thing. In a recently held meeting, Li Baohua, director of the Chinese People's Bank, told branch managers of the bank in various provinces and munitipalities: over the past 2 years, the national economy has been readjusted and reformed. In the preliminary distribution of national funds, the proportion of funds distributed in the financial budget has dropped, and the amount of money controlled by enterprises has increased. People in the urban and rural areas will be quite well off. This will give banks a greater chance to play their role in accumulating funds.

It is obvious that banking activities in China should be enlivened. The fact that the branch of construction bank in Yantai has made the first issue of stock is a good example.

PRC STRATEGY FOR FOREIGN TRADE DEVELOPMENT

HK220859 Hong Kong WEN WEI PO in Chinese 20 Oct 81 p 2

[Special feature by WEN WEI PO reporter Lan Ching-chung: "The Advance of China's Strategy for Foreign Trade"]

[Excerpts] There are many indications that China has made new policies from the high plane of strategy to take the initiative in establishing economic relations with foreign countries and promoting foreign trade. Such indications are extremely common such as the following ones:

Authoritative persons have proposed recently that foreign trade personnel should travel to foreign countries to do business and that foreign trade personnel should establish marketing networks in foreign countries;

At a forum of first secretaries of all provincial CCP committees held after the party's sixth plenary session, Vice Chairman Deng Xiaoping called for actively using foreign capital to quicken the pace of economic development;

A conference on special economic zones in Guangdong and Fujian provinces; which was presided over by Vice Premier Gu Mu shortly before the party's sixth plenary session, discussed special policies and flexible measures in the two provinces, changed the previous formulation of "allowing the two provinces to become prosperous first" which is of partial significance, and put forward the new formulation of "making experiments in the reform of economic systems and the exploration of new ways for development" which is of overall significance. The conference also called for "lifting more restrictions on external work, relaxing more (policy) restrictions on internal work and transferring more power to lower levels."

The total export value at last year's two Guangzhou trade fairs amounted to over $5 billion which accounted for one-third of the whole country's total export value ($18 billion). This shows that the binanual trade fair in Guangzhou is still one of China's important sites for doing export business.

BRIEFS

CHINA, ROK TRADE--Hong Kong reexports of China-origin goods to South Korea increased 118 percent or HK$97 million during the first 6 months of this year, the government announced yesterday. This substantiated earlier reports that China has been doing business with South Korea through Hong Kong as the middleman. China earlier this month admitted publicly for the first time in a report carried by GUANGZHOU RIBAO that it conducts trade with South Korea via Hong Kong. China has close links with communist North Korea and does not recognize the government in Seoul. And Chinese officials had consistently dismissed reports of trade with South Korea. Seoul businessmen estimated that China's trade with their country might reach the HK$1 billion-mark, compared to nearly HK$600 million last year. [Excerpt] [HK170112 Hong Kong STANDARD BUSINESS STANDARD in English 17 Sep 81 p 1]

CHANGING FOREIGN TRADE--["Responsible Members of State Council Talk About Speeding up the Development of China's Foreign Trade and Setting up Sales Network in Foreign Countries"--dispatch] Beijing--Recently, responsible members of the State Council talked about speeding up the development and reforming the structure of foreign trade. According to the spirit of this talk, there will be tremendous changes in the work methods and scope of the foreign trade departments. According to authoritative sources, foreign trade should not be carried out within our country alone. The Chinese export commodities fair which is held twice a year in Guangzhou is doing business from behind the counter. It is a limited form of foreign trade and, we have not gained footholds in many parts of the international market. [Text] [HK160833 Hong Kong WEN WEI PO in Chinese 16 Oct 81 p 2]

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

DIFFERENCE BETWEEN PRODUCTIVE AND NONPRODUCTIVE LABOR UNDER SOCIALIST SYSTEM

HK301400 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 9, 20 Sep 81
pp 22-29

[Article by Wang Jiye [3769 4480 2814]: "On the Difference Between Productive and Nonproductive Labor Under the Socialist System"]

[Text] The correct distinction between productive and nonproductive labor involves not only the basic principle of political economics, the scientific categorization of the structure of the national economy, the social product and the national income, but also exerts a direct impact on the indicator system of planning and statistics. In the last 6 months, a number of articles have been published in succession in the newspapers and periodicals, presenting discussions on this topic and airing opinions different from those in the past. Some comrades maintain that socialist productive labor comprises that which is undertaken under the socialist production system without exploitation and for the purpose of satisfying the physical and cultural needs of the society. Socialist productive labor is not confined to the production of materials only. It includes both physical labor and mental labor, with those in physical material production satisfying the needs of material life and those in nonmaterial production satisfying the needs of cultural life. National income comes from both the material production realm and the nonproductive realm.

Those comrades who take the above viewpoint also maintain that the theory claiming that under the socialist system productive labor comprises only the production of physical materials do not follow the Marxist doctrine of productive and nonproductive labor, nor is our present distinction between productive and nonproductive labor and the computation of national income in conformity with the original intention of Marx both in the sense of extension and intension. They come to the conclusion that our negligence of commerce, the service trades, science, education and cultural work as well as the refusal to accept those who work in these areas as part of the working class for a long time in the past was the negative outcome of the incorrect distinction between productive and nonproductive labor.

This being so, it is quite necessary for us to clarify what is right and what is wrong in theory through discussion and make a correct distinction between productive and nonproductive labor, if we are to persist in the economic doctrine of Marxism and to expedite the healthy development of our economic construction.

Three Difficult Points

To distinguish between productive and nonproductive labor, we have to trace back to Marx's theory about productive and nonproductive labor under the capitalist system. This has been a theoretical issue for a long long time, and I think that this is quite a difficult problem in political economics. By and large, three aspects may be mentioned in this regard:

First, in the understanding of some comrades, it was Marx's viewpoint that what comprised productive labor covered more than that of the workers who created surplus value in the field of material production, as all labor that provided capitalists with profit (including labor in the nonproductive field) was considered as productive. For example, the labor of singers, dancing girls, actors, and so on, just as the labor that produces material products and creates surplus labor, would also be productive labor. Then, arises the problem: While Marx mentioned more than once in his book "Das Kapital" that productive labor was that which created surplus labor in the process of capitalist production (material production), why did he again devote considerable space in his book the "Theory of Surplus Value" to explain that all labor that provided the capitalists with profits would be productive labor?

Second, in the discussions many comrades quoted Marx's comment on the first definition of productive labor formulated by Adam Smith as the ground for their argument. To be specific, in what sense exactly did Marx endorse or approve the first definition of productive labor formulated by Adam Smith? To put it briefly, Smith's first definition meant the following: Labor expended in exchange for capital constituted productive labor, while that expended in exchange for income constituted nonproductive labor. Since the labor that is exchanged for capital is integrated into capital itself, the integrated labor becomes part of capital, not only replenishing the laborer's value of consumption, but also providing a certain amount of surplus value. For this reason, it is productive. On the other hand, since the labor that is exchanged for income does not constitute a capital forming factor, it is unable to provide the capitalists with a surplus. Hence, its nonproductivity. Then, can it be understood that Marx's endoresement or approval of Adam Smith's first definition of productive labor could mean the definition became Marx's own definition?

Third, does the word production in the phrase productive labor have the same meaning or some different meaning when compared with the word production in the phrase the sphere of material production? The Chinese version of the "Collected Works of Marx and Engels" published in our country was retranslated from the Russian version of the works, in which it can be found that the two words "production" in Russian are two different words. The former means effectiveness brought about by production, a synonym for labor productivity. It seems that this word should be translated as labor of a productive nature. The latter means material production, bearing the same meaning as the word production in the process of production. In the Russian version, the two words cannot be used interchangeably, while in the Chinese version the two words have been translated the same. This causes a lot of trouble in the discussions on productive labor and the limit of the sphere of material production. Then, can it be said that the size of the sphere of socialist productive labor coincides with that of its corresponding sphere of material production? In the case of productive labor which corresponds to the sphere of material production, is it to be understood as productive labor as dictated by the material conditions of labor or is it to be understood as productive labor as dictated by the social conditions (production relations) of labor?

The above-mentioned three problems constitute the crux of our current discussion on productive and nonproductive labor. If we bypass these problems, it seems that no satisfactory or convincing conclusion can be drawn from any postulations.

General Productive Labor and Special Productive Labor

Let us investigate the problem from the facet of the mutual relations between general productive labor and special productive labor.

Labor is a process. First of all, labor represents a relation between mankind and nature. This is to say, through its own activities, mankind regulates and controls the material mutation between mankind and nature. To get the expected results from the labor process, there must be the simple or most essential elements. They are purposeful activities or labor itself, the subject of labor and the means (or instruments) of labor. This is seen from the viewpoint of the labor process. Seen as the results of labor, or investigated from the angle of labor products, the means of labor and subject of labor are manifested as means of production, and labor itself is manifested as productive labor. In this way, it can be said that the labor which produces products is productive labor, and its corresponding labor process is a productive process. If the result of the labor process is not a product with use value but a waste product, even with the completion of the labor process, the labor so expended does not constitute productive labor, nor can the corresponding labor process be deemed as a productive process. Whether labor can be manifested as productive labor depends on three things: (1) It cannot be separated from the labor process; (2) it cannot be separated from the simple elements of the labor process; (3) it cannot be separated from the labor product. This kind of productive labor never alters with the mutation of various social economic modes, because labor like this is an extension of the material property of labor rather than that of the social property of labor. "In terms of the labor process itself, only labor with a product (namely a material product, as only material wealth is involved here) can be productive." (Marx: "The Result of the Direct Production Process," People's Publishing House, 1964, p 114) We can [call] such labor productive labor in general or general productive labor.

General productive labor varies in form under different social systems. As for productive labor with a special form, we call it special productive labor. In capital production, how is general productive labor manifested as special productive labor? As far as capitalist production is concerned, the deciding factor of the mutation from general productive labor to special productive labor is the creation of surplus value, since the search for surplus value is the goal of capitalist production. In this sense, only the labor that creates surplus value is productive labor, and the creation of surplus value is carried out in the sphere of material production. Under the capitalist system, productive labor is the labor that creates surplus value in the process of the production of material products.

Given the general productive labor manifesting itself as the labor that creates surplus value in the process of material production, namely, special productive labor, does it also manifest itself as the wage labor in the nonproductive sector that provides the capitalist with profits? This would involve the question--in what sense did Marx approve of Adam Smith's first definition of productive labor.

Adam Smith wrote: "For certain labor, when it is applied to a subject, it adds value to that subject. This does not work for other kinds of labor. The former is called productive labor, as it creates value; while the latter is called nonproductive labor." (Quoted by Marx in his work "The Theory of Surplus Value," "Collected Works of Marx and Engels" Vol 26, I, p 146) Regarding this, Marx commented: "Productive labor is such that it creates surplus value--its owner's profit--in addition to the reproduction of its own (the wage laborer's) living expenses." (Marx: "The Theory of Surplus Value," "Collected Works of Marx and Engels" Vol 26, I, pp 146, 148, 142 and 143) Marx further pointed out: "In a definition prescribed for productive labor from the point of view of capitalism, Adam Smith has touched on the essence of the problem and grasped the main points. One of his great scientific contributions (just as Malthus correctly points out that Smith's distinction between productive and nonproductive labor still constitutes the foundation of the whole bourgeois political economy) lies in the fact that he was the first one to formulate the definition that productive labor is labor that is exchanged directly for capital." (Ibid)

A correct understanding of this comment made by Marx is extremely important. The reason is that the labor which is exchanged for capital includes not only wage labor that engages in material production, but also that which belongs to the nonproductive category. Smith was of the opinion that both were productive labor and Marx agreed. Does this imply that Marx's doctrine of productive labor under the capitalist system is a simple repetition of Smith's first definition of productive labor? This definition is considered to be the foundation of the whole bourgeois political economy. How can this be understood? In my opinion, the theme which equates Smith's first definition of productive labor with Marx's contention is quite debatable. When Marx went on commeting on Smith's first definition of productive labor, he quickly made another comment: "Here, the distinction between productive and nonproductive labor is made from the point of view of the money holders, the capitalists, and not from the point of view of laborers." (Marx: "Theory of Surplus Value," "Collected Works of Marx and Engels," Vol 26, I, pp 146, 148, 142 and 143) How should this be explained? My understanding of this is as follows: Marx's approval of Smith's first definition of productive labor must be taken into consideration in comparison with Smith's second definition (productive labor is the labor that has been embodied in commodities.) The definition which Marx agreed upon reflects the viewpoint of the money holders, or the capitalists.

What then were the viewpoints of Marx regarding reproductive labor under the capitalist system?

Marx said: "In the sense of capitalist production, productive labor is a kind of wage labor which is exchanged for the variable part of capital (the part of capital which is expended for wages) and which is not only capable of reproducing this part of the capital (the equivalent of the costs of the laborer's own labor power), but also creates surplus value for the capitalists in addition. Through this and this alone are commodities and money transferred into capital, enabling capital to be produced." (Ibid)

Some articles maintain that this passage may not be entirely the same as the original quotation of Adam Smith's, but is a restatement of Adam Smith's idea by Marx. I don't think this is true either. Leaving aside for the moment the concepts used in the passage (for example, variable capital and surplus value) which could not possibly be used by Smith, what is more important is that what is referred to here as "creating surplus value for the capitalists" means the creation of surplus value created by the wage laborers in the material production sphere without any indication of the implication that laborers in the nonproductive sphere also create surplus value. Marx resumed his comment immediately by pointing out that the existence of the capitalist class is built upon its corresponding rate of production, or in Marx's own words, "the workers not only replenish the original value, but create new value. The labor time which is embodied in the commodities is more than that embodied in those products required for the subsistence of the workers. This wage labor of production is the very foundation of the existence of capital." (Ibid)

Therefore, I believe that when Marx said that productive labor in the capitalist sense is that which creates surplus value, he meant the labor of those who engaged themselves in material production, excluding the labor of those who worked in the nonproductive sphere.

Some comrades pointed out that in the days of Marx, capitalist scientific research, culture, art, education, sanitation and other related nonmaterial production sectors were still very much undeveloped. Just as Marx himself had pointed out, all these manifestations of capitalist production in the aforesaid sectors, compared with these of the entire production, would have been quite negligible, and therefore could be ignored. If Marx had witnessed the reality of today, he would not have made such a comment as "not to be mindful of them." At first sight, this seems to be an important point, but on second thought, with careful analysis this point is also open to question. Indeed, Marx did once say: "Such labor in comparison with the volume of capitalist production is minimal approaching zero...Therefore, it is permissible to be not mindful of them." However, Marx immediately added: "This labor can only be discussed when it is in the form of wage labor, without being productive labor at the same time, and when it falls into the category of wage labor without being productive labor at the same time." (Marx: "The Outcome of the Direct Production Process" pp 112, 105) Under the capitalist system, not all wage labor is productive labor, even though all productive labor is wage labor. From the above exposition by Marx, no conclusion can be drawn to the effect that this labor is productive labor. In view of the actual situation, these sectors take up a considerable percentage of the capitalist national economies, exerting important influence over the development of material production. If we regard this labor as productive labor on these grounds, the conclusion would be quite doubtful too. The percentage growth of these sectors in the national economy does not indicate that the labor concerned has undergone a change, a transformation from nonproductive labor to productive labor.

Under the capitalist system, the reason why labor in these sectors is regarded as productive labor is merely that part of the productive labor takes a distorted form, namely wage labor producing no surplus value takes the appearance of producing surplus labor. For example, in the case of a theatrical company owned by a capitalist, the wage labor of the actors brings profit to the capitalist. To the capitalist, such labor is productive. However, in terms of form of value, the total income of this theatrical company is transferred from the value created by workers in the material production sectors. In terms of physical form, the wear and tear of the physical assets used by this theatrical company are also replenished by the products of the material production sectors. It can be obviously seen that the taking on of the appearance of redistributing surplus value in the nonproduction areas is only a phenomenon which is more illusory.

As demonstrated above, under the capitalist system the general productive labor is manifested as special productive labor as well as the labor creating surplus value. "Only the labor that directly creates surplus value can be productive labor, and only those who expend labor that directly creates surplus value can be productive workers. In other words, productive labor can only be that which is expended directly for the purpose of multiplying value for capital in the process of production." (Marx: "The Outcome of the Direct Production Process," pp 112, 105) However, this special productive labor cannot exist in the absence of general productive labor, as the former is only a form of manifestation of the latter. It is exactly in this sense that Marx said: "The capitalist labor process just cannot eliminate the general property of the labor process." (Ibid)

Productive Labor Under the Socialist System

It is my belief that first of all we should take into consideration the relationship between general productive labor and special productive labor, when we discuss the transformation of general productive labor into special productive labor under the socialist system. As to the problem of distinguishing the material production areas and the nonproductive areas, this is the problem to be studied next. Then, how is general productive labor manifested as special productive labor?

Marx said: "Suppose no capital exists and workers receive their own surplus labor with the result that the value they create would exceed what they consume. It is only in such a situation that labor is truly creative. That is to say, new value is created." (Marx: "The Theory of Surplus Value," "Complete Works of Marx and Engels," Vol 26, I, p 143) This assertion of Marx provides us with a clue for the study of productive labor under the socialist system.

First, the individual economy still exists in socialist society. The labor of the self-employed laborer, viewed from the angle of general productive labor, is productive labor; while viewed from the angle of special productive labor, it is not. It is a transitional form heading for socialist productive labor. When we speak of it as socialist productive labor, we are referring to the transitional property of such labor.

Second, the labor that produces the commodities for the necessary labor, viewed from the angle of general productive labor, is also productive labor, because it creates the physical commodities and value needed by the laborers (workers) for their means of subsistence. Viewed from the angle of special productive labor, it is again not productive, because it is unable to satisfy the growing needs of the laborers and provide them with the needed material products for their material and cultural life. When we speak of it as socialist productive labor, we are referring to it only in the sense that it satisfies the daily necessities of life of the laborers, rather than taking it as productive labor in the sense that it satisfies the growing material and cultural needs of the laborers' life.

Third, in terms of the social property of productive labor, in the sense that general productive labor is manifested as special productive labor, I believe that under the socialist system productive labor is that which produces surplus products. Labor that produces surplus products is labor that satisfies the growing material and cultural needs of the society. However, the reverse is not true. It cannot be said that all labor that satisfies such needs is productive labor, because the latter includes not only the labor that creates surplus products, but also that which belongs to the nonproductive area producing no surplus products. To take the labor that satisfies the growing material and cultural needs of the society as productive labor necessarily gives rise to various queries.

If we take all labor that satisfies the needs of the society to be socialist productive labor, then with the extermination of the exploiting class in our country, what labor is there that does not satisfy the needs of society? Even the labor of those who are in government service exists for the satisfaction of the needs of the society. Without their labor, the life of the society would be thrown into chaos, socialist construction would be stopped, and the needs of the society would be left unfulfilled. It is quite obvious that to define productive labor in terms of the concept of satisfying social needs actually is equating social labor with productive labor.

If we accept the assumption that socialist productive labor includes both the labor that produces material products services, then it naturally follows that both of them should be able to furnish surplus products. Actually, however, the non-productive labor that satisfies the needs of society does not furnish surplus products. In furnishing services, definitely there would be wear and tear of fixed assets and consumption of fuel, and so on, and these will be replenished by products produced by the material production sector. Indeed, the service sector has its own monetary income and management expenses, but they are the results of the redistribution of national income created by the material production sector.

As to the division of the material production sector and the nonproductive sector in comparison with the distinction between the productive and nonproductive labor in terms of social properties, they are problems of different levels. The social property of productive labor, or special productive labor, is not suitable for dividing the material production sector and the nonproductive sector. It is the material property of productive labor, or general productive labor, which comprises the basic ground for dividing the material production sector and the nonproductive sector. In terms of economic work, the concept of socialist productive labor is more suitable for research work and for indicating labor productivity and the economic effectiveness of other areas, while the concept of general productive labor is suitable for dividing up the material production sector and the non-productive sector. In the total material output are included not only the material products of those laborers who are capable of producing surplus products, but also the material products of those laborers who do not produce surplus products (for example, the products of the enterprises that fail to make a profit or incur losses). Besides, in the total material output is also included the products of the laborers who operate under nonsocialist production relations (for example, the products of self-employed laborers, the products of household sidelines in the countryside, and so on). If a comparison is made of the distinction between productive and nonproductive labor and the division of the material producing sector and the nonproductive sector, it can be said that the delineation of the material producing sector, comparatively speaking, is more in direct contact with general productive labor. Therefore, it is of special importance to investigate the division of the material production sector and the nonproductive sector under the socialist system.

The Material Production Sector and the Nonproductive Sector

In terms of the properties of general productive labor, what departments should fall into the material production sector, and what departments should fall into the nonproductive sector? I propose to discuss four aspects of this problem:

Judged from the angle of whether or not material products are produced, those that are capable of producing material products fall into the material production sector, while those that do not produce such products fall into the nonproductive sector. Communications, transportation, posts and telecommunications, commerce, material supplies and sales as well as other departments are the extension of material production in the process of circulation. Even though they do not produce materail products directly, nevertheless they comprise the indispensable link in effecting consumption of the material products (consumption for production as well as for daily life). Without this link, it is impossible for the material products created in the direct production process to be materialized as use value and value.

Viewed in terms of the nature of consumption, the consumption in the area of material production is productive consumption, as the consumed material wealth is incorporated into the use value of the product. While the incorporated value of material wealth is transferred to the new product, the consumed living labor also creates value. The labor consumed in the nonproductive area is also consumption (for example, the consumption of mental power, physical power, fixed assets, energy, and so on), but it does not form material products. This kind of labor consumption cannot be embodied into the material product. Therefore, it is nonproductive consumption.

Viewed in the light of consumption replenishment, the material consumption in the area of material production is to be replenished by new products of its own area, or to be compensated by the production compensation fund. In the nonproductive area, the material and labor consumed are to be replenished by surplus products furnished by the productive areas.

In terms of the products of consumption, the products of the area of material production are newly produced material wealth, while the results of consumption in the nonproductive area are the new needs for material wealth.

The above are the main indicators for dividing the material production area and the nonproductive area. Here, we may as well mention another problem. In some economic statistics work, instead of dividing the whole national economy into a material production area and a nonproductive area, it is divided into a material production area and a nonmaterial production area. The concept of nonmaterial production area used here is by no means exact and unambiguous. It may give the reader the following impression: In the light of the national economy as a whole, all labor is productive and falls into the area of production. The difference is that one category produces material products while the other category produces nonmaterial products. For this reason, I suggest that the concept of the nonmaterial production area should be nullified and in its place the concept of a nonproductive area should be used in order to prevent misunderstanding.

With reference to the division of the material production area and the nonproductive area, disputes arise more from the problem of setting boundaries for the nonproductive area. In the broadest sense, it can be said that the nonproductive area comprises the service sector. In the relatively narrow sense, the service sector refers mainly to the sector of services for people's daily life. The main feature of the service sector is its provision of use value. In actual economic life, service activities are multifarious. Conceptually, service is a complex notion. Consequently, it is necessary to make a concrete analysis regarding the contents and features of labor devoted to services.

First, the department in direct service of production. For example, in the broad sense, the maintenance of the means of production (fixed assets) should also fall into this category. In essence, it is an activity relating to material production, and should be included in the department of material production.

Second, the trades offering services to people's daily life with business income. Let us take for example the repair trade for consumer goods. At first sight, it seems that this trade should fall into the category of material production on account of the fact that it restores the use-value of durable consumer goods with the nature of industrial operation. It also provides income for the laborers in this trade. On second thought, however, the materials consumed by the repair service trade are furnished by the laborers of the material production sector. The income in this trade is just a redistribution of national income created by the laborers of the material production sector. Moreover, the repair of consumer goods takes place only after they are transferred from the material production sector to the consumption sector where with a lapse of time they are worn down by wear and tear. On account of this, to include the repair service for consumer goods in the material production sector awaits further consideration. The same situation exists in other service trades, such as barber shops.

Third, the service departments which serve the reproduction of labor such as education, health, and so on, should not be included in the material production section. The labor of the laborers of these departments, important as it is, nevertheless does not act on the subject of labor in the material production process, nor does not create any material products which exist by themselves separate from human laborers. It is exactly for this reason that education, health, and certain other departments have no source of direct compensation funds for the materials and labor they consume, nor the corresponding material products for the compensation funds. Marx said: "The labor of doctors and teachers does not directly create the funds out of which payments are made for their remuneration, even though the injection of their labor would mean production expenses which generally comprise the funds by which all value is created, or to put it in a different way, the production expenses which are added to labor power." (Marx: "Theory of Surplus Value," "Collected Works of Marx and Engels, Vol 26, I, pp 159-160) Some comrades not only regard the labor of teachers that transfers knowledge as productive labor, but also think that those who are educated, by virtue of the fact that they receive education and training coupled with independent deliberation and studying, also exert labor which should be classified as productive labor. I don't think this is appropriate.

Fourth, the cultural and arts sector. Certain parts of this sector do not turn out products (for example, dancing and acting); these should be included in the nonproductive sector. Other parts do provide material products (for example, the publishing houses, the motion picture industry, and so on). These should be included in the material productive sector.

Fifth, the science and research department. Science and research, including technology, do perform important functions. With the exception of science and technology that act directly or indirectly on the production elements, the other science and research departments are not productive departments. This is because their labor results do not constitute the actual productive force in direct form. It takes a transitional process for them to combine with the production elements and play their role in promoting production. Through raising the technological level of the laborers, improving the instruments of labor or improving their efficiency, and providing high quality or new subjects of labor, science and technology play their role of promoting labor force.

As this is a relatively more controversial problem, eliciting different understandings of Marx's exposition, I think it is quite necessary to interpret the following passage by Marx.

Marx made the following comment on productive labor in the capitalist sense: "It is from the direct product of an individual producer that a product is transformed into a social product, and the common product of all the workers or the combined laboring members. The various individuals of the total of workers directly or indirectly, in the relative sense, work on the subject of labor. Therefore, with development of the cooperative nature of the labor process itself, productive labor and its bearer--the productive worker—as a concept necessarily become wider in scope." (Marx: "Das Kapital" Vol 1, People's Press Publishing House, 1975, p 556) Various labor power "takes part directly in very diverse forms in the process of commodity formation or product formation (here, the process of product formation is more nicely put): some work mainly with their hands, some work mainly with their brains, some work as managers, engineers, technicians, and so on, some work as supervisors and some work as manual laborers doing simple and rough work. As a result, more and more functions of labor power are included directly in the concept of productive labor." (Marx: "The Outcome of the Direct Production Process" pp 106-107) "It is of no relevance whether the function of an individual laborer in his capacity as a simple member of the total laboring class is very close to or far removed from plain manual labor." (Ibid)

The following is my crude understanding of Marx's exposition. In regard to whether or not the labor of a mental worker can become productive labor, first of all we should note whether or not it exerts indirect action on the subject of labor (the most important factor). Second, we should note whether or not is participates in the process of product formation. Third, in the case of indirect action on the subject of labor, or in the case where the function of a mental worker is far removed from rather than close to that of manual labor, no inference should be drawn that "we should begin with the workers who act directly on the subject of labor and then extend outward layer by layer to the remote area." If deductions along this line are continued, the dividing line between "direct" and "indirect" will be blurred, and the sequence would be "direct," "indirect," and further "indirect" heading for infinity with the result of making the total social labor productive labor.

Leaving out the capitalistic nature of productive labor, the exposition of laborers in totality by Marx as mentioned above also applies to the socialist production process. The labor of mental workers can become productive labor, only when it is applied indirectly to the subject of labor (extending layer by layer to the remote area makes no sense). The examples quoted by Marx in regard to capitalist productive labor were workshops. In the socialist economy, should this scope be extended? And to what extent? This is a question worth discussing. My preliminary conclusion is that it can be extended to the range of integrated enterprises and specialized corporations, provided that these corporations are those which function as organizers of production rather than being merely administrative or general economic management entities. As for the labor of those who work in science and research institutions and economic management departments, it should not be regarded as productive labor.

Sixth, the government organizations (including economic management departments). They exercise the function of organizing social production. However, they do not create material wealth. What they do is to formulate the plans and programs of social and economic life, and to accumulate such experiences. In this respect, they are similar to those departments that supply cultural wealth.

What is still left untouched is the rather difficult department of finance. Its labor deals with the management of monetary funds and the promotion of coordinated development of the various sectors of the national economy through bank credit in incessant circulation. A part of the activities of this department are credits in the service of production. The other parts are in the service of nonproductive activities (for example, the work on savings deposits). The former activities are similar to productive labor. When Marx analyzed the general process of capitalist production, he included money capital and commercial capital (commodity capital) in the distribution of surplus value in the process of material production due to the fact that the movement of capital invariably takes the form of money capital, production capital and commodity capital in succession.

I have made a preliminary probe, as shown above, into the question of the distinction between productive labor and nonproductive labor as well as the question of division of the material production sector and the nonproductive sector. Inappropriateness being hard to avoid, I welcome criticism and correction from my fellow comrades.

LAW OF SUPPLY, DEMAND DISCUSSED

HK020539 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 9, 20 Sep 81 pp 30-37

[Article by Lin Wenyi [2651 2429 4135] and Jia Liran [6328 1462 6245]: "On the Law of Supply and Demand and Its Role in the Socialist Economy"]

[Text] In the recent study of the theory about regulating the socialist economy, we neglected the study of the law of supply and demand, which is peculiar to the realm of circulation of commodities in the market. In discussing the basis of regulation by market mechanism, people generally summed it up as taking the law of value as the basis of regulation. We believe that this is a major defect. We will present our views on this question in this article.

I. The Content of the Law of Supply and Demand and the Relationship of This Law With, and Its Differences From, the Law of Value

What is the law of supply and demand? Some comrades hold that it is a law concerning the equilibrium between the supply of and demand for commodities. Some other comrades hold that it governs the necessity for the supply of commodities to be compatible with the demand. A third group of comrades say that it governs the development from disequilibrium to equilibrium and again to disequilibrium in the supply of and demand for commodities. We think none of these are proper descriptions of the law of supply and demand, because they present it as a law concerning the relationship between the supply of and demand for commodities or concerning the movement of the contradiction between supply and demand, instead of one governing the relationship between supply and demand on one hand and price on the other as well as changes in supply, demand and price. It is incorrect to consider the equilibrium between the supply of and demand for commodities as a law, because equilibrium is only one form of existence of the contradiction between supply and demand, just as disequilibrium between supply and demand is the other form of existence of this contradiction. In the movement of this contradiction, the existence of equilibrium is relative, whereas the existence of disequilibrium is absolute, though in specific forms disequilibrium may appear as supply exceeding demand or the other way round. The change from equilibrium to disequilibrium and vice versa represent two tendencies in the movement and change of the contradiction between supply and demand. Therefore, we must not regard the regular tendency of the maintenance of equilibrium as a law, because the change from equilibrium to disequilibrium is also a regular tendency. Marx said: "The regular tendency of the maintenance of equilibrium is only a counteraction to the constant disruption of such equilibrium." (Marx: "Das Kapital," Vol 1, People's Publishing House 1975 edition, p 394; same edition in further quotations) It is also incorrect to consider the necessity for the supply of a commodity to be compatible with the demand as a law, because considering the contradiction between supply and demand, the relationship between supply and demand is one of the unity of opposites. Supply and demand are both interdependent and relatively independent; they are both compatible with each other in a certain sense and incompatible with each other in another. Considering their compatibility with each other, supply not only closely follows demand, but also imposes a forceful constraint on demand; and on the other hand, demand not only helps determine supply, but also accommodates itself to supply. Therefore, supply and demand must be compatible with each other, and we must not only require supply to be compatible with demand. Whether we are talking about supply making itself compatible with demand or vice versa, these help constitute the substance of the relationship between supply and demand, as does the deviation of supply and demand from each other, and therefore cannot be said to constitute a law. As for the law concerning the change from disequilibrium to equilibrium and then again to disequilibrium, it concerns the contradiction between production and consumption as well as the reflection of this contradiction in the market. Therefore, the law governing the movement of the contradiction between the supply of and demand for commodities is not tantamount to the law of supply and demand.

What then is the law of supply and demand? We hold that it is the law governing how to change in the supply of or demand for a commodity and a change in the price of the commodity interact on, affect and determine each other. In other words, it is a law concerning how a change in supply or demand and a change in price serve as the cause and also the effect of each other. This is a law peculiar to the study of the circulation of commodities. At all times and in all countries, so long as commodity economy exists, changes in the supply of and demand for commodities as well as price changes do objectively exist and they appear as the cause and also the effect of each other; that is, changes in supply and demand will cause price changes, and conversely price changes will induce changes in supply and demand. The following is the main substance of this objective law.

1. A change in supply or demand will cause a price change. This finds expression in this form: prices will rise if supply falls short of demand and fall if supply exceeds demand.

2. A price change will induce a change in supply and demand. A price change cannot determine the total quantities of commodities supplied and the total quantities demanded. However, it can determine changes in the supply of and demand for some individual commodities. Marx said: "If supply and demand determine market price, then on the other hand, market price...in turn determines supply and demand." (Marx: "Das Kapital," Vol 3, p 213) This is manifested in the following way: "When a price rises, the immediate consequence is that a larger quantity of the commodity under consideration will be offered for sale

in the market, so that the quantity supplied will increase (for example, some products produced by producers for their own consumption will be converted into commodities); while the quantity demanded will decrease (because people's purchasing power is limited). The indirect consequence is that for one thing, because the price is higher, producers find it more profitable to produce the commodity under consideration, so that development in the production of that commodity is promoted, and this leads to an increase in the quantity supplied. For another thing, the decrease in quantity demanded help limit the production of those products which need that commodity as a means of production. Marx said: "The prices of the means of production which are converted into a commodity supplied determine the demand for these means of production, and hence determine the supply of that commodity... The price of cotton is of decisive importance to the supply of cotton fabric." (Ibid, p 213) When a price falls, the immediate and indirect consequences which affect supply and demand will be the opposite to those just mentioned.

3. A change in supply or demand and a change in price go in opposite directions and form a cycle. Specifically, when the supply of a commodity falls short of the demand, its price will rise. A price rise will cause an increase in the quantity supplied and a decrease in the quantity demanded, so that the shortage of supply in relation to demand will give way to an equilibrium between supply and demand. Moreover, if the price continues to rise, the supply will exceed demand. Then, the price will fall, causing a decrease in the quantity supplied and an increase in the quantity demanded, so that the excess of supply over demand will give way to equilibrium between supply and demand. Moreover, when the price continues to fall, supply will fall short of demand. These changes will recur, resulting in continuous cycles.

The roles of both the law of supply and demand and the law of value are closely related to price changes. If so, what are the differences and relations between these two laws?

Over many years in the past, some comrades have been confusing the role of the law of value with the role of prices, erroneously regarding the role of the law of supply and demand as being tantamount to the role of the law of value. This is precisely the cause of errors in understanding this problem.

The law of value is the basic law governing commodity economy. The objective requirement of this law is that commodities must be exchanged on the basis of their values because their values are determined by the necessary social labor time used in their production. Price is value in monetary form. Because the law of value requires the exchange of commodities to follow the principle of exchange at equal value, price must be compatible with the value it represents. Value is the basis on which price is formed; it determines price. That is, commodities of high value command high prices, and vice versa. Prices rise and fall with value; prices must change with value. Price changes must be centered round value as the core.

However, in actual buying and selling value may not always be consistent with price. Price may be compatible with value or may deviate from it, because the formation of a price not only takes value as the basis, but also takes supply and demand as a condition. When supply falls short of demand, price will be higher than value. When supply exceeds demand, price will be lower than value. The supply of a commodity and the demand for it must be in equilibrium if price is to be compatible with value.

Because the deviation of price from value and the attainment of consistency by price and value depend on changes in supply or demand, the observation of the law of value is closely related to the role of the law of supply and demand, because when an equilibrium gives way to disequilibrium, the price will rise above value if supply falls short of demand or fall below value if supply exceeds demand, and conversely, when an excess of demand over supply or an excess of supply over demand gives way to an equilibrium between supply and demand, the price will proceed from a level that is higher or lower than value to a level that is consistent with value. Thus, the movement of price away from or toward value reflects the role of the law of supply and demand. This role is precisely the condition for the realization of the requirement of the law of value. This law requires that price must be compatible with value. Such compatibility requires that supply and demand must be in equilibrium. However, very often, equilibrium cannot be attained. Therefore, the requirement of the law of value can be realized only through upward or downward price movements in the long run and over the whole of society, movements in which price rises above or falls below value. Specifically, by virtue of the role of the law of supply and demand, that part of price in excess of value offsets the gap by which price falls short of value in upward and downward price movements induced by changes in supply and demand. Therefore, in the long run, or considering society as a whole, the overall level of commodity prices is equal to the overall level of value. Engels said: "Only by virtue of fluctuations caused by competition and consequently by virtue of fluctuations in commodity prices, can the law of value that governs the production of commodities be implemented, and can the determination of commodities' values by the necessary social labor time be realized." (Engels: "Preface to the German edition of "The Poverty of Philosophy," in "Collected Works of Marx and Engels," Vol 21, p 215)

The roles of the law of value and of the law of supply and demand are interrelated and also differ from each other. The role of the law of value is that value determines price and is the basis on which price is formed. The level of value determines the level of price, but does not regulate it in such a way as to make price higher or lower than value. Such regulation depends on the role of the law of supply and demand. Therefore, we must not equate price changes with the role of the law of value or confuse the role of price with the role of the law of value. Price changes can be a reflection of the role of the law of value and can also be a reflection of the role of the law of supply and demand. Considering the former, if a commodity's value increases, its price will correspondingly rise, and vice versa. Considering the latter, if supply falls short of demand, the price will rise; and if supply exceeds demand, the price will fall. Therefore, the regulation of production and circulation by price cannot be attributed solely to the role of the law of value. It is possible for the law of supply and demand to play a role, and for both laws to play their roles simultaneously. Moreover, under general conditions, changes in value are relatively stable, while changes in supply and demand are much more frequent and induce much more sensitive price changes. Understanding this point is of great significance in applying the law of value and the law of supply and demand under socialist conditions, to setting prices, to satisfactorily controlling prices and to doing a good job of regulation by market mechanism.

II. The Question of Whether the Law of Supply and Demand Plays a Regulatory Role in Socialist Economy

For many years, some comrades have been denying that the law of supply and demand can play a regulatory role in socialist economy. They regard the role of the law of supply and demand in regulating an economy as peculiar to capitalist society only, and hold that the law of supply and demand plays a role in regulating the distribution of social labor only in a capitalist society. As one turns pale at the mention of a tiger, some comrades, on hearing that the law of supply and demand also plays a role in regulating the economy under socialist conditions, think that this will inevitably lead to capitalist restoration.

Actually, this is a total misunderstanding. The law of supply and demand is not peculiar to the capitalist economy, but is common to all commodity economies. It existed even before the existence of the capitalist economy. Even then, people could discern the law of supply and demand through numerous market phenomena. For example, in our country, the "Collected Biographies Concerning the Accumulation of Wealth" in the "Historical Records" mentions how Ji Ran, the commercial theorist in ancient China, analyzed the relationship between supply and demand on one hand and price on the other under the conditions of a simple commodity economy. He said: "We can know whether goods are cheap or expensive by studying whether there is a surplus or shortage." He also said: "When goods continue to become more expensive, they will eventually reach an upper limit and then become cheaper again. When goods continue to become cheaper, they will reach a lower limit and then become more expensive again." In a capitalist society, price changes have become the capitalists' "barometer" for knowing the ratio between supply and demand, and become the basis on which they plan for the readjust production. The basic economic law of capitalism governs the entire economy, but the proportions according to which the means of production and the labor forces are distributed among various sectors are formed under the regulation of the law of supply and demand.

Socialist society is established on the basis of public ownership of the means of production. Therefore, it is possible to comply with the requirements of the basic economic law of socialism and the law of the planned and proportionate development of the national economy and thus to organize the economy, to consciously overcome disequilibrium, to organize a new equilibrium, to establish and maintain a rational ratio between supply and demand, and to strive for price stability. Therefore, changes in market supply, demand and price will not be so drastic and frequent as in capitalist society. Moreover, in socialist society, the fundamental interests of producers of commodities and people engaged in the distribution of commodities coincide, and there is no intense life-and-death competition, marked by each trying to cheat and outwit the other, which is characteristic of the capitalist society. Therefore, the role of the law of supply and demand is limited to various degrees. However, in socialist society, the production and exchange of commodities and also the market still exist. Therefore, the law of supply and demand will inevitably play a role. It will inevitably regulate circulation, and hence production and the distribution of social labor, through changes in supply, demand and price. This regulatory role manifests itself not only in the urban and rural markets in agricultural products, which people often talk about, but also in the market within the economy governed by the system of socialist public ownership.

The market within the socialist economy has the market that is subject to planning as its core and also includes a market in which the free circulation of commodities is permissible. The role of the law of supply and demand is much more conspicuous in the free-circulation market than in the market that is subject to planning. In the buying and selling among the socialist enterprises that are engaged in production, in the making of purchases from producers by the socialist commercial organizations, in the sale of products by such organizations to the consumer, and in the selling and buying among such organizations, negotiated prices and floating prices rise and fall with changes in the supply of, and demand for, third-category commodities which are not subject to state planning, second-category commodities produced in excess of planned tagets, and a small portion of first-category commodities for which free circulation is permitted. The only peculiarity is that in the case of commodities subject to floating prices, prices may vary only within the prescribed limits within which they are permitted to float. Changes in the prices of these commodities in turn help regulate changes in supply and demand. When prices rise, enthusiasm in selling is enhanced; and when prices fall, enthusiasm in buying is promoted. Moreover, the rise and fall of prices play a very important role in regulating the production of those commodities whose free circulation is permitted, in particular the third-category commodities, including agricultural and industrial products, means of livelihood and means of production, has been fluctuating. Invariably, periods of excess supply lasting several years have alternated with roughly equally long periods of inadequate supply. This provides evidence for the role of the law of supply and demand in regulating those commodities which are allowed to be freely circulated within the socialist economy.

The limitation on the law of supply and demand is more severe in the market that is subject to planning. This is particularly so with regard to goods and materials subject to centralized distribution by the state and also commodities subject to state monopoly for purchase and marketing. However, even so, the law of supply and demand has not ceased to work. Consider the regulatory effect on prices. In recent years, the overstocking of some means of production has been a very serious problem. The excessive stock of steel products has reached [words indistinct] building and electrical machinery industries is worth more than 60 billion yuan. Therefore, aside from readjusting our economic structure, striving more vigorously to suit production to needs and making our products marketable, we have been forced to do away with convention of distribution and allocation by the state, to permit enterprises engaged in production to market some overstocked means of production and organize exhibitions and trade fairs, to entrust the marketing of products to commodity departments and commercial departments, to organize markets in the means of production, to organize cooperation in handling goods and materials, and so on. Moreover, some prices different from those prescribed by plans are set for commodities handled by means of cooperation, and prices of some commodities purchased or marketed by the state are determined through negotiation. Thus, the prices of these commodities can move downward. Furthermore, goods and materials that have been kept in stock for many years have been subject to open supply and also price cuts. In regard to the means of livelihood, although the overall market situation is marked by supply falling short of demand, the composition of goods in stock is irrational. The prices of many commodities must be lowered because their sales are small and their stocks abundant, they are not marketable, their quality is inferior and their prices are high, or they have deteriorated in quality or have been damaged. In 1978, the system of commercial departments alone handled and cut the prices of a stock of such commodities worth nearly 3 billion yuan, the losses involved amounting to over 500 million yuan. A considerable proportion of such commodities consisted of those subject to planning, especially knitted and cotton textile goods. This situation has still not been completely put to an end. These facts have demonstrated that the law of supply and demand does play a role in the market that is subject to planning. Actually, this role is not necessarily reflected in modifications of prices prescribed by plans. Even when such prices remain fixed, this role will be indirectly reflected in disguised rises or falls in prices. Although the state plans specify the prices of those commodities that are subject to planning, including those subject to state monopoly for purchase and marketing, free prices have always existed, including not only free prices openly quoted in country trade fairs, but also black market prices. The free prices produce an impact on prices stipulated by state plans, so that the state, aside from prescribing the latter, must also adopt some flexible measures. For example, in recent years, in the purchase of agricultural products, there are a number of schemes such as the bonus-rate prices for purchases in excess of planned targets; bonuses in the form of certain quantities of those goods or materials purchased (which actually enable the sellers to earn the difference between the country fair price and the planned price); the fixing of basic quantities purchased so that the producers can retain an appropriately larger quantity of their output in excess of planned targets (thus actually enabling the sellers to earn a higher income by selling their retained products at the country fair prices); purchases with payment in kind (actually enabling the participants of this scheme to earn the difference between the planned price and the country fair price by selling the manufactured products they obtain by offering their own products in exchange); the return of processed sideline products to sellers (returning certain quantities of processed sideline products, such quantities being calculated on the basis of the quantities of agricultural products sold as raw materials, so that the sellers can earn the difference between the planned price and the country fair price); the return of profits to sellers (returning a certain proportion of profits arising from the processing of agricultural products sold as raw materials, the returned profits being calculated on the basis of the quantity of agricultural products sold, so that the sellers' income can be increased); and so on. Consider another example. The prices of certain commodities subject to planning remain unchanged. However, when supply falls short of demand, the quality of these commodities is lowered, work is done shoddily or inferior materials are used or wrong parts are assembled together in producing them, and so on. When supply exceeds demand, the commodities are disposed of through hire purchase, supplying them at reduced prices, gratuitous delivery of goods, internal price discounts and so on. All this is an indication of the role of the law of supply and demand. Considering the regulation of supply and demand by price, we can see that over many years, because the pricing structure has been irrational, the prices of some commodities subject to planning have stayed above their values, promoting the aimless development of production and restricting demand. Consequently, these commodities have been in excess supply and have been overstocked. The prices of some other commodities have stayed below their values, affecting enthusiasm in producing them and encouraging people to consume them. Consequently, they have been in short supply for many years, some of them having even been out of stock. Moreover, price changes have been unable to help determine changes in the total quantities supplied or demanded, but the latter have been able to help determine the overall level of commodity prices. This is also an important reflection of the role of the law of supply and demand. The socialist centralized market is in a similar situation. In the market, whenever the total quantity supplied is relatively close to the total quantity demanded, commodity prices are rather stable; but when the shortage of supply compared with demand is relatively severe, the overall level of commodity prices tends to rise conspicuously.

Thus, it can be seen that the law of supply and demand objectively exists in the realm of the socialist centralized market and also plays a regulatory role. Just as we understand the point: "Where there are commodities and the production of commodities, the law of value cannot be dispensed with," we should also clearly understand that where there is a market, the law of supply and demand must definitely exist and play a role.

III. Under Socialist Conditions, We Must Exploit the Role of the Law of Supply and Demand

Because the law of supply and demand objectively exists and plays a role in the socialist centralized market, we must respect this objective law when we organize the socialist economy. We must, as far as possible, prevent it from playing its role blindly and thus hampering the development of the socialist economy. We must also fully exploit its role to serve the development of the socialist economy.

First, in formulating national economic plans, we must exploit the role of this law to serve the organization of equilibrium between supply and demand and the organization of the comprehensive equilibrium of the national economy.

The aim of socialist production is to satisfy the ever-growing material and cultural needs of the masses of people. Therefore, production must be compatible with consumption and social production must be organized in the light of social needs. Under the conditions of a well-developed commodity economy, social reproduction must be achieved through the circulation of commodities, because in such an economy, the relationship between social production and the marketing of products must be reflected in the relationship between market supply and demand. This requires that the market supply of commodities must be compatible with the market demand not only in terms of the total quantities exchanged, but also in terms of composition, so that social reproduction can be achieved. Therefore, in formulating national economic plans, we must respect the law of supply and demand and consciously use it to serve the organization of equilibrium between supply and demand. That is to say, first, we must conscientiously study the conditions and trends of development of market supply and market demand; in particular, we must conscientiously study and analyze the conditions of supply of and demand for those products which are important to the entire national economy, and make scientific forecasts correspondingly. If there is disequilibrium between supply and demand in terms of total quantity or composition, we must pay special attention to readjusting the proportions in production and distribution, and we must also fully make use of the lever of pricing. That is, under the prerequisite of maintaining price stability and a rational price structure, and in the light of the available national financial and material resources we must appropriately readjust the prices of certain commodities to facilitate the attainment of equilibrium between the supply of and demand for commodities, and also comprehensive equilibrium in the national economy. For example, when the supply of consumer goods falls short of demand to a relatively considerable extent, we should help satisfy the needs generated by any additional purchasing power, and by means of pricing, we should more vigorously plan for promoting the production of those commodities that are in line with the orientation or allocation of the additional purchasing power, especially those commodities which help withdraw a great deal of money from circulation. Moreover, we can appropriately raise the price of some commodities whose supply falls short of demand, and which are not very important to the national economy and the people's livelihood, so that larger sums of money can be withdrawn from circulation.

Second, in implementing our plans, we must exploit the role of the law of supply and demand to regulate production, circulation and consumption.

The socialist economy is a planned one. To ensure its proportionate development, we must organize production and circulation and guide consumption in a planned way. The implementation of plans must rely on market activities, and therefore must be affected by the role of the law of supply and demand. Precisely because of this, we can also let the role of this law serve regulation by planning mechanism. In implementing plans, in the light of feasibility and necessity, we must appropriately raise the prices of those commodities whose supply falls short of demand. (Of course, generally, the prices of those commodities essential to the people's daily life must not be raised even if supply lags behind demand.) Conversely, we must appropriately lower the prices of those commodities whose supply exceeds demand. We can use such upward or downward price adjustments to promote or restrict production, purchases and marketing, to readjust supply and demand, to encourage or limit consumption, and to induce consumers to economize on commodities in short supply and use substitute goods in the production of which the resources used are amply available. Thus, we can help make supply and demand, and hence production and consumption, become compatible with each other. Aside from readjusting prices in a planned way, we can also flexibly use various economic levers such as profits, taxation, credits and so on so that they can serve the successful implementation of our plans. Actually, this is another form of price adjustment. For example, if we grant tax or profit concessions to producers of certain commodities, or if the banks grant them loans at low interest rates, then with the retail prices remaining unchanged so that the consumers' interests can be safeguarded, the producers are actually being subsidized in some ways other than a price subsidy.

Third, in the reform of our economic systems, we must exploit the role of the law of supply and demand so that we can establish a rational pricing system and fully bring the regulatory role of price as an economic means into play.

The reform of our economic systems is a major change affecting the relationship between the production relations and productive forces as well as the relationship between the superstructure and the economic base. The essence of this reform is to liberate the productive forces and to create the most favorable conditions for the long-term and healthy development of our national economy. In this reform, the commodity-pricing system should be the first to undergo reform, because a rational commodity-pricing system is an absolutely indispensable external condition for the normal functioning of various economic entities. To make the commodity-pricing system rational through reform, we must fully exploit the role of the law of supply and demand. This is because over many years in the past, the control on our commodity-pricing system has been too rigorous, so that this system has been very rigid, lacking the requisite amount of flexibility. The limits of authority have been too narrow for the localities. The enterprises have almost no power to set prices. The range of commodities whose prices are prescribed by the plans is too broad. There has only been one single form of pricing. All these amount to a disregard of the law of supply and demand. In the reform of our systems, we should pay attention to the role of this law and we must fully bring the supplementary role of regulation by market mechanism into play under the guidance of planning. That is, we must appropriately reduce the range of commodities whose prices are determined through planning. Some commodities are not very important to the overall situation of our economy and market, and it is inconvenient for the state to directly specify their prices in its plans. Changes in their prices should be automatically regulated by changes in market supply and demand, so that their production, circulation and consumption can be regulated. Diverse forms of pricing should be adopted. In addition to fixed prices, there can be various other forms of prices for some categories of commodities, such as floating prices, prices set by the enterprises themselves, prices for products produced through cooperation, negotiated prices, and country fair prices which change with changes in supply or demand within the limits of the country fair. These are forms of pricing that embody automatic regulation to various degrees. In determining prices through planning, not only must supply and demand conditions be taken as an important basis in the determination of purchase, transfer, wholesale and retail prices, but the differences between these prices must also be flexibly regulated according to the state of supply and demand. The expenditure of the necessary social labor time must be taken as the basis for determining basic price differences, whereas in the determination of actual price differences, such differences must be consciously enlarged or reduced in the light of conditions of supply and demand. It is only in this way that regional price differences help encourage or restrict circulation or transport of commodities between localities; seasonal price differences can help promote or restrict the stocking of goods or the purchasing or marketing of goods ahead of time or at a delayed time; price differences due to differences in variety can help promote the increased production of marketable varieties and help curb the production of unmarketable goods, so that most varieties of products offered for sale are marketable and the replacement of old products and old varieties by new ones is quickened; price differences due to differences in quality can help stimulate the production of superior quality products and penalize the production of inferior quality ones; and price differences due to differences in grade can help promote the increased production of products of marketable goods and help curb the production of those of unmarketable grades. Ordinary commodities (except those in seriously short supply) must be subjected to a system of gradual price reduction, so that the removal of old products from stock, the production of new ones and also the turnover of commodities can be speeded up. Some commodities are highly perishable, such as fresh fish, meat, vegetables and fruit and so on. Their prices may be allowed to change in a matter of days or even in the same day, so that they can be quickly sold before they go bad. Thus losses can be prevented. With the commercial departments, a uniform discount rate must not be applied to all commodities without consideration to differences in grade, value, marketability or order of importance, because this will dampen the enthusiasm in operations of wholesale and retail units in the localities where the commodities are sold, and will be disadvantageous to the operations in marketing minor commodities and to the selling of overstocked commodities. To sum up, pricing must be reasonably flexible and the role of the law of supply and demand must be fully exploited. To achieve this, the power to manage commodity prices must be appropriately transferred to the lower levels; the limits of the localities' authority in regard to the pricing of commodities must be extended; and economic organizations and the enterprises must be assigned greater power to determine commodity prices. Moreover, under the auspices of centralized state planning, measures must be formulated to suit local conditions and various problems concerning commodity prices must be tackled promptly and flexibly, so that the attainment of equilibrium between supply and demand can be promoted, production can further develop, circulation can be enlivened and consumption can be properly guided.

Lastly, to stabilize commodity prices, the role of the law of supply and demand must be exploited.

Although the law of supply and demand states that commodity prices change with changes in supply and demand, the exploitation of the law is not bound to be in contradiction to the stabilization of commodity prices. In any case, the overall level of commodity prices can be stabilized only on the basis of a proper proportion of supply to demand. To achieve such stability, we must not rigidly stick to the idea that changes in the prices of individual commodities are in contradiction to price stability. On the contrary, so long as commodity prices are kept from fluctuating conspicuously, certain flexible changes in commodity prices which can promote the attainment of equilibrium between market supply and demand are desirable.

To sum up, the role of the law of supply and demand objectively exists in a socialist society. If people know this and consciously exploit it, they will achieve results favorable to the development of the socialist economy. If people deny this objective law or even act against it, they will inevitably be penalized in real life.

IV. Our Own Understanding on Several Popular Views

Over many years, people have held many different views on the law of supply and demand as it appears under socialist conditions. This is natural. Here we will present our own preliminary views on some of these views

1. Will regulation by means of the law of supply and demand inevitably lead to the development of capitalism?

Under capitalist conditions, the distribution of social labor (including the means of production and the labor forces) among various sectors is accomplished amid competition and under the aimless regulator actions of the law of value and the law of supply and demand. Price becomes the baton which directs socioeconomic activities. Under socialist conditions, the situation is different. Social labor is distributed among various sectors through regulation by planning mechanism and according to the requirements of the law of the planned proportionate development of the national economy. However, this does not mean that it is impossible and unnecessary for the state to undertake the requisite regulation of social labor through market activities. This is because by means of regulation by market mechanism, we can only proceed from society to prescribe the distribution of total social labor among various sectors, thus arriving at various ratios relevant to economic development; but commodities are numerous and our plans cannot embrace everything. Therefore, we need the coordination of regulation by market mechanism. That is, market prices, like levers, provide guidance for producers of commodities and other people involved in various categories of operations, so that they will divert the means of production and labor forces under their control from the production of commodities whose supply exceeds demand to those commodities whose supply falls short of demand. This will be conducive to the proportionate development of the economy. Thus, we must naturally exploit the regulatory role of the law of value and that of the law of supply and demand. Because these regulatory roles take place under the socialist and not capitalist conditions, because they do not occur spontaneously but are exploited consciously, and because they are not concerned with the overall distribution of the total social labor but are concerned with exerting regulatory effects on various enterprises, they will not give rise to capitalism, but on the contrary, they will be conducive to the development of the socialist economy. The law of supply and demand, like the law of value, governs the commodity economy and is not peculiar to the capitalist economy. Just as we have rehabilitated the reputation of the law of value, we should likewise eliminate the misunderstanding about the law of supply and demand.

2. Is it true that the law of supply and demand can only play a role aimlessly and spontaneously and cannot be consciously applied?

A popular view is that a change in supply or demand and a change in price can affect each other at any time, and therefore, under socialist conditions, it is very difficult to talk about exploiting the role of the law of supply and demand. We hold that all objective laws are independent of man's will, and the law of supply and demand is no exception. Whether people know and apply it or not, it will play its role. However, objective laws can be understood and applied. There is no law that is doomed to play an aimless role only. People cannot apply a law, so that it will play an aimless role, only when they do not understand it. We can consider the regulatory role of the law of supply and demand as the basis for regulation by market mechanism precisely because this law can be understood and applied (though changes in supply and demand are complicated). Of course, conscious application is not tantamount to saying that all regulation must be conscious. Sometimes, within the limits of what we can exercise control over, it is harmless to let the objective role of the law of supply and demand bring about automatic regulation. For example, when setting planned prices, we may consciously exploit the role of this law to effect regulation. However, in adopting the country fair prices, the negotiated prices, the prices for products produced through cooperation and the floating prices, we can let the law play the role of automatic regulation. To exploit the role of the law in this way is not tantamount to some blind action.

3. Is the regulatory role of the law of supply and demand confined to the market in consumer goods without [word indistinct] the market in the means of production?

In the past, because there was an erroneous idea that only consumer goods are commodities and the means of production are not, some comrades drew the conclusion that objective laws governing the commodity economy, including the law of supply and demand, do not play a role in regulating the circulation of the means of production. Now that many people have resolved the question of whether the means of production are commodities under socialist conditions, the question of whether the law of supply and demand plays a role in regulating the market in the means of production can be easily resolved.

4. In the reform of our pricing structure, should we insist that price must be consistent with value, or should we allow price to deviate from value?

A popular view holds that for many years, our pricing structure has been gravely irrational. The prices of many commodities have deviated too substantially from their values. Therefore, in the reform of our pricing structure, we must make price compatible with value. Only thus can the objective requirement of the law of value be reflected. We hold that if this view means that the pricing structure, or the relationship of relative prices, embodies taking the values of various categories of commodities as the basis on which commodity prices are formed, then this view is correct. We began to stabilize commodity prices in 1950. At that time our commodity prices were not free from the relative price relationship that had been formed in the semifeudal, semicolonial old China. However, the pricing structure of old China was formed under the condition of imperialism plundering raw materials at low prices and selling manufactured goods at high prices. Subsequently, despite many rounds of investigation [as published], the shortage of supply relative to demand continued to plague the market for a long time. Thus, to stabilize prices became the primary task in our work in connection with commodity prices. Moreover, several setbacks in economic development caused disequilibrium in fiscal revenue and expenditure, so that price readjustments were limited to some patchwork efforts and a relatively thorough reform was impossible. That is to say, the majority of price readjustments in the past were basically readjustments of the prices of some individual commodities under the condition that there was no major change. Therefore, many aspects of the present pricing structure are still irrational and villate the requirements of the law of value. Of course, to eliminate such irrationality through reforming the pricing structure, we must take value as the basis to set prices for various categories of commodities, and thus to establish a rational relative price relationship. However, we must definitely not erroneously consider a rational pricing structure as a relative price relationship formed by a set of prices which must be consistent with values, because actually this implies denying the fact that it is both possible and necessary for price to deviate from value, and thus implies denying the role of the law of supply and demand in regulating prices. In the foregoing analysis, we have said that regulation by market mechanism not only involves the exploitation of the regulatory role of the law of value, but also involves the exploitation of that of the law of supply and demand. Therefore, rational prices must not only be based on value, but must also embody a full consideration of the relationship between supply and demand and must take changes in supply and demand as an important basis. Therefore, when we readjust the pricing structure, we must permit prices to deviate from values to various degrees in the light of the order of importance of each commodity and other relevant specific conditions. That is, we can raise the prices of certain commodities whose supply lags behind demand to a level above their values, and lower the prices of certain commodities whose supply exceeds demand to a level below their values. When supply and demand become consistent, we can readjust prices to bring them closer to values. Only thus can the requirements of the law of supply and demand be satisfied and can the power of pricing policies be brought into play. Such appropriate rises and falls in price in response to changes in supply and demand are not in contradiction to the necessity for prices to have values as the basis, because rises and falls in price are still centered round value as the core. Such appropriate rises and falls in price in response to changes in supply and demand are quite different from the past phenomenon of prices staying above or below values for long periods of time. The latter phenomenon reflected the violation of the requirements of both the law of value and the law of supply and demand, because it meant that price deviated from value for a long time; that in addition, price continued to deviate from value even when supply and demand became consistent; and that there was even an irrational situation of price continuing to stay below value when supply fell short of demand, and continuing to stay above value when supply exceeded demand. Therefore, a rational pricing structure should take both the law of value and the law of supply and demand as its basis.

We must not apply only one of these two laws. We must not one-sidedly require price and value to be always consistent. We must not one-sidedly require price to deviate from value without approaching it. We also must not distort the meaning of the idea that price must be readjusted at appropriate times according to changes in supply and demand by saying that price can remain fixed for a long time independently of changes in supply and demand, staying for a long time above or below value. Only a pricing structure that is established on the basis of the requirements of these two economic laws can be rational and can promote the rationalization of the production structure. Conversely, if we violate the requirements of these two economic laws and the pricing structure is irrational, then it will be difficult for the production structure to become rational.

ECONOMIC RESPONSIBILITY SYSTEM DISCUSSED

HK020745 Beijing JINGJI QUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 81 pp 10-11

[Article by Feng Yi [2800 1355]: "Bravo to the Economic Responsibility System Practiced by Industrial, Transport, Financial and Trading Enterprises!"--slantlines denote boldface type]

[Text] At present, industrial, transport, financial and trading enterprises throughout the country are actively enforcing the economic responsibility system. In the past few months since April, the situation has been developed even faster and the effects have been better than expected. Practice has shown that to establish and practice the economic responsibility system in industrial, transport, financial and trading enterprises is something developed among the masses, which is consistent with the present productive and administrative levels in our country and accords with the general trend and the people's will.

The enforcement of the economic responsibility system in industrial, transport, Financial and trading enterprises is definitely not fortuitous. Over the past years, various responsibility systems have been practiced by a few enterprises and have made certain contributions to strengthening enterprise administration. Because they were directly linked to the material benefits of enterprises and staff and workers themselves, those systems failed to produce greater effects, and some of them even became mere formalities. In the last 2 years, in implementing reforms of economic systems, we have expanded the self-determination power of enterprises; under the direction of the state plan, we have strived to give full play to the function of market conditions and thereby give the enterprises some economic motive force. Inspired by the success achieved in practicing the system of linking remuneration to production in agricultural production and after having summed up the historical experiences of the practices of system reforms in our country, the economic responsibility system practiced by industrial, transport, financial and trading enterprises was developed. This system has emerged as the new situation required.

The economic responsibility system practiced by industrial, transport, financial and trading enterprises aims mainly at overcoming two kinds of egalitarianism: that existing among enterprises, and the other inside enterprises. Therefore, in order to make the economic responsibility systems function in these two aspects, we must handle well the economic relations between the state and enterprises and expand the enterprises' system of economic responsibility to the state; in other words, we must "assign" to enterprises the tasks which are designated to them according to the state plan and the portion of profits they should hand over to the state, to ensure the necessary conditions for accomplishing the tasks, and therefore further resolve the problem of binding the enterprises too tightly and that of "eating out of a big pot." On the other hand, we must also handle well the distribution relations inside each enterprise, and broaden the internal economic responsibility system; in other words, the tasks assigned to each enterprise and the expected economic results should be reassigned to every individual in the enterprise, according to the responsibilities of different levels, units and posts. In the meantime, the income of staff and workers should be directly linked to the labor achievements. The enterprises' system of economic responsibility to the state is the prerequisite while that inside each enterprise is the basis for economic work; they complement each other and form an organic entity. Without the economic responsibility which enterprises undertake for the state, there will be no basis for the economic responsibility system inside every enterprise. On the reverse side, the former cannot be carried out without the latter.

Of course, due to the differences in the nature and characteristics of production, subjective and objective conditions and so on between various enterprises, the forms of the economic responsibility systems for enterprises and inside enterprises should be varied. But no matter what concrete form they take, we must always pay attention to the following problems so real effects can be achieved.

1. /Properly handle the economic interests of the state, enterprises and staff and workers./ More revenue for the state means more profits retained for enterprises and more income for individuals; better economic effects is the key link to ensure more revenue for the state and more income for individuals. In coping with this problem, the practice of paying attention to just one aspect must be avoided and fraudulent practices must not be allowed. The enforcement of the system of taking full responsibility for profits and losses in enterprises must be integrated with the setting of norms such as productivity, variety, quality, consumption, safe production and so on. The enterprises must ensure that the state plan can be comprehensively completed. Required to be responsible to consumers, they should pay more attention to reaching the target of socialist production. In practicing the economic responsibility system inside enterprises, we must also aim at the overall completion of the state plan in the whole enterprise and the realization of increased production and revenue.

2. /Well-defined responsibilities, strict assessment and rewards and penalties in forms of economic benefits must be integrated so as to make the various responsibility systems in all sections of an enterprise compatible and form a complete set of responsibility systems./ A sound set of responsibility systems is the important guarantee for an enterprise to carry on regular productive activities and realize the expected economic results. The relations between different links and different jobs must be cooperative relations of labor division inside an entity. Therefore, the leadership responsibility system for heads of plants (managers), the responsibility system practiced in every workshop (office), team and group, and finally the job responsibility system for every

staff member or worker must all center around the completion of the overall task of enterprises, and thereby be provided with well-defined requirements. All factors such as power, responsibility, effect and profit must be comprehensively and organically integrated, in which the effect is the key factor, with the well-defined responsibilities as the basis. Here the effect not only means the working results of an individual but also in particular the comprehensive and actual economic results of an enterprise. In practicing the economic responsibility system, we must expand various basic functions of enterprise administration. At present, we must pay special attention to those basic functions such as administration and so on, so as to build up the economic responsibility system on the basis of scientific administrative works.

3. /Ideological and political works must be strengthened./ Under the economic responsibility system, the economic results achieved by an enterprise are directly linked to the material benefits of the enterprise and its staff and workers. This is an efficient way to overcome egalitarianism. Therefore, in the enforcement of the system, we must conscientiously carry out rewards and punishments and keep our promises to the people. However, the guarantee of material benefits can never substitute for political and ideological education. On the contrary, in practicing the economic responsibility system, we are bound to come across various ideological and practical problems. For this reason, it is necessary to strengthen ideological and political works, thoroughly arouse the initiative of the vast numbers of staff and workers as the masters of the cause through well-oriented, convincing, thoroughgoing and painstaking ideological work. The sense of political responsibility, combined with economic responsibilities, is the solid guarantee for kindling the enthusiasm of enterprises and their staff and workers. We must have a comprehensive understanding of this matter while carrying out the economic responsibility system.

Today, although the economic responsibility system has just been started in industrial, transport, financial and trading enterprises and a lot of problems still need to be discussed, we have been able to see that the system is a good form for further carrying out the principle of distribution according to work, a step toward the rectification of enterprises, and an important enrichment to the reform of economic administrative system. Following its gradual perfecting, the system will surely show its vitality daily.

ECONOMIC PLANNING

BRIEFS

GANSU COMMERCIAL MANAGEMENT FORUM--Gansu Province held a forum on managerial responsibility systems of commercial enterprises from 6 to 12 October. The forum reported that as of mid-September, 1,275 retail sale departments, restaurants and service centers in the province, 32.9 percent of the total, had instituted managerial responsibility systems. The forum urged that profit quotas to commercial enterprises be scientifically and reasonably fixed so that state revenue will not decrease and enterprises' interests are protected; that maximum amounts of bonuses and workers' wages be fixed; that the workers' floating wage not be given too great a portion and that regulations for labor protection and other benefits not be easily changed. LOANS HELD DIVERSIFY BEIJING'S RURAL ECONOMY

OW051345 Beijing XINHUA in English 0256 GMT 5 Nov 81

[Text] Beijing, November 5 (XINHUA)--Bank and credit cooperative loans amounting to 15.6 million yuan have been taken out in the first nine months this year especially for diversifying the rural economy in the Beijing area, according to the municipal people's bank authorities.

Around 14 million yuan has been loaned to 2,800 production teams in the area to diversify the rural economy, and another 1.6 million yuan has gone to individual peasant families to develop household sideline production. Loans of this kind started to be made in May last year to promote forestry, fishery, animal husbandry, collective sideline production and household sideline production in a bid to increase the income of the peasants as well as of the collective units and to improve the market supply.

Production resulting from such loans has provided 50,000 rural people with jobs so far this year. According to incomplete statistics, some of the money has been used for 250,000 hens for egg laying as well as a large number of pigs, rabbits, ducks and bees.

From January to September this year, the loans taken out and repaid in the Beijing area by the rural communes and their subdivisions were 40 percent more and by individuals 53 percent more than in the same period of 1980. Bank deposits in Beijing's rural areas also rose during the period.

INDUSTRY

SHANGHAI SENDS MORE GOODS TO COUNTRYSIDE

OW021215 Beijing XINHUA in English 1220 GMT 2 Nov 81

[Text] Shanghai, 2 Nov (XINHUA)--Shanghai, China's leading industrial and commercial city, will provide China's rural markets with five percent more consumer goods this year than last, according to an official of the municipal commercial department.

From July through September this year, the city shipped more than 1,200 million yuan worth of daily necessities, cotton knitwear and household electric appliances to different parts of the country, 11.3 percent more than during the same period in 1980. The volume of the cotton knitwear shipped out was up 17.5 percent, the official said.

Shanghai shipped out eight percent more sewing machines in the July-September period this year, 18 percent more rubber boots, 17 percent more aluminium pots and pans and 150 percent five-pound thermos bottles, compared with the same period of last year. Television sets were up nearly 60 percent and radio sets up 32 percent.

China expects a good harvest this year, which means the purchasing power of the peasants will continue to rise.

Figures from Shanghai's commercial department show that, from January through September this year, the volume of retail sales for consumer goods in the city's suburbs, which have a population of 5.45 million, rose 11.9 percent over the same 1980 period, while in the urban districts with a population of more than six million sales were up 7.2 percent. Rural market sales of wrist watches, TV sets, woolen piece goods and bedsheets increased between 20 percent and 100 percent over the 1980 corresponding period.

New designs account for one third of the 2,000 kinds of cotton knitwear shipped to the country's rural areas. Shipments of knitting wool, cotton sweaters and trousers and synthetic fabrics went up from 40 to 100 percent in the July-September period this year.

XINING MAYOR VIEWS INDUSTRIAL OUTPUT FIGURES

SK050850 Xining Qinghai Provincial Service in Mandarin 2330 GMT 4 Nov 81

[Excerpts] (An Diming), Xining municipal mayor and deputy to the provincial people's congress, said: Since the last half of 1981, the industrial and communications fronts in Xining Municipality has scored remarkable economic achievements following the implementation of responsibility systems. By the end of September, Xining Municipality had fulfilled 74 percent of the annual industrial output value plan. The average monthly profits gained in July, August and September increased 180 percent over that of the January-June period.

(An Diming) said: There are three good points in implementing the economic responsibility system: 1. We can achieve the goal of increasing production and income. 2. This system helps promote enterprise consolidation and improve product quality. 3. It ensures the state will collect more revenue, enterprises to share more profits and individuals have more income.

(An Diming) said: The industrial output value plan of Xining Municipality in 1981 is 260 million yuan. Thanks to the implementation of the economic responsibility system, the industrial output of Xining Municipality has been increasing in the last half of this year. We are summing up our experience, studying the new situation and solving new problems. We are determined to overfulfill this year's industrial and communications plan.

BRIEFS

SHANDONG AIR-RAID SHELTERS--Qingdao, 30 Oct (XINHUA)--The coastal city of Qingdao in Shandong Province, in an effort to use thousands of square meters of idle space, has recently converted unused air-raid shelters to public utilities. A total of 63,000 square meters of space thus made available have been converted to warehouses, hotels, cold storage, restaurants and meeting rooms. The city's commercial department has converted enough room for a cold storage with a capacity of 10,000 tons. In July, the Qingdao No 3 Knitwear Mill used 8,000 square meters for storage of imported nylon. Use of the shelter space will mean a financial savings of 100,000 yuan each year which the mill used to spend on rent. Two hotels and four restaurants have opened in air-raid shelters since 1980. One hotel, the Longshan, has 55 rooms, 200 beds and a dining hall with a capacity of 300. [Text] [OW311131 Beijing XINHUA in English 0717 GMT 30 Oct 81 OW]

GUANGZHOU HOUSING PROJECT--Guangzhou, 24 Oct (XINHUA)--Construction began this week of a housing project, called New Jiangwan Village, on a land fill in the Pearl River in Guangzhou, capital of Guangdong Province. The Pearl River Foreign Investment Construction Company of China is building the project in cooperation with American United Properties, Ltd of Hong Kong. New Jiangwan Village will cover an area of 27,000 square meters. The first phase included five buildings of 20 or 25 stories. The housing project which was designed by architects from Guangzhou and Beijing will eventually have buildings of different heights and designs interspaced with parks. All the buildings will be on raised pilings so that pedestrians can walk through the arcades and see the Pearl River. [Text] [OW261211 Beijing XINHUA in English 1224 GMT 24 Oct 81 OW]

BRIEFS

TEXTILE WORKERS MEETING--Zhengzhou, 25 Oct (XINHUA)--A national meeting of young textile workers to exchange experiences in operations closed in Zhengzhou, Henan, on 25 October, after 10 days in session. In a speech Hao Jianxiu, minister of textile industry, called for efforts to launch mass activities to study, exchange and master basic operational skills in order to further develop the textile industry. She said: The textile industry's average total output value in 1979 and 1980 increased 18 percent each year. Taxes paid to the state and profits made by the textile industry in these 2 years rose an average of 19.8 percent each year. Foreign exchange earned by the textile industry in these 2 years increased an average 22 percent each year. [Beijing XINHUA Domestic Service in Chinese 1641 GMT 25 Oct 81 OW]

GUANGZHOU YOUTH INDIVIDUAL UNDERTAKINGS--In Guangzhou Municipality, individual industrial and commercial undertakings engaged in by youths awaiting jobs increased from 5 percent in 1979 to 46 percent now of the total number, and has reached the figure of 6,700 persons, the greatest in number among the eight biggest municipalities in the country. Their businesses include handicrafts, barbers, tailors, the repair service trades, and hawkers of food and small commodities. They enliven the market and facilitate the people's livelihood. The basic reason for the increase in their number lies in the implementation of the party's policy of giving them political and economic equality and rendering help to them. The departments concerned supply the raw materials they need at wholesale prices and help them to solve the problems of business sites, funds and technology. Measures have been adopted to encourage youths awaiting jobs to go in for individual businesses. They include simplification of the procedures of application for business licenses, revocation of unreasonable economic burdens such as street charges and charcoal charges and the adoption of regulations that do not restrict their turnover and economic income as long as they are not illegal. Now the average monthly turnover of those engaged in commerce is 300 to 400 yuan and their average monthly income is 80 to 90 yuan per capita. The average monthly income of those engaged in roasted and cured foods that are more profitable is about 200 yuan per capita. [HK160801 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 13 Oct 81 HK]

TIANJIN PROFIT-INCREASING CAMPAIGN--The Tianjin Municipal Trade Union Council on 27 October held a rally to report on the achievements in the campaign in which staff members and workers are encouraged to create more profits for the state. Labor models, workers, engineering and technical personnel, managerial cadres and some collectives who distinquished themselves in this campaign were commended at the rally. The campaign was initiated first at the municipal metallurgical industrial bureau. Through tapping potential, each of its some 20,000 workers created 1,700 yuan more profits for the bureau. By the end of September, the bureau had earned 190 million yuan of profits, 82 percent of its annual target. During the January-September period, each worker at the municipal textile bureau created 340 yuan more in profits for the bureau. The municipal communications bureau also launched the campaign in July. By the end of September, this bureau had fulfilled 99.84 percent of its annual profit quota. BRIEFS

HUBEI RAILWAY SERVICES--Beginning 0000 hours on 11 October, like all other railway bureaus throughout the PRC, the Wuhan Railway Bureau will bring into effect the new schedule for the movements of trains. Hubei will properly readjust passenger trains and add passenger trains to railway services. In accordance with the new schedule, the speed of the trains of the Wuhan Railway Bureau will be increased. Numbers 137 and 138 direct passenger express trains from Wuchang to Beijing will be changed to Nos 37 and 38 special express trains and the traveling time will be 2 hours and 10 minutes shorter than before. Numbers 107 and 108 express trains from Wuchang to Chengdu vis Chongqing will be changed to Nos 117 and 118 express trains which will run from Wuchang to Chongqing in future. The Wuhan Railway Bureau will add a slow train between Wuchang and Hengyang and a direct express train between Beijing and Chongqing via Luoyang, Xiangfan and Jiayu counties to the schedule. The express trains between Beijing and Nanchang via Wuchang and between Beijing and Guiyang via Wuchang which now run every other day will run every day in future. [HK260749 Wuhan Hubei Provincial Service in Mandarin 1100 GMT 7 Oct 81 HK]

XINJIANG RAILWAY SERVICES--Beginning 0000 hours on 11 October, a new schedule for the movements of passenger trains throughout the PRC will become effective. From this date, No 54 direct passenger express train from Urumqi to Shanghai and No 70 direct passenger express train from Urumqi to Beijing will be changed to special express trains. After the change, the traveling time of No 54 train will be 78 hours and 4 minutes, 4 hours and 34 minutes shorter than before the change. The number of stops at stations will be reduced from 72 to 49. The traveling time of No 70 train will be 72 hours and 36 minutes, 4 hours and 53 minutes shorter than before the change. The number of stops at stations will be reduced from 77 to 49. After the new schedule becomes effective, No 144 direct passenger express train from Urumqi to Xian will be added. Number 72 train from Urumqi to Zhengzhou will be changed to No 172 direct passenger express train. Number 144 train from Urumqi to Lanzhou will be changed to No 244 direct passenger express train, which will run every 2 days. Number 394 train from Urumqi to Yumen will be changed to No 494 direct passenger train. The time of leaving Urumqi of the above-mentioned trains will be: No 54 train at 1650 hours; No 70 train at 2133 hours; No 172 train at 0925 hours; No 144 train at 1923 hours, No 244 train at 1500 hours, and No 494 train at 2209 hours [local times]. [HK200803 Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 8 Oct 81 HK]

XINJIANG RAILWAY LINE--The entire South Xinjiang Railway Line opened to traffic on 20 October. The railway line, which starts from Turpan in the east and ends at Korla in the west, is over 470 km in length. Construction of this railway started in 1974. The PLA Railway Engineer Corps Unit which took part in this project dug 29 tunnels with a total length of 33 km and built 492 bridges. [OW231115 Beijing Domestic Service in Mandarin 2230 GMT 21 Oct 81 OW]

NORTHEAST CHINA TRANSPORTATION--On 1 October an integrated highway transport service was established in Shenyang, Liaoning Province; Changchun, Jilin Province; and Harbin, Heilongjiang Province. Highway transport stations have been established in the three municipalities to handle municipal transportation. The dispatch of vehicles and accounting will be made in a unified way to improve efficiency. [SK132241 Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 12 Oct 81 SK]

HEILONGJIANG RIVER TRANSPORT VOLUMES--This year's navigation period for the Heilong Jiang in Heilongjiang Province ended on 20 October. Thanks to responsibility systems, Heilong Jiang transport volumes for this year reached a record high. Its passenger transport volume was 77,000 people, 54 percent higher than as planned and 21 percent higher than in 1980. Its cargo transport volume was 66,000 tons, 10 percent higher than as planned and 50 percent higher than in 1980. [SK250226 Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 21 Oct 81 SK]

NEW GUANGXI RAILWAY--A new railway line between Laibin and Liangjiang has been built recently and opened to traffic. The examination shows that the quality of the railway line is up to standard. The line is 11.3 km. This line was built by the Liuzhou Railway Bureau and No 2 construction bureau of the Ministry of Railways. [HK260749 Nanning Guangxi Regional Service in Mandarin 1100 GMT 8 Oct 81 HK]

GENERAL

IMPORTANCE OF IMPORTING MANAGEMENT METHODS STRESSED

Tianjin KEXUEXUE [SCIENOLOGY] in Chinese No 4, 20 Aug 81 pp 40-43

[Article by Guo Xinchang [6753 0207 2490] and Yang Haitian [2799 3189 3944] of the Institute of Economic Research at the Tianjin Academy of Finance and Economics entitled: "Not Only Import Equipment But Also Import Management." The article was edited by Guan Xipu [7070 6007 2528] and He Zhongxiu [0149 6988 4423].]

[Text] Since 1972, we have imported whole plant equipment successively from the United States, Japan and Western Europe. This has an important significance for the level of technology and equipment in our industrial sectors. However, along with these successive investments in equipment came an extremely obvious contradiction. The contradiction is that our management methods are unsuitable for this modern equipment.

Comparison of Economic Results

First, we made the following comparison of the economic results of certain imported equipment with various domestically produced equipment. The generating equipment for the power plants at Tangshan's Douhe, Tianjin's Dagang, and Inner Mongolia's Yuanbaoshan was all imported. Except for a slight difference in the quality of the equipment for Yuanbaoshan, no technical problems occurred in transit for the Douhe and Dagang equipment (sic). The economic results of these facilities was much better than that of domestically produced facilities. The power supply coal consumption for the period January through August 1980 at thermal power plants using domestically produced equipment averaged 471 grams per kilowatt-hour. The aforementioned three power plants used 344, 350 and 367 grams per kilowatt-hour, respectively, an average of 353.7 grams per kilowatt-hour. The plant consumption rate was, in general, over 10 percent for plants with domestically produced equipment while the figure for the above 3 facilities was 6.27, 8.33, and 8.81 percent, respectively. The results for 13 large chemical fertilizer installations imported during the same period, all of which were in operation by September 1980, were all fairly good. For example, the earliest of these in operation, the Siquan plant currently consumes 40 kilowatt-hours per ton of ammonia while domestic medium-sized chemical fertilizer plants consume at least 1500 kilowatt-hours per ton. Based on 1 year's production, this one project can save more than 440 million kilowatt-hours of power. This is equal to the annual production capacity of a 50,000 kilowatt thermal power plant.

If the operating results are compared with similar foreign equipment, that is a different situation. The coal consumption for these three plants for January-August 1980 is still higher than that of the Soviet Union (1979-330 grams), Italy (1976-336 grams), and Japan (1976-337 grams). The plant power consumption rate for Douhe alone, our lowest, is still higher than that for England (1977-5.9 percent), the Soviet Union (1975-5.9 percent), Japan (1977-4.7 percent), France (1976-5.0 percent), and Italy (1976-5.8 percent). The various economic and technical targets for large chemical fertilizer plants do not completely achieve design requirements either. The power consumption per ton of ammonia was designed to be 1.97 kilowatt-hours for the U.S.-Netherlands model and we average 4.56 kilowatt-hours; the Japanese model was designed for 34 kilowatt-hours and we require 41.57 kilowatt-hours. As for long term operations, similar synthetic ammonia plants abroad run 468 days in the United States, over 300 days in India, while our longest run is 266 days.

From this it can be seen that although the results produced by the imported technology and equipment are much better than those for domestic equipment, a comparison of the operating results of our equipment with similar equipment abroad or the design requirements leaves our plants somewhat deficient. That is to say, the full potential of the equipment has not been achieved.

The Historical Problem of Imports

Why is it that the same equipment which shows good results abroad is not that effective once imported? The reason is naturally multifaceted, but the most basic reason is that our current management methods, management systems, and management structures are not adaptable to the demands of this modern equipment.

Production organization management is both the embodiment of a specific production relationship and the objective demand of a certain time in the development of productive forces. Along with scientific and technical advances, and the renewal of equipment, a corresponding reform in management methods must be carried out. Otherwise, further advanced equipment cannot be brought into full play. This point was proven abroad long ago and 30 years of experiences domestically are also sufficient to illustrate the point.

Our Ministry of Chemical Industries has imported the most equipment, the majority of which was whole plants. In general, a look at the effects and an economic comparison of equipment already on-line shows the 1950's as best, the 1960's as worst and the 1970's as relatively good. Why is this? It is common knowledge that during the 1950's our equipment was imported primarily from the Soviet Union. At that time, we had no experience managing socialist enterprises. We mostly emphasized learning from the Soviets. At the same time we imported technology and equipment. We also gave attention to importing the Soviet management methods and systems and strengthening every rule and regulation to allow this equipment to have its fullest effect on the development of our chemical industry. In the 1960's, we imported technology and equipment primarily from Western Europe. Although a comparison with the 1950's shows the technological level to be relatively high, our management methods did not change, especially after the 10 years of catastrophe began. To talk of importing enterprise management methods during the despotic rule of the extreme left was to talk of a leopard changing its spots, which led to poor economic results. In the 1980's, technology and equipment was imported primarily from the United States, Japan and Western Europe. It was naturally even more advanced, however, the management methods were still the Soviet methods of the fifties. It was only after the smashing of the gang of four that some advanced foreign management methods were imported along with the equipment. Some units which imported equipment also began giving attention to importing advanced management experiences. Although it hasn't been long since this was begun and the things learned are also one-sided, the results achieved are especially obvious. For instance, after the 13 chemical fertilizer plants came on line, a tendency for improved operations, increased production, decreased consumption and lower yearly costs was noted.

The facts fully explain that contemporary scientific technology and contemporary scientific management are the two wheels which drive contemporary economic development. If we emphasize importing advanced foreign technology and equipment while we do not import the corresponding management methods and we attempt to use the advanced technology or equipment by accommodating the traditional backwards management methods, this is the same as putting two dissimilar tires on a cart; it is very difficult for it to roll smoothly and quickly.

Manifestations of Backwards Management

The following are the four most obvious examples.

1. Workers and Staff Too Numerous

The power, chemical fertilizer, and chemical fiber plants which we imported during the seventies generally all have a single set of large-scale characteristics such as a high degree of self-control and strong continuity. An important indicator of the use of these advanced installations is a high rate of labor productivity and a small work force. For example, in the past 30 years, following the critical increase in energy resource requirements, the public power industries of many nations were swiftly expanded but the number of personnel in the work force did not increase greatly and in some cases there were even decreases in work force. Since 1951, privately managed public power companies in the United States have had only a 20 percent increase in operations and maintenance personnel. The British power industry work force has on the other hand decreased by 1/4 in 10 years. Over the past 30 years in the Soviet Union, power production and installed capacity has increased by more than 12 times while the work force has increased only by about 4 times. Looking at the power plants alone, the number of personnel used abroad is still very few. For instance, the world's largest fossil fuel burning power plant, the Kagoshima power plant in Japan, has an installed capacity of 4.4 million kilowatts with only 350 people in the work force.

The most important reason why industrialized nations are able to obtain such high labor productivity in power, chemical fertilizer and other industries is because they follow the principles of socially run plants, realizing a highly developed specialized cooperation. While our nation, on the contrary, follows the traditional method of a plant run society where specialized cooperation does not develop, even those large-scale enterprises for which modernized complete plants were imported are no exception. Therefore, the establishment of an imported complete plant results in the appearance of a "small city," which has everything it needs. In addition to those departments directly connected to production, it has a hospital, post office, stores, capital construction, motorpool, farm, child-care center, kindergarten, primary and middle schools, technical secondary schools, a hostel, and even police and fire stations. For example, in one of our power plants equipped with imported modern equipment, the work force is nearly 1,112 personnel, of which the operations personnel number 193, 17 percent of the total work force. The number of personnel in the maintenance, heat and chemistry shops is 532, 48 percent of the whole. Administration, funding and farming take 387 people, which is 35 percent of the total.

2. Non-professional Leadership and Multi-level Directions

The businesses with imported modern installations are both economic organizations of socialized production and ones which have the special characteristics of strong production continuity and a high degree of self-control. The lessons and experiences of some enterprises also show that any incidence of managerial or technical negligence, mistake or dispute can result in a mishap, creating a great economic loss, even a gross calamity. Therefore, although there are many different organizational styles in the businesses of the industrialized nations, they all have one common characteristic. That common characteristic is the use of specialists implementing highly concentrated, unified leadership and guidance. However, in our enterprises which have imported equipment, not only are factory level leading groups overstaffed with deputies but the ration of cadre who understand the technology, economics and management is not quite one in three. The number of middle level leading cadre fills even more authorized strengths and yet the number of those attaining a university or polytechnic school level is still not better than one in three. This situation of overstaffing, multiple administrative levels, and this many amateurs in the ranks of the cadre creates one of the primary causes for the numerous disputes, low efficiency, bureaucratism, misdirection, numerous accidents, and unclear lines of responsibility in our imported enterprises.

3. Low Technical Levels of Labor and First Line Management

One more important reason that the work force is small and efficiency high in similar foreign enterprises is that the scientific and technical level of labor and basic level management is high. For example, the majority of operations personnel in a power plant have all graduated from college or gone through specialized training and have attained a college level expertise. It is also necessary for support technicians and management to have a general knowledge of modern power plant production. Safety personnel are not only expert in one thing and good at many, but a lot of them are also qualified for operations positions. This is in sharp contrast to our enterprises. Take for example a certain power plant with imported advanced equipment which has an overall total of 735 workers. The average technical grade is a mere 2.79 which is lower than the national average for the industrial work force.

4. Lagging Management Methods

Modern, advanced installations demand correspondingly advanced management methods.

In the power industry abroad, large capacity units universally adopt single element concentrated control. Central control rooms monitor operations through a screen display and controllers jointly use computers. Some plants even use computers for direct control of the entire plant. The three power plants we have imported still basically use minor specialized management. Although automated control has been partially realized in control rooms, controllers are still generally in the phase of knowing something is so but not knowing why. Fuel transport still remains a mechanical or hand-operated operation.

Thus, steadfast guidelines for a small work force, high efficiency and specialized cooperation should be adopted in modern industries with imported equipment and technology. This is the correct path to resolving the contradiction of advanced equipment and backwards management practices.

The Reason Reforms Produce Deficient Results

It should be pointed out that after imported equipment is brought on line, some enterprises feel they should insist upon guidelines for high efficiency and a small work force, and they implement reforms for specialized cooperation, but the results achieved are not great. To date, there still has been no relatively successful experiences concluded.

For example, a certain chemical fertilizer plant of equipment imported from the United States was constructed and brought on line at the end of 1976, with a work force of 1,520 people. Beginning in September 1979, reforms were carried out in this plant. The maintenance and repair shop for the fertilizer plant was placed under the unified management of the general plant mechanical repair shop. The hostel, cafeteria, stores and school were returned to the plant's life services company and education office, respectively. Some administrative technical offices also carried out corresponding simplifications and the work force was reduced to 315 personnel. However, doing this for more than a year not only did not facilitate production but brought on a lot of trouble. Production not only did not increase, it showed somewhat of a decrease. There was no choice but to change it back.

Paths To Resolve the Contradictions

Since advanced equipment and backwards management is the current primary contradiction, and it has already seriously affected the economic results of the imported equipment, what is the solution? There are only two paths to take. One is to put undue emphasis on national conditions making the imported equipment adapt to traditional management. The other is to give attention to national conditions while emphasizing foreign conditions and importing scientific management at the same time that technology and equipment are being imported.

Although those comrades who support the first concept admit, in theory, to the necessity for reform of our current management methods, when met with a practical problem, they can only stress that our population is great, our foundation poor, wage levels low, and it is necessary to have a priority resolution to the employment problem. The imported modern industries are no exception. Therefore, even though the technological level of the equipment is continually increasing, the need for personnel is also steadily increasing. This is not to say that maintenance and service personnel exist in name only but that the number of production personnel are greater than those abroad. Each shift of operating personnel on a similar foreign power plant, for instance, averages 5 people (the United States is the lowest with 2-3 people). Our 3 power plants all have approximately 12 people. The operations of a urea installation requires 7 people abroad while ours requires over 10 people.

We feel, in our economic work, that there should be a high degree of emphasis on employment problems, but this is not to say that all enterprises without exception should adopt the principle of lower wages, higher employment. The majority of imported self-contained plants are in capital intensive industries for which a low need for personnel and high efficiency are characteristic. If we do not emphasize this characteristic and, even as in the labor intensive industries, implement extensive measures to lower wages, increase employment, and do all without seeking personnel, not only will the subjective initiative of the work force be affected, but the production efficiency of the equipment will decrease, and an organizational abscess may even cause delays in everything. At present, employment problems universally exist in the industrialized nations as well, but the method for resolution is not to, without exception, implement lower wages and higher employment without discriminating between the nature of industries, but rather to solve the problem in labor intensive industries and support services. A further example is a power plant which originally had a work force of more than 1,200 and which began implementing reforms in 1978. Except for maintaining the operations, coal transport, heating and chemistry workshops, it has reunified the maintenance shop, cafeteria, hostel, motorpool, and others under the control of the services company and the inspection and repair office of the main power plant. In this way, the power plant work force was reduced to 813 people and the technical offices reduced to 56 people. However, following the reforms, matters troublesome to the power plant did not decrease. The debate over responsibility for the first instance of maintenance work was disputed for several weeks. The cafeteria was not well run and the workers preferred eating at privately owned food stands nearby. The result was that the majority of staff and cadre in the plant did not approve of this reform.

If not implementing specialized cooperation is unacceptable, how is it that implementing specialized cooperation is also unacceptable? We feel that the problem lies not in specialized cooperation itself, but in the process of implementation and in overlooking some of our special conditions. Chief among those special conditions are:

1. Dispersed Distribution of Similar Businesses

The site selection for chemical fertilizer and petrochemical plants originally should have placed them in those sites which would most easily give play to economic results and distributed them in relative concentration, only then would favorable conditions be created for specialized cooperation. Furthermore, when we are establishing plants, we above all, often take into consideration political factors, even military factors, thus creating dispersed distributions. This not only created deficient economic results for some plants but also created difficulties for specialized cooperation by similar businesses. The 13 chemical fertilizer plants, for instance, were spread over the entire country on the principle of 1 plant per province. The result was that because the distance between plants was so great, it was difficult to establish specialized maintenance and service companies. It is being done with great effort and the cooperative economic benefit produced will be offset by the unreasonable transportation costs.

2. The System of Multiple Managers

For example, the four chemical fiber plants at Siquan, Changshou, Liaoyang, and Tianjin which were imported in 1972, are still under the leadership of four entities including the Ministry of Petroleum and the Ministry of Chemical Industries. The Tianjin Dagang power plant is situated in the suburbs and thus ought to be under the guidance of the Tianjin Municipal Power Bureau, but because the plant often has an oil supply crisis and the Dagang refinery generally only guarantees its customers about 30 percent, Tianjin is powerless to resolve this troublesome problem. Only if the plant is under the control of the Huabei Power Bureau can production at this plant be maintained.

3. Traditional Ideas of Large but Complete

In the past several years, due to being overly accustomed to the days of "large but complete," and not asking for help in anything, some cadre and groups feel unaccustomed to specialized cooperation. Some cadre even feel that to establish specialized companies would only relinquish the little bit of independence recently obtained, do away with the fiscal power and political institutions of the businesses, and make it even more difficult to deal with the two difficult matters of production and not having cash or party notes in hand. Thus, not long after the founding of specialized companies, some of the original institutions which had been abolished gradually returned, adjusting one group of cadre and further utilizing a group of cadre. The so-called main plants and companies only had one more administrative level.

4. Catching Up Lagging Technology

Even after the importation of advanced technology and equipment, because our industrial technology lags behind the industrialized nations by several years, it is very difficult for the laggard technology to catch up immediately. At present, the 13 imported plants have tried 1,007 domestically produced spare parts of 7,334 items. Of these there are 263 fittings in 5 key units. They have achieved pitiful results. However, when speaking of need alone, there is still some distance to go since several key fittings must continue to be imported at high prices.

5. Patching Up Old Maintenance

Developing the potential of equipment is correct, however, from the economic results angle, it is not unlimited. Because all advanced technology or equipment has its natural and economic lifespans, they will all be controlled by the fact that the new supersedes the old. In a situation where science and technology develop swiftly, when the economic lifespan is extended, the technical characteristics grow older and lag farther behind. Furthermore, when some of our businesses overemphasize developing the potential of equipment, overlooking the inexorable law of depreciation, they do everything they can to use patched up maintenance, and even if they have spare parts they are unwilling to use replacements. This inevitably causes the maintenance business to become arduous and complicated. With these ideas for guidance, after equipment is imported, each plant must put together a vast, specialized maintenance power to cope with the complicated maintenance tasks.

6. No Responsible System of Guarantee

No matter whether it is intraplant cooperation or interplant cooperation, both are economic organization forms. Only if there are explicit responsibilities, feasible economic contracts established, rules for the cooperating sides to follow and records to check after a problem arises, can this organizational form have practical significance. Otherwise, it is only a form and that's all. Many enterprises make revisions without great results and this is one main reason.

The Outlook for Future Reforms

Experiences from abroad and the lessons from our reforms both show that if the main contradiction of imported equipment and backward management is to be resolved, we must import corresponding management methods when importing equipment while resolutely following the road of specialized cooperation. It is also necessary to, at the same time, squarely face our current practical difficulties and steadily adopt diversified reforms in accordance with existing conditions and the production characteristics of the imported equipment.

An imported modern power plant has a series of characteristics such as large capacity, high degree of automation, etc. It produces an invisible product whose quality, quantity, and cost do not depend completely upon the plant itself but are controlled by materials supply and the entire power network. Thus, unified management of the network by area is the current management trend by the worldwide power industry. From our standpoint, the distribution of power plants is still fairly concentrated and providing relevant adjustments are made for the jurisdictional questions of some power plants, and providing economic legislation and contract guarantees are strengthened, then specialized cooperation between areas can be successful. For instance, there are currently five power plants in the Tianjin area whose distribution is relatively concentrated and appropriately, the Tagang power plant is the dominant one. A specialized company was established by the Tianjin Power Bureau which, first of all, through a strict system of contracts and responsibility, organized a training center for specialized maintenance companies and the power industry. They later expanded their scope steadily and when conditions were right established unified power companies in the Beijing, Tianjin, and Tangshan areas.

The large imported chemical fertilizer installations have the special characteristics of airtight cycles and continuous operations. They produce a tangible product and product quantity, quality, and cost depend mainly on the plant itself. A further consideration of the distribution of our large chemical fertilizer facilities and the specific conditions in the small and medium facilities where costs which are too high await regulation, shows that these businesses should primarily implement internal reforms first through study and importation of foreign advanced management experiences. Supportive cooperation between plants can be implemented. For example, under the unified coordination of the Ministry of Chemical Industries, interplant cooperation among the Hebei Cangzhou chemical fertilizer plant, the Shandong Shengli chemical fertilizer plant, and the Liaoning Liaohe chemical fertilizer plant could be implemented during periods of major maintenance. When one plant is undergoing major maintenance, engineering and technical strength from the other two plants could be transferred for support to fulfill responsibilities, meet schedules, and insure that the major maintenance is completed on time. This would not only benefit the training of technical ranks, solve the problem of insufficient technical strength during major maintenance but could, at the same time, also lay a foundation for later specialized cooperation.

Special characteristics of imported machinery processing equipment are single stage operations and independence. Such installations basically are labor and capital intensive type industries. While the product quality, quantity and cost depend on the technical level of labor, they also depend on the size of the labor force, the hours of labor, and the relative independence between plants. Such businesses should first implement internal reforms of specialized cooperation. For example, a plant in Xian whose major equipment was all imported from England even sent personnel to the British companies to study production organization management experiences. At present, this plant is in the midst of conducting tests on the program control of production which will, through the formulation of a program control outline for production, bring about programming for supply, production, inspection, and transportation, each of the links in the production chain, thus guaranteeing a balanced sequence in production. The tests have shown that these management methods have obvious effects on discovering hidden perils in the work and insuring product quality. It appears as though, in similar enterprises when conditions are right, further steady implementation of specialized cooperation between shops, plants and areas, beginning with internal workshop processes, is a feasible path to take under current conditions.

In summation, if we liberate thinking, are practical and realistic, boldly import advanced management methods at the same time we import advanced foreign technology and equipment; and carry out steady, diversified reforms in accordance with national conditions and industry characteristics, only then will the present contradiction of backward management and advanced equipment gradually achieve the solution of imported technology and equipment. Then and only then will even greater economic benefit be derived.

SHANXI PHONE CONFERENCE ON FINANCE, TRADE WORK

HK040436 Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 2 Nov 81

[Summary] On the evening of 2 November, the Shanxi Provincial People's Government held a telephone conference calling on all the workers on the financial and trade fronts throughout the province to enhance their revolutionary vigor, go all out, work for the benefit of the enterprises and strive to accomplish this year's financial revenue task. The conference demanded that all areas do a good job of financial revenue work. The conference pointed out: It is necessary to extensively launch discipline inspection over financial and trade work in the province in accordance with the spirit of the two circulars of the provincial people's government; also, it is necessary to carry out thorough investigations.

The conference also pointed out: "In pushing forward the implementation of the economic responsibility systems, the enterprises must handle well the relationship between the interests of the state, the collective and the individual. It is necessary to rely on the improvement of the labor productive force but not to infringe upon the interest of the state in improving the living standard of the workers." The enterprises must retain a certain portion of profits in accordance with the state's stipulation and cannot change the proportion on their own initiative. The conference stressed: "While economizing on expenses, it is necessary to strictly control all kinds of expenses. We must resolutely forbid indiscriminate distribution of money at the yearend, in particular, distribution of bonuses. We must also prevent indiscriminate raising of bonuses." Vice Governor (Wang Ji) presided over the conference and spoke. He said: "Production is the basis of financial work. We must consolidate and develop the good situation of production which has appeared since September this year and continue to promote production, providing a more substantial and a richer material basis for financial trade. We must put an end to chaotic business management and correct all ill practices in violation of law and discipline. In order to obtain economic gains, the enterprises must rely on improving business management and improving the economic results." In conclusion, Comrade (Wang Ji) urged financial departments and banks at all levels to accomplish their tasks in order to promote work in an all-round way.

TIANJIN ENCOURAGES URBANITES TO MOVE TO SUBURBAN AREAS

SK310924 Tianjin City Service in Mandarin 1430 GMT 30 Oct 81

[Excerpt] According to our sources, a spokesman of the Tianjin Municipal People's Government has released a white paper on giving equal treatment to those who move from urban areas to new suburban residential quarters.

He said: The new residential quarters in Tianjin's suburbs, including (Dingzigu),(Beicang), (Miyunlu), (Changjiangdao), (Tiantenan), (Tiyuanbei), (Xiaohaidier), (Zhujiangdao), (Xinlicun), (Zhenlidao) and (Jiankangdao), will soon be completed. To solve the housing problem of earthquake victims, encourage the victims to move to new residential quarters and facilitate the dispersing of the urban population, the 49th meeting of the Standing Committee of the municipal people's government, which was held 23 October and presided over by Mayor Hu Qili, set forth the following stipulations:

First, those who move from urban areas to the new residential quarters will remain registered as urban residents. They will be guaranteed the freedom and the right to move back to urban areas in accordance with their needs.

Second, the supply of rationed daily necessities and commodities for everyday use to new residential quarters will be guaranteed. As for the supply of commodities in short supply, priority will be given to new residential quarters.

Third, in schooling and employment, children of residents in new residential quarters will be treated equally as urban residents.

Fourth, public transportation in the new residential quarters will be designed in the interest of the masses. Every new residential quarters must open direct bus lines to urban areas to ease passenger transfers.

CSO: 4006/87

BRIEFS

CHENGDU FINANCE, TRADE CONFERENCE--He Haoju, secretary of the provincial CCP committee, spoke at the provincial work conference on finance and trade. Comrade He Haoju said: The peasants are enthusiastic in selling agricultural sideline products to the state. However, we must pay attention to questions concerning procurement, allocation and transference of agricultural sideline products after multichannel business undertakings and profit-contract systems and award systems have been carried out. We must understand that whether or not we have fulfilled the procurement, allocation and transference of the state's quota is an important issue which relates to the implementation of the state's discipline in financial and economic affairs. To enliven the economy, we must practice multichannel business undertakings. However, the CCP committees at all levels and the people's government must strengthen leadership over procurement, allocation and transference of agricultural sideline products so as to guarantee fulfillment of the state's plan. After the management responsibility system has been practiced, apart from economic interests, the management departments should also consider economic effects and the interests of producers and consumers. [HK161300 Chengdu Sichuan Provincial Service in Mandarin 2300 GMT 12 Oct 81 HK]

GOODS IN STOCK--Beijing, 4 Nov (XINHUA)--Since the beginning of this year, many areas and departments in China have made use of goods kept in stock. According to incomplete statistics, 10 areas including Yunnan, Shanghai, Hebei, Henan, Heilongjiang, Gansu and Guangxi and 23 central government departments including the ministries of metallurgical industry, railways, petroleum industry and electric power industry and the seventh Ministry of Machine Building had utilized goods in stock with a total value of 1,407 million yuan in the first half of this year. The goods so utilized included 384,000 tons of rolled steel and machinery and electrical products valued at 902 million yuan. [Beijing XINHUA Domestic Service in Chinese 0035 GMT 4 Nov 81 OW]

INDUSTRY

STEEL MILLS COMPETE FOR EXPORTS TO HONG KONG

HK020146 Hong Kong SOUTH CHINA MORNING POST in English 2 Nov 81 Business News Supplement p 1

[Article by Nigel Gibson]

[Text] An export campaign by China's steel mills is putting mounting pressure on Hong Kong manufacturers who are already reeling from a strong U.S. dollar and rising production costs.

Prices for rolled steel bars--a staple ingredient for the construction industry--have tumbled to the lowest level for nearly a decade here as mini-mills in China have taken the unprecedented step of competing among themselves for a slice of the local market.

The strain on Hong Kong steel mills has also been highlighted by China's decision to step up its exports ofhigh-tensile bars in addition to existing supplies of mild, or softer, steel rods.

According to Shiu Wing Steel, the largest manufacturer here with a 35 percent market share, competition has reached "cut-throat" proportions with the prospect of little relief next year when demands is forecast to shrink by about 15 percent.

The company's executive director, Mr Harry Pong, estimated that profit margins could be even tighter during the first half of next year as contracts engaged 2 or 3 years ago start to dry up against a background of cheaper imports from China.

"At current levels, no one, not even China, is making money," he said.

Although precise figures have not been released, it is estimated that China is currently exporting between 30,000 to 40,000 tonnes of steel rods a month to Hong Kong. Roughly half of this is high-tensile.

In value terms, total imports, including those from China, of all iron and steel bars and sections rose just over 11 percent to [Hong Kong $988.5 million till July this year, compared with [Hong Kong] $890 million during the same period last year.

China Resources Ltd, the main outlet for China-made steel, is quoting about [Hong Kong] $1,440 per tonne, roughly [Hong Kong] $100 per tonne lower than Japanese and Taiwanese exporters, while local mills are caught like a vice between the two.

Other major importers like South Africa have also been forced to slash prices.

Price-cutting by China has caused Japanese exporters, who last year supplied 200,000 tonnes of high-tensile rods to the Hong Kong market, to cut back exports drastically.

Falling demand, both at home and overseas, has already forced Japan's minimills to cut output by more than 30 percent.

According to a spokesman from Marubeni HK Ltd's metals division, prices for steel rods are almost certain to fall further before the end of the year.

He estimated Japan's exports to Hong Kong for this year could be 50 percent down on last year's total.

"So far this year, we haven't taken a single order for steel rods from Japan," he told BUSINESS NEWS.

China's determination to win a larger share of the local market for high-tensile rods--it already controls 90 percent of imports for mild steel--has caused minimills there to export direct to Hong Kong customers, cutting out traditional agents.

"They are literally falling over themselves to supply. In the past, they would sell through a single source like China Resources. Now shipment advice comes from China Resources, mills and other sources," explained Shiu Wing's Mr Pong.

'JINGJI GUANLI' ON LEARNING FROM ADVANCED UNITS

HK291410 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 81 pp 3-6

[Article by Xu Yunbei [1776 6663 0554]: "Learn Advanced Experiences, Strive to Improve Economic Effect of Light Industrial Production"]

[Text] In responding to the call of the 6th plenary session of the 11th CCP Central Committee, the broad mass of staff and workers of light industry, proceeding from reality, are earnestly learning from the advanced experiences of Shanghai with full confidence in victory. They are unremittingly improving the levels of technology, administration and management, and vigorously developing the production of consumer goods, so as to make new contributions in constructing a modernized, highly democratic and powerful socialist country with high-level civilization.

As pointed out by Premier Zhao Ziyang in the plenary meeting of the State Council, the way to get rid of the present economic predicament lies in the improvement of the economic effect; we rely in the first place in readjustment and in the second on reform. Readjustment and reform will enable the national economy to develop harmoniously and grow steadily, and to achieve a healthy cycle. From now on, in developing the national economy, we will no longer depend mainly on establishing new plants and expanding the scale of capital construction, but on giving play to the existing enterprises. We must make every effort to tap the latent power of these enterprises. On the other hand, Premier Zhao Ziyang pointed out that one of the practical ways to improve industry in the interior and tap its latent power is to learn and borrow advanced management and administration experience and technology from coastal areas, in particular Shanghai. This has shown us the direction and significance of learning advanced experiences.

Far back in the 1950's, the light industrial trades began to carry out activities of learning from the advanced experiences of Shanghai under the leadership of party committees and governments at different levels. Since the third plenary session, particularly this year, there have been new developments in the activities of learning from Shanghai, coastal areas and advanced units under the call put forward by the leading comrades of the party's central authorities for transplanting the advanced experiences of Shanghai. In provinces and cities such as Hubei, Tianjin, Jiangsu, Sichuan, and so on, activities of this kind are developing in span and in depth. In the past few years, in organizing such activities, some good ways have been invented and fine effects have been achieved in different areas. Quite a lot of enterprises in trouble have changed their situation and caught up with advanced units. Some units already graded as advanced ones have narrowed the gap between them and Shanghai. In the meantime, Shanghai and other coastal areas have also learnt useful experiences from the interior.

According to the experiences of different areas, the following problems should be emphatically solved in learning from the advanced experiences of Shanghai.

1. Enhance Understanding and Intensify the "Three Learning" Activities

Industrial cities such as Shanghai, Tianjin, Guangzhou, and so on possess a lot of advantageous conditions since their light industrial production has been developed quite early. Among them Shanghai is the most outstanding one which, being the oldest and largest industrial base in our country, has a history of light industry of more than 100 years. Shanghai is also an important base for scientific research and export, which produces many famous-brand products and keeps an advanced level in production technology and in management and administration in the country. The leading cadres of the State Council have pointed out that importance must be attached to key cities and famous-brand products in developing the consumer goods production in our country. By and large, Shanghai is maintaining a high level of coordination between specialized departments, it is advancing in a well-oriented production direction and possesses an advanced technological contingent, well transformed equipment, a high level of administration and an agile information network. Thus it can produce a vast variety of products of high quality which, being strongly competitive, can enliven the market and achieve a great economic effect. According to statistics made by the Light Industry Department, in 1980, the able-bodied productivity in Shanghai was higher than the average level of the whole country by 194.73 percent; the output value derived from every 100 yuan of fixed assets in Shanghai was higher than the average level of the whole country by 120.82 percent; the profit produced from every 100 yuan of output value in Shanghai was higher than the average level of the whole country by 107.72 percent. If the light industrial trades in all major cities throughout the country can attain or approach the level achieved by the same trades in Shanghai, the output value and the tax income will be greatly increased, with the fixed assets remaining unchanged, in other words, without investment from the state. Therefore, learning from Shanghai, coastal areas and advanced units is a shortcut for developing light industrial production.

The economic organizational structure, production technology, and management methods of Shanghai have incorporated advanced components originating from abroad while embodying good experiences of our own. Therefore, learning from Shanghai is more practical and effective than learning from foreign countries. At present, in further readjusting the economy and vigorously promoting consumer goods production, to transplant the advanced experiences of Shanghai is an act of practical significance to further organizing production and integration, tapping the potential of the existing enterprises, improving labor productivity and the economic effect, and enhancing the development of light industry. In this sense, the immediate purpose of the "three learning" activities is to enhance the rapid development of light industry in the interior.

In the future, the economic construction of our country must follow a new path which takes intension and expanded reproduction as the dominant factors. We should mainly depend on tapping potential, renovation and restructuring of old plants to make them keep on attaining a new level of technology. Therefore, learning from Shanghai, from coastal areas and from advanced units are definitely not provisional measures or merely a general problem concerning the working means, but a strategic problem concerning giving full play to the superiority of the socialist system, upholding the guideline which mainly stresses the principle of self-reliance, unremittingly satisfying the needs of the broad masses of the people, better promoting the production of consumer goods and achieving greater, faster, better and more economical results in developing our country's light industry.

While the whole country is learning from Shanghai, coastal areas and advanced units, Shanghai and coastal areas also have to learn useful things from the interior, as well as advanced technology and administrative experience from foreign countries, and conscientiously overcome their own shortcomings and weak links, so as to enhance the quality and variety of products, administration and technology to a new level. So, with Shanghai bringing along the interior and the interior in its turn pushing Shanghai, both are closely linked together to unremittingly raise our country's light industry to a new level through the activities of learning from and helping each other.

2. Learn How to Enhance the Management, Technological and Administrative Level of Light Industry and Improve the Quality of Products and Economic Effect

Indeed we can learn a lot of things from Shanghai. But, in doing so we must grasp the key link.

First of all, we should learn from the proletariat of Shanghai their glorious revolutionary tradition and pioneering spirit of arduous struggle. The Shanghai proletariat have accumualted rich experiences in the anti-imperialist antifeudal struggles over a long period of time. They have a high political consciousness, with a good working attitude and strict working discipline. Confined in small and narrow factory buildings, they create wealth for the people and society, unremittingly surmount technical difficulties and strive to attain new technological heights, while making nothing of hardship. In carrying out the "three learning" activities, we must strengthen ideological and political work again and again, and integrate it with production activities. With the Shanghai proletariat as our model, we must enhance the political consciousness of the broad masses of staff and workers, give full play to the role of the proletariat as masters and thus make new contributions to light industrial production.

In the second place, we must learn from Shanghai advanced technology. Science and technology are productive forces. With rich technological forces, Shanghai has closely integrated scientific research with production, and the introduction of new technology with self-innovation. They have actively adopted new technology, unremittingly renewed old equipment, transformed old enterprises, and kept on raising the productive technological level. In carrying out the "three learning" activities, we should learn their experiences in attaching great importance to the promotion of technological work and advanced technology, strengthening the fostering of technological contingent, giving full play to the role of technological personnel and unremittingly raising the technological level.

Moreover, we must learn advanced management experience from Shanghai. At present, if we consider the light industrial enterprises in the whole country, the standard of enterprise management is generally quite low and does not conform to the needs of production development. Shanghai has accumulated over the years a whole set of scientific management experience which is outstandingly displayed in some aspects we are going to mention below. They have conscientiously done the basic work for enterprise management. In paying attention to market investigation, they have managed to readjust unremittingly the product structure and technological structure according to the changing needs; they have promoted famous-brand and high-grade production, improved the quality of products, and caught up with or even surpassed the advanced level at home and abroad. They have paid attention to economic accounting and economic effect. In some other regions, some enterprises used to carry out the work before completing cost budgeting; but in Shanghai, they never follow such old practices. In the meantime, they really care about the fostering of qualified personnel and the exploitation of intellect.

Enterprise management work must be consistent with the level of development of the productive forces. Over many years, Shanghai has upheld the principle of "quality first." Taking quality control as the key link, they started from basic work to strengthen management work of production, technology, fin ance, labor, operation, and so on, and have unremittingly raised the level of production technology. Since 1979, comprehensive quality control, overall economic accounting and the training of able-bodied laborers have been carried out, the economic responsibility system has been vigorously enforced, various forms have been adopted to integrate economic responsibility, economic effect and economic profit. So the initiative of enterprises and staff and workers has been mobilized. The job technology responsibility system is a form of responsibility system. There are both job responsibility systems for workers and for cadres. Under these systems, everyone in an enterprise can exercise his own power, fulfill his own responsibility and act according to regulations. Hence, the enterprise can be turned into a complete and well organized production and labor collective. In realizing the improvement of quality, quite a lot of units have solidly organized comprehensive experiments of quality control in appointed workshops, teams or groups according to their own conditions. In enforcing economic accounting, the economic accounting system headed by accountants has been set up, and those unified fixed amount systems concerning matters such as raw material consumption and capital expenses, and so on, have been worked out. Many trades have set up unified procedures for cost accounting. Some enterprises have practiced trilevel administration and bilevel accounting; some other enterprises have enforced trilvel accounting and the cashier's cheque system, and have thus incorporated the masses in the accounting and made the system more complete with all aspects of targets, assessment, analysis and announcement considered.

In brief, in the "three learning" activities, we must enhance the levels of management, administration and technology through learning from the revolutionary spirit, advanced technology and administrative experience of the Shanghai proletariat.

3. In Learning Advanced Experience, We Must Proceed From Reality, Take Various Flexible Measures, Proceed in an Orderly and Gradual Way, Use the Experience of Selected Points to Promote the General Situation and go for Gradual Improvement; That is, We Must Use the So-called Climbing Upstairs Style of Learning.

As the conditions in various areas and enterprises are different, our way of learning must be flexible and varied. In some cases, we can send people out to learn from other units; in others, we can invite experts from advanced units to teach. We can even adopt the forms of fixed technical cooperation or joint operation. Practice in different areas has proved that the form of joint operation between coastal areas and inland enterprises is an efficient form to helping and learning. Shanghai must establish as soon as possible economic technological advisory service companies to provide information to various areas and help to train technical management personnel. Key cities in various areas should also establish step by step and as soon as possible advisory service companies or technology popularization centers according to their own specific conditions. At the same time, the Light Industry Department should also play a role in organizing and coordinating this work, so as to strengthen the interflow of experience in the "three learning" activities and provide information to units concerned.

In carrying out the activities of learning from Shanghai, coastal areas and advanced units, we must also do a good job of combining it with the following practices.

1) Combine the activities of learning advanced experience from other places such as Shanghai and coastal areas with those of learning from local units. Here what counts is the selection of key points, including key enterprises, key products, and so on, and the popularization of the experiences of selected units to promote work in the entire area. In Jiangsu Province, areas along the Shanghai-Nanjing Railroad and the Changjiang River where industry has been developed generally take Shanghai as the target to keep up with; while the region of Xuzhou and Huaiyin in northern Jiangsu generally take first southern Jiangsu and then Shanghai as the targets. They have classified those enterprises and arranged them in order. There are three types: the enterprises of the first type take Shanghai as the target to keep up with; those of the second type take the advanced units of the province as the target; while those of the third type are to undergo rectification and required to get rid of their backwardness within a fixed period. After deliberation, the Light Industry Bureau of Sichuan Province has recently adopted the way of "key cities learning from Shanghai, other cities learning from Chongqing, and all cities learning from advanced units in a unified way." Having selected 12 "dragon heads" among enterprises in Chengdu and Chongqing to learn from the advanced experiences of Shanghai, they held training classes in every trade to pass on experiences stage after stage and group after group, and organized enterprises in the two regions to learn from those "dragon heads." In the meantime, other cities are encouraged to learn from Chongqing. So, they have integrated the activities of learning from Shanghai and coastal areas with those of learning from Chongqing and advanced units, activating internal factors with external factors, popularizing the experiences of selected units among entire areas, proceeding in an orderly way and step by step and guarding against precipitate action.

2. The activities of "three learning" must be integrated with the activities of learning from advanced teams and groups, mechanized units and individuals inside

an enterprise. We must select at first in every plant some key mechanized units and individuals as models for learning from Shanghai, coastal areas and advanced units; then popularize their good experiences to the whole plant and amplify the results of learning from advanced experience.

3. The activities of "three learning" must be integrated with developing famous-brand products. All regions have their own famous brands, and we must take creating famous brands as one of the targets of "three learning" and push ahead with developing these products. At the same time, we must strengthen the integration between Shanghai, coastal areas and the interior, centering around famous-brand products.

4. The activities of "three learning" must be integrated with the rectification of enterprises. All enterprises which remain unrectified must undergo rectification in learning from Shanghai, coastal areas and advanced units. The rectification of enterprises must be concentrated on the improvement of management and administration and the enhancement of the economic effect. A strict economic responsibility system must be set up, labor discipline must be enforced, the principle of distribution according to work must be conscientiously carried out, and the practices of egalitarianism and "eating out of a big pot" must be eliminated.

4. Correct Economic Policies Must Be Adopted in the Activities of "Three Learning" to Ensure the Implementation of the Principles of Voluntary Participation and Mutual Benefit.

In order to succeed in learning from Shanghai, coastal areas and advanced units, we need to mobilize the initiative of four aspects: the initiative of the related departments and enterprises of the supporting areas; that of the staff and workers of supporting enterprises; that of the related departments and enterprises of supporting areas; and that of the staff and workers of supported enterprises. On the one hand, we must uphold ideological and political work, strengthening the overall point of view and giving full play to the spirit of socialist extensive cooperation. On the other, we must implement the principle of voluntary participation and mutual benefit, those who learn have the right to choose and those who help should not be loaded with extra burdens. Only in this way can the activities of "three learning" be carried out in depth and be sustained. For the transfer of possession of technology, we must work out the way to solve the problem of patents, which should encourage technological innovation and invention as well as push ahead the adoption and popularization of new technology. Economic compensation must be made for technological support and administrative service. An appropriate administrative service charge or technical service charge should be paid to supporting enterprises by those loss-suffering enterprises which have received support and therefore managed to effectively cut their losses. For those enterprises which succeed in turning losses into profits with the support of others, a certain proportion can be drawn from the surplus profit they have made as a service charge. For those enterprises which originally did not suffer from losses, and have succeeded in improving economic effect with the support of others, a certain amount of service charge can be drawn from the increased portion of profit. Economic compensation should also be made for single items of technological support. How great a proportion should be drawn as a service charge should be set down through bilateral negotiation according to the degree of difficulty and the value created. As for the distribution of service charges, apart from a small portion handed over to the financial and responsible departments of the state, the greater portion should be retained in the enterprises which have rendered service so as to mobilize the initiative of the supporting enterprises and their staff and workers in popularizing advanced techniques and management and administration experiences, to develop light industrial production and increase financial revenue.

5. Strengthen Leadership and Set Up a Fine Style of Study.

To learn advanced experiences from Shanghai, coastal areas and advanced units is a long-term task for the light industrial front. Therefore, it is necessary to set up a fine style of study, a good habit of earnestly learning from coastal areas and advanced units. We should draw lessons from the leftist mistakes made in the past, under the influence of which we used to launch political movements in dealing with economic problems, and practiced formalism and precipitate actions regardless of the objective conditions. In order to carry forward the party's style of study which integrates theory with practice, we have to be practical and realistic, proceed from the actual conditions of our own area and enterprise, work conscientiously and efficiently and get rid of the boastful practices of hue and cry. In the course of learning, we must learn how to handle things according to the laws of economics, learn business administration and raise the administrative level. We must learn technology and enhance the technological level according to the technological characteristics. We must follow the mass line, mobilize the masses, depend on them in doing painstaking ideological and political work, strengthening education, raising their consciousness and giving full play to the broad masses of staff and workers' sense of being masters. In coping with economic, technological and scientific research problems, we must uphold the scientific attitude, studying hard and carrying on experiments repeatedly. What we need is not impetuosity and recklessness but initiative. We surely have to set up a fine style of study in the economic field so as to enable the activities of "three learning" to develop healthily.

All light industry departments have to put the task of "three learning" on the top of the agenda. The major leading comrades of each department must look after the task personally. This year and next year, the Light Industry Department is planning to place stress on the helping and learning activities in the production of those key products such as bicycles, sewing machines, watches, paper, cigarettes, beer, white spirit, pottery and porcelain, thermos bottles, machinery for light industry, washing powder, plastic sandals and slippers, imitation leather, furniture, garments, leather shoes, carpets, electric fans, refined salt, and so on. The helping and learning activities are to be organized according to the conditions of different trades and products. The helping and learning relations already established between different areas, and Shanghai and coastal areas, must be strengthened. Authorities of different provinces and cities, and all light industry departments, must work out their plans according to their own conditions, strengthen leadership and conscientiously further promote the activities of "three learning" under the unified leadership of local party organizations and governments.

The activities of learning from the advanced experience of Shanghai, coastal areas and advanced units are aimed at promoting light industrial production. These activities must be closely integrated with, and carried out in, production. The situation of light industrial production is good this year. The leading cadres of the State Council have personally taken care of the production of consumer goods; this has greatly encouraged the vast masses of staff and workers on the light industry front. The party committees and governments at different levels have instrengthened the leadership over light industry, and continued to carry out the principle of "six priorities," while different departments concerned have also supported light industrial production in various ways. Conscientiously carrying out the guideline of readjustment of the national economy and vigorously increasing the production of consumer goods which are marketable and in short supply, light industry departments and enterprises in different areas have achieved fair success. In the activities of "three learning," we must work ceaselessly and unremittingly to further enhance production under the inspiration of the spirit of the sixth plenary session. We must adjust the product structure all the time according to the changing market, and try our best to increase the production of commodities which are in short supply. Some enterprises which originally served large-scale industry and now have inadequate production tasks must be given a new service direction, and turn as soon as possible to production of consumer goods demanded by the market. Some enterprises which originally produced products for export and now have inadequate production tasks must turn to production of commodities demanded by the domestic market. We must also pay special attention to the production of small commodities, help the enterprises which produce these commodities in terms of taxation, loans, raw materials supply, selling price, and so on. We must face up to the rural market, and be aware of its changes so as to do a good job in arranging the production of consumer goods demanded by 800 million peasants and distributing light industrial products to the rural areas. We must conscientiously carry out the principle of "quality first," strengthen quality control, unremittingly improve the quality of products, integrate quality assessment with practices of rward: all those who fail to meet the quality norm will not receive rewards. We must also strengthen the technical training of staff and workers. Moreover, some enterprises should enforce enterprise rectification which takes the improvement of management and administration as its key task. All leading teams which are disconcerted and lax in morale must be conscientiously amplified and readjusted. While strengthening democratic management through rectification, we must establish and amplify the system of staff and workers' congresses and give full play to the initiative of workers inspired by the sense of being masters of their own house. We must set up and amplify the economic responsibility system through rectification, systems such as piece rate rewards for production in excess of the quota, piece rate wages, the job contract system with floating wages, the system of taking full responsibility for profits and losses, and so on. These measures can be implemented on a trial basis according to the conditions. We must strengthen the economic accounting system, rectify financial management, enforce financial and economic discipline, do our best to increase revenue and reduce expenditure, lower consumption and raise the profit rate, and strive to fulfill or even overfulfill this year's plan to increase production and income.

'JINGJI GUANLI' ON ENTERPRISE REORGANIZATION

HK101424 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 81 pp 33-35

[Article by JINGJI GUANLI reporter: "The Urgent Task on Hand Is to do Well in Enterprise Reorganization"]

[Text] Recently the State Economic Commission convened, in Beijing, a group discussion meeting on enterprise reorganization. The meeting conveyed the directives of the leading cadres of the State Council on the topic. It exchanged the advanced experiences of the various localities on enterprise reorganization and improvement of enterprise management and control, suggested the standard or criterion for reorganization and discussed what principal work has to be grasped in the current reorganization of the enterprises.

Since the 3d plenary session of the 11th CCP Central Committee, the implementation of the eight-character policy of readjustment restructuring, reorganization and upgrading, the expansion of the decision-making power of the enterprises and putting into full play the function of regulation by market mechanism under guidance of the state plan have given the enterprises new vitality and improved their awareness of doing a good job of reorganizing. The enterprises have generally achieved good results in such aspects of work as improving the economic results, continuing to grasp reorganization and construction work, and promoting all-round quality control, business accounting and training of personnel. Unfortunately, the development of the reorganization work is still very much unbalanced. Taking into account the present basic condition of the enterprises, we still cannot give too high a rating to the results of our work done in enterprise reorganization. According to an analysis made by Beijing Municipality covering 893 enterprises under its 12 bureaus of industry, the distribution in the rating of the enterprises was as follows: 1st rate, 27 percent; 2d rate, 65 percent; and 3d rate, 7 percent [total of 99 percent as published]. A similar analysis made in Tianjin Municipality on 634 enterprises under its five industrial bureaus produced the following results: 1st rate, 16.3 percent; 2d rate, 70.5 percent; and 3d rate, 13.2 percent. In Sichuan Province, the results found from an analysis of 1,293 enterprises were as follows: 1st rate, 26.8 percent; 2d rate, 58.7 percent; and 3d rate, 14.5 percent. Although the criteria used in rating were not exactly the same among the localities, we still can conclude from the number of 2d and 3d ratings the following observations: the leadership groups of a considerable number of enterprises still cannot meet the demands of the current new situation; many of the enterprises still neglect ideological and political work and fail to grasp firmly the training of their work teams; many enterprises do not perform their basic work in a down-to-earth manner, the standard of their management is low, consumption of materials high and there is much waste and extravagance and poor economic results; some of the enterprises have such symptoms as confusion in management work, lax labor discipline, substandard products but high production costs, increased deficits and even the making of false reports and violation of the general economic code. It is clear that failure to solve these problems will be extremely disadvantageous to putting the enterprises in good order, to maintaining a steady growth of our national economy, and stepping up our economic readjustment.

Enterprise reorganization is the most practical way to tap the hdden potential of the enterprises, to improve the economic effects, to increase receipts and to reduce financial difficulties. On a long-term basis, we must take a new road in economic construction. Hereafter, in developing the national economy, we cannot rely mainly on building new plants or expanding the scale of capital construction, but must rely on putting into full play the capabilities of our existing enterprises. If we do not do well in reorganizing work, relying on the existing structure would just be empty talk. Hence, doing a good job of enterprise reorganization is at present an important and urgent task in our industrial and communications set-up.

Enterprise reorganization must aim at certain objectives. It must be directed at the existing problems of the enterprises. The work must be done in a down-to-earth manner. Formalism must be absolutely avoided. At the group discussion meeting, the reorganization targets were set down as follows:

1. An enterprise must have a leadership group which has the following four basic qualities: correct party demeanour, able to unite together in tackling problems, resourceful and capable, young in age and energetic. Both the factory director and vice director must be well versed in production technique and be knowledgeable in business management.

2. A healthy factory director responsibility system and a system of workers' and employees' representative assemblies, both to be under the guidance of the party committee, must be set up. Guidance from the party committee must be forceful, the employees' democratic management work must be of high calibre, and there must be high efficiency in directing production and administration.

3. There must be a working team which is high in consciousness, good in technique, well-disciplined and well-behaved.

4. A responsibility system at various levels must be instituted. Basic management work must be comparatively speaking, perfect. There must be good results in such work as quality control, business accounting and training of personnel.

5. There must be fulfillment of the state plan's principal technical and economic targets of quantity, quality, production cost of products and profits. They must approach or equal the advanced level of contemporaries in the province, municipality or autonomous region.

6. Improvement must be made in group welfare work and in the material and cultural life for the workers and employees.

The group discussion meeting suggested the following main points in enterprise reorganization work:

First, thoroughly reorganize and build up good leadership groups for the enterprises.

The above are the key to enterprise reorganization work. Leadership organs of the enterprises and the enterprises themselves must proceed in a planned and methodical manner in organizing and readjusting the leadership groups of the enterprises. This year, work must first start on the leadership groups of the large and medium-size enterprises. The target set is that among the leadership groups of these enterprises, at least over 50 percent of the cadres must be well versed in production technique, must be good in business management and must be young and energetic. In the course of the readjustment, the capability of the leadership cadres must be earnestly examined, the policy of weeding out and retiring aged cadres must be further implemented and we must eliminate all those elements who were former followers of Lin Biao and "the gang of four" and are still retained in the leadership groups, or who are seriously inclined to ideologies of factionalism and are smash-and-grab elements.

In the course of reorganizing and building up the leadership groups, there must be a clear-cut demarcation of work between the party and the government. The plant directors must be fit and capable. They must be allowed to effectively exercise their power of directing production and administration, and must be given full authority in production administration and in management of the enterprises.

The work of readjusting and rebuilding the ideologies of the leadership groups must be well grasped. We must pay attention to cases of certain cadres being spiritually depressed or whose ideologies are ossified. Good party demeanor must be emphasized. The guiding thought in enterprise management should stress the importance of correctly handling the interest relationships between the state, the enterprise, and the staff. We must firmly resist the tendency of selfish departmentalism, which disregards the interests of the state and converts public interests into private interests.

Second, set up a healthy economic responsibility system and carry out well the principle of distribution according to work.

We should start with the setting up of an economic responsibility system in enterprise reorganization work and in this way improve enterprise management and control and overcome egalitarianism in the relationships between the state and the enterprises and in the internal distribution within the enterprises. Industry will have no future if egalitarianism is not severely dealt with. On the contrary, making an enterprise implement a system of economic responsibility toward the state and also implementing an internal economic responsibility system can better combine the interests of the state, of the enterprise and of the individual worker or employee. It will bring into full play the socailist activism of the enterprises and their workers and employees. This is indeed a powerful economic motive force for enterprise reorganization. As for the form of the internal economic responsibility system of the enterprises, it should be determined in accordance with the concrete conditions of the enterprise and the actual effects. We should probe the matter thoroughly and should not rush into a decision. At the same time, we should not follow a set pattern, as it is entirely possible that more than one form may be adaptable within one single enterprise.

Third, thoroughly reorganize the basic lines of work and actively promote all-round business accounting and quality control.

A problem which stands out in enterprise management at present is the weakness in the basic aspects of work. For certain of the enterprises, such symptoms as the unstable quality of the products, high consumption rate, enormous waste, and poor economic results may all be attributed to this factor. Failure to solve this problem will make the institution of an economic responsibility system or the implementation of business accounting just empty talk. The discussion meeting suggested that within this year and next we should take grasping of the basic work in enterprise management as a vital task. First of all, we should review and put in order one by one such aspects of work as those concerning records, statistics, measurement, inspection, labor quotas, quantity of materials used, in particular, energy consumption, and so on.

We must combine all-round business accounting with the institution of an economic responsibility system. By means of all-round business accounting, an enterprise should be able to bring about the correct combination of the economic capacity, economic responsibility, economic effects and economic interests of each and every one of its economic units and staff members.

We must continue to promote all-round quality control and strive to improve the quality of the products. Those enterprises finding deterioration in the quality of their products must correct this as soon as possible. All enterprises must be governed by the thought of quality first and responsibility to the users and gradually set up a system of "quality guarantee."

Fourth, strengthen ideological political work and do a good job of training and improving the ranks of the workers and employees.

In training the workers' ranks, we must start with strengthening the four basic principles of observing discipline, being law-abiding, fostering a spiritual and civilized education, and a high ideological consciousness. These must be combined and must progress in a planned manner with two other phases of work, namely, training and cultivating the workers and improving the quality of technology and business. At present, we must study and firmly implement the spirit of the 6th plenary session of the 11th CCP Central Committee, improve our understanding, augment our unity and make the cadres and the populace take the interests of the whole into account, enhance their enthusiasm, obey labor discipline and perform their job well.

Fifth, strengthen democratic control.

All enterprises should earnestly carry out the directions of relevant directives from the central government, fuoly arouse the enthusiasm of the extensive masses of workers and employees as masters of their own house, and firmly protect their democratic rights.

Sixth, firmly enforce financial and economic discipline.

The enterprises must work hard toward the goal of improving management and control and improving the economic effects. They must use upright methods and upright tactics to pursue upright interests. At present, certain enterprises are still inclined to such practices as concocting various pretexts with dubious motives, wantonly granting awards, converting public interests into private interests and damaging public interests to fatten private interests. Some violate financial and economic discipline, retain remittances to the state or reciprocally detain or delay payments to each other. Some even evade taxes. Such improper practices and tendencies to departmentalism must be firmly rectified. Leadership organs at various levels should firmly protect the legitimate interests of the enterprises. The enterprises themselves are entitled to resist any kind of unreasonable extortion or demand.

At present, many advantageous conditions exist for doing a good job of enterprise reorganization. The "Resolution on Certain Historical Problems Since the Founding of the PRC" adopted at the 6th plenary session of the 11th CCP Central Committee provides powerful political power for carrying out the various kinds of work in connection with enterprise reorganization, while implementing the economic responsibility system provides an economic motive force for enterprise reorganization. In the various areas, districts and departments there are many advanced enterprises whose successful experiences are well worth copying. Therefore, if only the party committees and people's governments at various levels and the various levels of leadership organs can earnestly strengthen their concrete guidance over this work and if the extensive masses of workers and employees of the enterprises can exert their efforts, it is certain that we can achieve even bigger and better results.

PLANNED PRODUCTION, UNPLANNED PRODUCTION

HK021502 Beijing JINGJI YANJIU in Chinese No 9, 20 Sep 81 p 3-9

[Article by You Lin [2589 2651] of the Research Office under the Secretariat of the CCP Central Committee: "Planned Production Is Primary, Free Production Is Supplementary"]

[Text] In 1956, a year when China' socialist transformation of private ownership of the means of production was basically completed, comrade Chen Yun made the following suggestions on improving China's production plans: "The major part of industrial and agricultural products throughout the country are produced in a planned way but at the same time, some of the products are produced freely according to market conditions and within the limits permitted by state planning. Planned production is the major part of industrial and agricultural production while free production according to market conditions and within the limits permitted by state planning is a supplement to planned production." Earnestly studying comrade Chen Yun's suggestions is of great significance in exploring how to reform China's planning management system and how to treat the regulation by market mechanism in a planned economy. In my opinion, the above-mentioned suggestions are applicable today and will be so for a considerably long period of time in future.

I. Planned Development Is The Basic Characteristic Of The Socialist Economy

Any society must regulate production through the distribution of working time. But it is only when the society has entered the state of socialist society that it can regulate production conscientiously and the social economy can develop a planned way as a result.

In the course of commodity production based on private ownership of the means of production, the necessary relations between different commodity producers are indispensible conditions for the normal progress of social production. However, private ownership separates the relations and only through the exchange of labor products on the market can these kind of relations be established. The producers lose their power of control over social relations in this respect. The distribution of social labor in various departments is entirely at the mercy of the regulation by market mechanism. Specifically speaking, when much labor is poured into the departments, their products will go down in price or even not sell well and then social labor will move on to opposite departments. After a certain period of time, the social labor, in the departments it flowed into, will become excessive and it will again flow into other departments. Thus people turn around blindly in the wake of the market. In the course of suffering continuous damage, the minimum proportional relations of the social economy are maintained.

After the capitalist mode of production came into being, on the one hand, socialized production replaced individual production, and on the other hand, the ownership of the means of production by the workers was changed into ownership of the means of production by the capitalists. In the capitalist enterprises a planned division of work with strict organization is practiced. But social production is still subject to the spontaneous division of work, thus an anarchical state of affairs becomes more aggravated. In these circumstances, the market has simply become omnipotent God, and its role has been brought into the fullest play. Independent and scattered producers fight at close quarters here and are lashed by the market, running around here and there. True, this brings external pressure to bear on the producers and promotes the development of capitalist production, and provides the various producers with the only form in which they can interrelate so that the various departments of social production can continuously grow from imbalance to balance. But it also causes enormous waste of social wealth and causes continuous and grave damage to productive forces. If it is tenable to say that the spontaneous regulation by market mechanism has played a great role in the progress of society, then it is justified to say that this progress was won at great cost.

The traditional and philistine economists have all along persisted in advocating that the capitalist economy is a machine that regulates itself, and maintained taking a laissez-faire attitude towards it and opposing state intervention in economic matters. However, with the development of productive forces and the increasingly acute contradiction between socialized production and the ownership by the capitalists, the bourgeoisie was forced the change the concrete forms of relations of production, from private capital to stock capital and from private monopoly to state monopoly within the limits of the fundamental capitalist system. In this course, the economic role of the state is becoming increasingly strengthened. At present companies or monopolistic groups not only have considerably strict current plans but also are pursuing long-term plans, endeavoring to push the production and circulation of the whole society to a certain planned stage. The planned intervention by the bourgeois states has played a certain role in restraining this anarchical state of affairs but conscious social regulation over production is out of the question. In these states most of the means of production are privately owned by the capitalists. The planning of the bourgeois states has no binding force over private enterprises. Rather, it is only in a position to encourage and restrict them by using the means of taxation, credit and subsidy. Therefore it has only a certain impact on the development of the economy but cannot determine the course of social production and reproduction.

It is only under socialism that social conscious regulation of production can be accomplished. Under mature socialism, in which all means of production are owned by the whole society, labor becomes united labor on a society-wide scale. At this stage, the social eocnomy has become a big machine and an economic body in which all workers work in accordance with common planning. Instead of being blindly subject to the market, production is carried out in conformity with scheduled planning. This enables people to establish direct relationship between the amounts of social labor which are needed in production certain productions and the scope of social needs which should be satisfied by the products and carry out social production in close conformity with the needs of the whole body of workers; to frequently and consciously maintain the balance between the various branches of the national economy and various links of reporduction and develop the social economy in a coordinated way; to rationally use manpower and resources truly in accordance with the law of time-saving. All these indicate that carrying out planned production and planned distribution is several times superior to carry out production blindly at the mercy of the market. Of course, under socialism, owing to the faults in planning work, there will possibly emerge disproportions in the economy. But the society can conscientiously regulate the disproportions in the economy and not allow them to develop to an extremely serious extent. This is also the superiority of planned production.

True, as the main regulator of production, the market at one stage played a great role. But if society has developed to a stage in which production is carried out according to scheduled planning and in reality, production has been carried out in such a way, then we must have a different evaluation of the role of regulation by market mechanism. In the past, there was over-rigid and excessive control by state planning and no attention was paid to giving full scope to the role of regulation by market mechanism and, furthermore, planning itself was not so scientific and did not accord too closely with the demands of the objective laws, and for this purpose both in the entire economic system and in the planning management system, large-scale reforms should be carried out. But we must not negate the planned economy for this reason. There is an argument that the disproportions in China's national economy and its irrational structure are the result of a centralized system. It is argued there will inevitably be such phenomena as issuing arbitrary orders and if we abandon the regulation by planning mechanism of a directive nature and establish the management system which fully makes use of the market, thus we can assuredly develop the national economy in a proportionate and coordinated way. According to this argument, the capitalist economy should have already have been guaranteed to develop the national economy in a proportionate and coordinated way, because there is no regulation by planning mechanism of a directive nature there and the role of the market has been brought into the fullest play. But it is precisely the proportional relations which are needed in the normal development of the capitalist economy which are needed in the normal development of the capitalist economy which often suffered damages, and it is only through accute turbulence and even crisis that the lost balance can be restored. What is the reason? It is because people were subject to the spontaneous force of the market and all social production was in a state of anarchy. In fact, the bourgeois economists have long disbelieved that the coordinated development of the capitalist economy could be ensured by relying mainly on regulation by market mechanism. Keynes, who was once looked upon as sage, by the monopolistic bourgeoisie and its political representatives in various countries, advocated discarding the policy of laissez-faire and practicing regulation by the state several decades ago. This does not mean that Keynes and his successors were wiser that their predecessors were. It was because the productive forces had developed to such a degree that private capitalism could no longer control them. Thus, if they did not treat productive forces, as far as was permitted by the capitalist relations of production, as social productive forces, it would be difficult for the capitalist system to survive. It can be seen that carry out planned regulation by society is, in the final analysis, the objective demand of the development of the socialized productive forces. If we say that under capitalism, in which there were no social conditions for so doing, the bourgeoisie had to conform to the requirements of productive forces to a certain extent in order to practice regulation by the state, then why should we discard planned management and put the economy at the mercy of the market in a time when we do have had the social conditions for so doing?

It must be pointed out that I think that there is an intrinsic difference between the regulated economy of the bourgeois states and our planned management. The bourgeois economists call the capitalist economy a "market economy," while we call the socialist economy a "planned economy." What is a planned economy? It is nothing but the national economy operated consciously by the society in accordance with the scheduled planning. It is precisely the planned economy which clearly indicates that socialism is "the conscious socialist organization with planned production and distribution," ("collected works of Marx and Engels," Vol 20, p 375) and the "large-scale socialized and planned production (or economic system)," ("collected works of Lenin," Vol 10, p 407) that is to say, these are two different social production organizations and two different economic systems.

Some bourgeois economists tried to pass off fish eyes as pearls, arguing that there was no difference between the regulated economy of the bourgeois states and the socialist planned economy. For instance, some people say that "just like technology, planning is politically neutral," "it can be realized in any social form." Some people say that the essence of planning is to create "favorable conditions for enabling commerce to organize its own activities," and so on and so forth. There were already some people who lump together these two things of different nature within the workers' movement, arguing that the regulation of the economy by the bourgeois states means replacing, the capitalist principle of free competition with the socialist principle of planned production. This reminded people of the criticisms conducted by Engels of the viewpoints similar to this argument. At that time, some people of the bourgeoisie called every move taken by the state to intervene in free competition "socialism." In criticizing it, Engels said: "If one believes this bourgeois fallacy, which even they themselves only pretend to believe, one will come to the conclusion that the state means socialism." ("Collected Works of Marx and Engels," Vol 35, p 164) A state has a class nature. This is the crux of the matter. The more a bourgeoisie state strengthens its intervention in the economy, the more capital it amasses in its hands, thus becoming a more ideal general capitalist. The supreme and ultimate aim of its activities is the safeguarding of the capitalist system and the service of monopolistic capital. This has been not only testified to by a large number of facts but also acknowledged by many bourgeois economists. (Hansen) [3352 2773], man of the hour in American economic circles said that during the two decades of the 1940's and the 1950's, "We have expanded the role of the government to an extent never dreamt of before. Instead of weakening the capitalist system, this expansion has brought a new motive force to the capitalist system, this expansion has brought a new motive force to the capitalist system." [Hansen] "Economic problems in the 1960's of the 20th century"] The bourgeois economists who maintained the stand of nonmonopolistic capital such as Adams and Gray (Ge Lei) [2706 7191] fairly pointed out that "regulation by the state has become a tool for establishing, safeguarding and subsidizing private monopolistic organizations," the regulatory organs have become safeguarding and subsidizing private monopolistic organizations," the regulatory organs have become the "houseboys of the owners of enterprises they should regulate." (Bu Liu Ming) [4580 3866 2494]: "The crisis of modern bourgeois political economy") A planned economy was born out of public ownership of the mean of production. It indicates in one important aspect the essence of the socialist economy. We must not confuse the intervention of the bourgeois states in an economy and a planned economy.

II. The Scope And Degree Of Planning Depend On The Degree Of Socialization

A socialist economy must develop along a scheduled plan, but the scope and degree of planning in a certain period in a country depends on the degree of socialization and in addition to this. The degree of socialization depends on that of the socialization of production. Therefore in the final analysis, the degree of socialization is determined by the level of development of productive forces. After the October revolution and during the civil war, a war time communist policy was practiced in Russia. Excluding economic measures, this policy mainly took certain military measures and put the product supply and distribution under direct state administration bypassing the market. After the civil war came to an end, Lenin wisely discovered that in an economically backward country like Russia where small farmers held a dominant position, overall planning should not be practiced. Along with the transition to a new economic policy, the method of "replacing trade entirely with planned and organized product distribution" was ended. On the one hand, the scope of direct planning by the state was reduced. Lenin pointed out: "A complete, integrated, real plan for us at present equals a bureaucratic utopia." He said in a warning tone: "Don't chase it." ("Collected Works of Lenin," Vol 35, p 473) As a result, during the years from the adoption of the new economic policy to the passing away of Lenin, apart from the "All-Russia Plan for Electrification" (Lenin called it "The Second Party Program"), which was a long-range plan for transforming Russia, only some departments formulated plans of development instead of a comprehensive plan for the whole national economy being worked out. On the other hand, [illegible] methods of planning management were changed. The decision of the 12th national congress of the Russian communist party held in April 1923 clearly pointed out that it was necessary "to frequently and watchfully adapt oneself to the market conditions and market relations." The "decision" read: "Now that we have adopted the form of a market economy, the state must give the various enterprises the necessary freedom to engage in economic acitvities instead of replacing this freedom by administrative means;" "most of the state-run industries should be organized into trusts, that is, into integrated enterprises which have extensive economic autonomy so that they can act freely in the market as exchanging units."

After Lenin passed away, Stalin led the people of the Soviet Union in carrying out socialist construction. In 1928, a year when the foundation of heavy industry was laid through the struggle for the industrialization of the socialist country and great achievements were made in the socialist transformation of agriculture and the mass collective farm movement was in the upsurge, the Soviet Union already had the conditions for carrying out the first five-year plan for developing the national economy. It is undoubtedly correct to bring the national economy into the orbit of planned development once the conditions are ripe. The problem lies in the total negation of the regulatory role of the market over production and in ever-increasingly excessive and over-rigid planning. Not only was it not suitable at that time, but even in a considerably long historical period, even though productive forces have developed remarkably but have still not developed to the full, it is not suitable. Its drawbacks are being increasingly so exposed that almost all countries that indiscriminately copied the method are having to confront the task of reforming the planning management system.

China's planning management system was mainly copied from the Soviet Union in the early stage of the founding of the PRC. In 1953, a year when the recovery period was just ended, we began our first five-year plan. At that time, owing to the coexistence of five economic sectors, the plan was not all-inclusive. For instance, indirect planning was carried out in the nonsocialist sectors of the economy. Quite a few construction projects and the production of less important products were put under regulation by market mechanism. Along with the basic completion of the socialist transformation of agriculture, handicrafts and capitalist industry and commerce, the scope and degree of planning had to be expanded and improved, but in looking back at the course we have taken, we found that the excessively and over-rigidly controlled planning did not tally with China's actual conditions.

At the present level of productive forces in our country, there is still a long way to go to fulfill the goal where the means of production as a whole is owned by the whole society and united labor is organized on a society-wide scale. Thus it is impossible to include all social production in an all-inclusive and unified plan and to directly carry out social planned regulation over all production.

For a considerably long period of time to come, we must reserve, and appropriately develop, the individual economy in which there is no exploitation, and reserve and vigorously develop the collective economy of the working people in cities and the countryside. The former is a necessary supplement to the socialist economy and the latter is the major part of the socialist economy. It is needless to say that the state cannot exercise direct planned management over the individual economy. This is also so of the collective economy. This is because, if we exercise direct planned management over the collective economy, it will mean the negation of the collectives decision-making power and the negation of the fact that they are the owners of the means of production under collective ownership. What is more, since the collective production units are so numerous and scattered, the state is unable to exercise planned management over them. The state can only pass down targets as reference for the collective production units and guide them in pricing, taxes and credit, thus enabling their production to suit the requirements of state planning. For instance, the peasants who constitute 80 percent of the national population are still leading a semiself-sufficient life. The natural conditions of various localities for the state to put the production and livelihood of the various production teams under unified planning. Apart from fulfilling the state purchase and assigned quotas, what to grow and how much to grow should be regulated by the market to a great extent. The state can influence them through various ways but must not direct them on how to make arrangements for planting. In working out their production plans, the production teams must give consideration to the fulfillment of the state purchase and assigned quotas. The reference to the state planned targets and the guidance offered by the state through various economic methods will enable their production to have the aspect of production of the whole society and enable their economic activities to be commensurate with state planning. Therefore the fact that the state does not exercise direct planned management over the collective economy does not affect the fact that our economy is, generally speaking, a planned economy.

Public ownership occupies a dominant position in the entire national economy while the state-owned economy must hold a leading position in public ownership. China's economy is thus at present and it will be so for a long time to come. Over the past two years, in the discussions on the reforms of the economic system, some comrades advocate abolishing or basically abolishing the state-operated enterprises. We must analyze this argument. It seems today that it is not necessary to run too many state-operated enterprises. It is not necessary for some enterprises in commerce and service trades such as small-sized public bathhouses, barbershops, restaurants, tailors (clothes shops) and retail stores to be run by the state. In quite a number of places these kind of enterprises have been changed into cooperatives or cooperative groups or have been assigned to be operated by a collective of workers and individual workers under a contract, thus resulting in quick and reasonable returns.

In addition, small-scale enterprises and most medium-scale enterprises can be changed into enterprises which assume full responsibility for their won profits and losses. Beginning from last year, some enterprises have practiced the system of "practicing independent business accounting, taking responsibility for thier own profits and losses and paying taxes rather than handing over profits to the state" on a trial basis and this experiment should be gradually popularized in future among the majority of the small and medium-sized. After assuming full responsibility for their own profits and losses, apart from handing over various taxes, payments for purchases and the capital and interest payable on state loans to the state, the enterprises will no longer hand profits to the state, and the surplus income can be used for expanded reproduction, the income of the staff members and workers and collective welfare at the discretion of the enterprises in accordance with the state unified decrees and policies. Will the state financial revenue be reduced in this way? The key of the matter lies in the tax rate. If the tax rate is rationally fixed, it will ensure the state earns more revenue than before on the basis of increased income of enterprises. The state must not pass down any more planned targets of a directive nature to the enterprises which are carrying out the two above-mentioned systems. The production orientation and output of enterprises should be fixed and arranged by the enterprises themselves according to market conditions.

State-operated enterprises cannot be abolished or basically abolished. The important economic branches such as banks, posts and telecommunications, railways, aviation, the major inland and oceangoing shipping, large-scale and some medium-scale factories (farms), mines, wholesale centers and large-scale stores must be operated by the state. First of all, this is the objective demand of the development of productive forces. In the past, in commenting on the bourgeois nationalization, we paid attention to exposing the essence of its remedying and subsidizing the capitalists. That was correct. But we ignored the fact that some economic branches and enterprises could only be run by the state. In talking about the bourgeois nationalization, Engels said that when construction commenced some means of production or communication means such as a railway, its scope was so big that it excluded any other form of capitalist management and in a certain stage of development, a stock company would not be big enouch to undertake it. Thus, the capitalist countries had to bear leadership over production, and he pointed out, that if the means of production or communication means had truly developed to such an extent that stock companies could not manage them and their nationalization had become economically inevitable, then bourgeois nationalization would mean economic progress. This was because this marked a new preparatory stage in the society itself owning all productive forces. ("Collected Works of Marx and Engels," Vol 20, p 302) At present, the state-owned enterprises of developed countries constitute a relativel big proportion of the economy. For instance, West Germany's post, telecommunications, railways and aviation are operated by the state. The proportion of generated electricity owned by the state constitutes three fourths; of gas and coal, one half; of petroleum products, automobile manufacturing and ship building, one fourth. If we say that, pressed by the demands of socialized production, the capitalist countries have to run the enterprises which have become unsuitable for management by stock capital, then being a socialist country, how can we abandon the management of the major economic branches and large-scale enterprises? Second, without a grasp on the major economic branches and enterprises, it is hard for the state to exercise planned leadership over the whole national economy. In developed capitalist countries, the government as the owner of large numbers of state-owned enterprises, must work out development plans for the state-owned enterprises and try to integrate state planning with the planning of various monopolistic groups, with the result that the economies of these countries have a certain amount of planning. One of the important reasons why the bourgeois states can undertake the task of regulating the economy is that they have obtained such enormous financial strength to be masters of economic development. The American governments at various levels have obtained almost one third of the total national output value through taxes and other channels. In order to bring the state's coordinating and regulating role into play, as the bourgeois states must obtain such enormous financial strength, then since we are resolved to carry out a planned economy, how can we hold nothing in our hands? Although the enterprises under the system of collective ownership and enterprises assuming full responsibility for their own profits and losses simply should proceed in carrying out their business activities from the interests of the whole society, they usually proceed from the interests of their own units to a greater extent. Without the state-owned economy holding a leading position in the national economy, it is hard to ensure that social production as a whole will be in the interests of and fulfill the needs of the whole body of workers.

State-owned enterprises should carry out production according to state planning. In other words, the state should exercise direct planned management over its enterprises. But it is generally acknowledged that the key point of the reforms of the economic system must be the extension of the decision-making power of enterprises.

This is undoubtedly correct. However, the power of the enterprises of different types must not necessarily be the same. For instance, the enterprises assuming full responsibility for their profits and losses must have fuller decision-making power and the state-owned enterprises must have fewer and less powers. Of course, this does not mean that we must not solve the problem of "eating from the same big pot" existing in these enterprises and not carry out reforms of the economic system. In order to establish some relationship between the operational results of the state-owned enterprises and the benefits they receive, it is necessary to practice a profit-sharing system, and the enterprises are authorized to determine how to use the retained profits. The state management over enterprises should be appropriately relaxed and the shortcomings of passing down too many targets to the units below, not allowing the enterprises room to give scope to their initiative and not allowing them to independently arrange production and marketing of their products through their own channels on the basis of the fulfillment of their targets must be ended. But generally speaking, state-owned enterprises must carry out production in accordance with state planning. This kind of enterprise constitute a minority of the total number of enterprises, but being large in scale (some are also medium-scale), the output value of these enterprises constitutes the greater part of total output value. If the production by the rural production teams used for fulfilling the state purchase and assigned quotas is included, the proportion of production according to state planning will be still greater.

If the above-mentioned production (and the part produced by the production teams for the fulfillment of the state purchase and assigned quotas) is carried out by the state-run departments and enterprises in accordance with state planning, then the major part of industrial and agricultural production is already carried out according to planning. The other enterprises, including the small enterprises which produce the means of production, can carry out free production in the light of market conditions and within the limits of that allowed by state planning. Comrade Chen Yun specially pointed out that the enterprises should be allowed to work out their quotas and carry out the production of articles for daily use, handicrafts and small native products in accordance with market conditions. Only certain varieties should be subject to regulation by market mechanism. It seems today that those who should produce products subject to market mechanism must be the enterprises under the system of collective ownership and enterprises assuming full responsibility for their own profits and losses.

So much for production; what is about circulation? According to the opinions of comrade Chen Yun, the circulation of the means of subsistence must be as follows: the products essential for the livelihood of the people such as grain and cloth must be purchased and marketed by the state at planned prices. These commodities are relatively few in variety and they can also be put under state unified purchase and marketing. Unplanned purchase and sale of other small native products, articles of daily use and handicrafts is allowed. In concrete terms, the commercial departments must purchase these products according to the principle of priority and according to market demands and product quality and no longer monopolize everything in this respect as they did in the past. After the commercial departments have purchased products in accordance with the principle of priority, the production units can consign their surplus commodities to the commercial departments for sale or market them through their own channels. The implementation of these methods is conducive to helping the production units pay close attention to product quality and concern themselves with the needs of consumers. The prices for these commodities must not be rigidly fixed and price fluctuations on a certain scale must be allowed. Being numerous in variety but small in value, these commodities, by and large, account for about one fourth of the total volume of commodity retail sales according to past experience. This indicates that the means of subsistence must have planned purchase and planned sale as its main part and free purchase and free sale as a supplement. In regard to the means of production, we should not act upon the proposition advocated by some comrades that the state should not control any of the means of production but should delegate them all to the enterprises and allow the enterprises to balance supply and marketing themselves and that the state should concern itself only with balancing allocation. Rather, the state must uphold the planned distribution supply of major goods (including fuels, major raw materials and equipment). The goods subject to planned pruchase and sale by the material and commercial departments, including most motorized and electrical machines in the second category, some metal materials, chemical materials and building materials should be subjected to planned management as should the goods mentioned above, but the supply methods should be improved. For instance, as regards quantity, unified distribution should be practiced, but as regards quality, apart from a small number of goods which are in seriously short supply, the users must be allowed to purchase according to the principles of priority and of having high price for top quality. In addition, apart from bulk goods that should be put under direct supply for a fixed number of units, the rest should be as far as possible be put in retail departments for sale on the spot and in the neighborhood under the unified projects of ordering goods. In other words, we must put as many of these goods onto the market as possible.

Putting goods onto the market does not mean being regulated by the market. The works of some comrades, they lump these two things together. We can illustrate that this argument is wrong by some lucid examples. Our grain and cloth are put onto the market but are generally not regulated by the market. Of course, the enterprises are allowed to market their products outside the plan through their own channels, by relying on regulation by market mechanism and to generally fix the price. Free sale of goods which are not subject to unified purchase and marketing by the state was allowed in the past and this should be allowed all the more in future.

III. Discussions and Queries

All of us have been unanimous in the proposition that we must have regulation by market mechanism. But there are still wide differences in views on the scale of regulation by market mechanism and the amount of regulation by market mechanism necessary as compared with the amount regulation by planning mechanism needed.

Some comrades have doubts that production and supply can be divided into two parts with the major part being subject to planning (that is, the so-called "regulation by planning mechanism) nad at the same time, the other part being subject to market conditions (that is, the so-called "regulation by market mechanism"). First, they hold that regulation by planning mechanism cannot be separated from the role of the market and regulation by market mechanism cannot be separated from the guidance of planning. True, in commodity production, not only planned regulation but virtually all economic activities are subject to the role of the market. However, the problem here is not whether or not we should put goods onto the market and use the role of the market but is whether the production orientation and quantity are subjected to market conditions or to planning. What is meant by the so-called "role of the market?" Even if it means the regulatory role, that is to say, the production carried out according to planning is also regulated by the market, there should be the question of what is the main factor regulating production. How that there is the production subject mainly to regulation by planning mechanism and that mainly subject to regulation by market mechanism, it is still the question of division into two parts. Thus production and supply being divided into two parts is objective reality and not artificial.

Second, some people worry that the method of taking planned production and circulation as the main part will stifle the economy. In fact, this worry is on unnecessary. The reason why our economy became inflexible in the past is that we put everything under state unified planning, but the method of taking planned production and circulation as the main part enables the greater part of production and marketing (referring to product variety not output value) to be carried out freely within the limits of that permitted by state planning. Furthermore, the methods of planning should be improved. In these circumstances how can the economy be inflexable? At present, the reforms we are carrying out, of the economic system, have not reached the extent we expected but have already made the economy more active. If we further give scope to the supplementary role of regulation by market mechanism in the coming reforms of the planned management system, it is certain that the economy will become more active rather than becoming more rigid.

Some comrades advocate that regulation by planning mechanism should be realized through regulation by market mechanism or through the market mechanism itself. No further explanation of how to specifically realize it was made. If we act upon what they have proposed, our economy will probably become a "market economy," somewhat affected by state intervention leaving only regulation by market mechanism with little sense of planning.

Although some comrades agree with the proposition that production and supply should be divided into two parts, they want to use another method of division, that is, they advocate that the so-called macroeconomy (defined as; the proportion between accumulation and consumption in the national economy, the distribution of investment in state capital construction, the balance between social purchasing power and the supply volume of commodities, the control of the total sum of wages and so on) should be subjected to regulation by planning mechanism, while the economic activities of enterprises (the so-called microeconomy) including what to produce and how much to produce should be subjected to regulation by market mechanism. It is undoubtedly very necessary to subject the major matters concerning the whole national economy to planning. But if the "macro" is wholly different from the "micro," the "macro" will probably be made a mere figurehead, becoming just a "gentleman on the rampart." Just think, if all enterprises go their own way, how can a so-called "macro policy decision" in state planning play its role? If all enterprises carry out their activities at the mercy of the market, how can state planning be realized? So its practical results will probably be regulation by market mechanism without regulation by planning mechanism or the latter will, at most, play a coordinating role as in the planning of the bourgeois states.

It seems that the above-mentioned methods are not feasible, and the only feasible one is to uphold carrying out a planned economy and at the same time give scope to the supplementary role of regulation by market mechanism.

The major branches of production and circulation should be subject to planning and the rest should be subject to regulation by market mechanism. Those which are subject to planning should make use of the market as far as possible and thos subject to regulation by market mechanism should subject themselves to the guidance of planning. The problems now are that planning still remains excessive and over-rigid and the role of regulation by market mechanism has not been brought into play. Therefore, it is necessary to gradually reform the existing planning management system. The aim of reform is to improve and strengthen the planned economy, provided we do away with the excessive and over-rigid defects of planning, improve the planning methods, and raise planning to the stage of being scientific, it is certain that our socialist planned economy will be far more superior to the so-called market economy. It not only has no integral relationship with the disproportions in the economy, but it alone can avoid the drawbacks of the market economy. China's historical facts over the past 30 years have fully proved this point.

'JINGJI YANJIU'ON PLANNED ECONOMICS

HK051435 Beijing JINGJI YANJIU in Chinese No 9, 20 Sep 81 pp 10-13

[Article by Li Zhenzhong [2621 7201 0022]: "On the Subject of Planned Economics"--footnote describes this article as the author's speech written in July 1981 and given at a forum convened in the same month]

[Text] Planned Economics Is A New And Young Branch Of Learning

Scientific theories in all branches of learning stem from practice. Planned economics is no exception.

Planned economics is a new branch of economics which came into existence at a time when human society entered the stage of socialism. With the achievement of victory in the proletarian revolution, changes have occurred in the economic realm: The expropriators have been expropriated, the small producers have been subjected to socialist transformation, and a system of socialist public ownership of the means of production has been established. Thus, the system of exploitation of man by man has been completely abolished. This is the basic superiority of the socialist system over the capitalist system. However, with the establishment of the socialist economic system. A new and unprecedented task has arisen: How should society organize and manage the national economy and how can we get the huge machine of the national economy to operate smoothly, so that the continuous expansion of social production and the continuous improvement of the people's livelihood can be ensured?

On the basis of analyzing the contradictions of the capitalist economy, Marx and Engels put forth the principle that in the socialist society, social production must certainly develop in a planned way. Engels said: "When society gets to own the means of production, ...the anarchic state of social production will give way to planned and conscious organization." (Engels: "Anti-Duhring," in "Selected Works of Marx and Engels," Vol 3, p 323) "Then, society should consider what it can produce with the resources in its possession. In the light of the relationship between these productive forces and the vast numbers of consumers, it should also determine the appropriate extent of any desired increase or decrease in production." (Engels; "Outline of a Critique of Political Economics," in "Collected Works of Marx and Engels," Vol 1, p 615) Marx also clearly said that under the socialist system, "The social and planned distribution of labor time regulates the appropriate proportions between various labor functions and various needs." (Marx: "Das Kapital," People's Publishing House, 1975 edition, Vol 1,141 96) Lenin and Stalin enriched and developed Marx's and Engel's ideas in the light of the practice of socialist economic construction. Lenin held that, after the seizure of political power, the proletariat's main task "is to establish an extremely complicated and meticulous new organizational system and to produce and distribute in a planned way, those products which are essential to the survival of millions of people." (Lenin: "The Current Tasks of the Soviet Government," in "Selected Works of Lenin," Vol 3, p 495) Stalin even more systematically discussed the planned development of the socialist economy. Undoubtedly, the principle of the planned development of the socialist economy, expounded by our teachers of revolution, is absolutely correct. Since its birth, the socialist society has been undertaking the great practice of developing the economy in a planned way in the entire society. In the course of this great practice, not only had the socialist economy attained unprecedented rates of development and achieved enormous successes in construction, but relatively plentiful experiences in managing the national economy in a planned way have also been accumulated. Planned economics has been founded under the guidance of Marxist-Leninist theory and on the basis of practical experiences.

The socialist society has opened up broad prospects for the planned development of the national economy, but this does not mean that all problems concerning planned development have been easily solved. Actually, many problems still remain to be understood and solved. However, solving them needs time and a considerably long process of practice and understanding. Desirable results cannot be achieved in a short time. As a socioeconomic form, socialism only has a history of the 60 years or so since 1917, when the October Socialist Revolution took place in the Soviet Union. This socioeconomic form has existed for only a short time. In our country, only 32 years have elapsed since the founding of the PRC in 1949, and thus, the history of our socialism is even shorter. Because of this historical reason, it is not surprising that the system of a socialist planned economy still has various imperfections.

The socialist planned economy embodies the essence and superiority of the socialist system. Undoubtedly, it has vitality. However, its history is, after all, not very long and it is still developing. People's knowledge of it is still continually deepening. Therefore, it is still impossible today for planned economics to attain maturity, whether on the plan of theory or methodology. In this sense, planned economics is still a young discipline. It will become increasingly more mature and perfect with the development of the practice of the socialist planned economy.

The Object Of Planned Economic

The question of the object of various sciences is related to the orientation of development of the various disciplines and their basic contents. Therefore, the question of the object is of primary importance to every discipline.

In the past, there have been many views on the object of planned economics. At present, people still lack a unified understanding. This surely affects the building and development of this branch of learning. Therefore, the question of the object is of primary importance to every discipline.

In the past, there have been many views on the object of planned economics. At present, people still lack a unified understanding. This surely affects the building and development of this branch of learning. Therefore, studying and resolving the question of its object is of primary importance to the building of this branch of learning.

What kind of science is planned economics? Judging from its nature, as a branch of learning it is an economic science. However, this point does not clearly state the characteristics of its object and does not help us distinguish it from other economic sciences. I think that a precise statement of its object is that planned economics is a science concerning the planned development of the socialist national economy. Planned economics is not something illusory or incomprehensible. It is merely a theoretical summary of the practical experience acquired in the socialist planned economy. Therefore, the most crucial question it should answer is how to achieve the planned and proportionate development of the socialist national economy. This question is also tantamount to the basic task of planned economics.

Comrade Mao Zedong said: "The sciences are differentiated precisely on the basis of the particular contradictions inherent in their respective objects. Thus the contradiction peculiar to a certain field of phenomena constitutes the object of a specific branch of science." (Mao Zedong: "On Contradiction," in "Selected Works of Mao Zedong," People's Publishing House 1966 horizontal typesetting edition, Vol 1, p 284) The subject under study in planned economics also contains some specific contradictions. The object that we have mentioned above clearly indicates the specific contradictions under study in planned economics, and hence points out its relationship with, and its differences from, other economic sciences. To more satisfactorily understand the object of planned economics, we need to discuss and explain it further. The above-mentioned object includes two contradictions which must be studied, namely that between equilibrium and disequilibrium, and that between having recourse to planning and having recourse to blindness.

Let us discuss the contradiction between equilibrium and disequilibrium.

What we mean by equalibrium and disequilibrium here refers to a comparison of social production and social needs in terms of space and time. Equilibrium is indispensable to the development of the socialist national economy. Without it, the national economy cannot develop soundly and rapidly. In the course of national economic development, any state of equilibrium will inevitably be disrupted, resulting in a new disequilibrium. In this sense, disequilibrium is also indispensable to the development of the socialist national equilibrium. An absence of disequilibrium implies that the national economy is stagnant. Thus, the socialist national economy develops amid the movement of the contradiction between equilibrium and disequilibrium. Equilibrium is relative and conditional, whereas disequilibrium is absolute. Planned economics is aimed at studying, understanding and mastering the laws concerning the movement of this contradiction, so that equilibrium can always be consciously maintained. In this sense, planned economics is aimed at dealing with the constant and conscious maintenance of equilibrium on the scale of the entire society. In a word, it is "the study of the comprehensive equilibrium of the national economy."

Let us discuss the contradiction of having recourse to planning and having recourse to blindness.

What we call the constant and conscious maintenance of equilibrium actually means having recourse to planning, which is nonexistent in a society based on private ownership, and which is possible only when human society has developed into the socialist society, which is based on public ownership. However, in the economic life of the socialist society, blindness has not disappeared, but always exists on an extensive scale. Of course, this kind of blindness is essentially different from the kind of blindness in capitalist production. Under the condition of socialism, there are two categories of blindness, namely subjective blindness and objective blindness. Subjective blindness refers to subjective mistakes in planning and guidance. It is manifested as the divorce of planning from objective realities. Therefore, plans that are divorced from realities represent blindness that contradicts the resort to planning. Objective blindness means that various economic units carry out economic activities in their own different ways, departing from the track of unified national economic plans because each only cares about its own economic interests. Therefore, those economic activities marked by each going its own way and by departure from the track of unified planning also represent a kind of blindness that contradicts the resort to planning. The existence of blindness is due to various reasons. There is a reason involving knowledge or the theory of knowledge. There is an economic reason involving the differences in interests between two different forms of public ownership and between the economic units under these two forms of ownership. There is also an ideological reason, namely the serious influence of old ideologies such as decentralism, departmental selfishness, local selfishness and so on. Therefore, during the historical period of socialism, blindness will permanently exist, so that the contradiction between having recourse to plans and having recourse to blindness will also permanently exist. Planned economics must study and correctly resolve this contradiction so as to reduce blindness and strengthen the reliance on planning.

These two contradictions are the specific contradictions under study in planned economics, and also constitute the nature of its object.

The Content Of Planned Economics

The content of planned economics is determined by its object. In the light of the object stipulated by us, the content can be summed up in three sections.

First, the study of the theory, system and method of national economic planning and management.

The study of the theory, system and emthod of national economic planning and management has not been given its due position in textbooks published in the past. However, it has become an important task which is studied by, and to which great attention is paid by, people at home and abroad. Over the past 20 years and more, many socialist countries have been studying and practicing reforms of economic management systems. Such study and practice, without exception, are related to such major matters as the theory, system and method of planning and management. In particular, they are concerned with such questions as what the socialist planned economy should be understood to be, how to undertake planning and management given the existence of commodity and money relationship, how to build a planning system, how to achieve unified planning for the national economy, and so on. Planned economics should answer these questions.

Second, exposition of the specific laws governing socialist economic processes. These laws mainly refer to those governing specific changes in the structure, rate of development, proportional relations and economic results of the socialist national economy; those governing the interrelationships between, and changes in, the rate of development and the proportions; and those governing the interrelationships between, and changes in, economic results on one hand and the rate of development and proportions on the other. This content can be summed up as the exposition of the laws governing the specific relations between, and the changes in, various processes in socialist reproduction or various sectors of the national economy. In this context, not only is qualitative analysis necessary, but quantitative analysis must be well performed, because quantitative problems are inherent in rates of development, proportions and results. It is unimaginable that planned economics, as a science of economic management, can do without quantitative analysis.

Third, exposition of the principles and methods of the formulation of national economic plans.

How to formulate national economic plans is an important part of the content of the economics of planning. The process of formulating plans must generally include three stages: First, ascertaining the quantities needes; second, ascertaining the quantities of available resources; and third, achieving equilibrium between the available resources and the needs. To accomplish the first-state tasks, we must have correct principles and scientific methods. Although three are a large number of principles governing planning, they can be summed up in two categories, namely general principles and specific principles. General principles are applicable, in the long term, to the entire economy. Specific principles are temporarily applicable, or applicable on a partial basis. All principles, whether general or specific, serve as the basis for tackling complicated contradictions and relationships in the formulation of plans. The principles of planning do not arise out of nothing and they are not arbitrarily formulated. They arise from objective processes. They are conclusions which people draw on the nature of policies, in the light of actual circumstances and on the basis of knowledge of objective laws. Therefore, the correct principles of planning are scientific. Of course, we must not consider the principles of planning as osified, eternal and unchangeable. When circumstances change, old principles will be replaced by new ones. Planned economics must study and expound on these principles of planning, and they can then be correctly mastered and applied in formulating plans. There are also a large number of planning methods. These can be classified into basic methods and subsidiary methods. The method of comprehensive equilibrium is a basic method, whereas the methods of factor analysis, calculating proportions, drawing comparisons, fixing quotas and so on are subsidiary ones. Nowadays, we should lay special emphasis on the use of modern mathematical methods to serve the formulation of plans. As Marx said, a science can really attain perfection only when it can successfully make use of mathematics. ("Reminiscences of Marx and Engels," People's Publishing House 1957 edition, p 78) The problems of quantitative analysis in planned economics have certain characteristics: They involve a large number of calculations; they are related to many areas; and they are extremely complicated. To have timely and accurate quantitative analysis, we must use modern mathematical methods.

The Question Of The Name Of The Branch Of Learning

We have provisionally called this branch of learning "planned economics" in the foregoing analysis. Whether this is appropriate is open to discussion.

The name of a branch of learning is determined by its object and content. Its name should relatively accurately reflect its content. Many names have been assigned to this branch of learning. We have chosen "planned economics" from various names used in the past because it is relatively compatible with the object and content of this branch of learning. It possesses two advantages compared with other names.

First, it is distinct. The name of "planned economics" suggests that it is a branch of learning which studies the planned development of the socialist economy. The planned economy is the essential characteristic of the socialist economy. It is only in the socialist society that reproduction is subject to planning. Therefore, the name, "planned economics," helps draw a line of distinction between ourselves and those absurd arguments and theories which advocate subjecting the capitalist economy to planning. Moreover, this name is of great practical significance in adhering to the socialist planned economy and resisting the trend of thought which advocates displacing the planned economy with the market economy.

We should boldly and assuredly adhere to the viewpoint of the socialist planned economy.

Second, the name is concise. Some names used in the past are wordy and cannot be read easily, for example, "principles of national economic planning," "outline of national economic planning," "moving toward planning for the national economy," "study of national economic planning," and so on. Some comrades say that because one characteristic of this branch of learning is that it deals with planning for the national economy rather than for enterprises or sectors of the economy, the name must include the words "national economic planning." I think that, although this branch of learning deals with national economic planning, this does not imply that we must include the words "national economic planning" in its name. The name, "planned economics," can more satisfactorily give expression to this characteristic. The planned economy never refers to planning for individual enterprises or sectors. It actually refers to planning for social reproduction. Moreover, it should be pointed out that the basic principles explained in "planned economics" not only apply to national economic planning, but also apply to planning for an enterprise, a sector or a region. Plans for enterprises, sectors and regions are a constituent part of the living structure of national economic plans and must be subordinated to unified planning for the entire society.

In conclusion, we think that "planned economics" is a relatively appropriate name for this branch of learning.

NATIONAL POLICY AND ISSUES

SUPERIORITY OF SOCIALIST PLANNED ECONOMY

HK061046 Beijing JINGJI YANJIU in Chinese No 9, 20 Sep 81, pp 14-21

[Article by Zhang Zhuoyuan [1728 0587 0337] and Xing Junfang [6717 0193 5364] of Economic Research Institute of the Chinese Academy of Social Sciences: "Develop the Superiority of Socialist Planned Economy"]

[Text] I. Socialist Economy Is Planned Economy Based On The Public Ownership System

The socialist economy is a planned economy. This is determined by its innate nature. It is built on the basis of the system of public ownership of the means of production. "Public ownership" here refers first and foremost to ownership by the entire society. Engels wrote: "Once society takes over the means of production, the state of anarchy in social production will be replaced by a planned and conscientious organization" (Engels: "Anti-Duhring," "Selected Works of Marx and Engels," Vol 3, p 323). When the entire body of laborers control the means of production and become the masters or owners of the means of production, naturally the control and use of the labor power of society will be in accordance with the interests and needs of the society and social production will be arranged conscientiously and in a planned manner. Hence, once the socialist public ownership system is established, objectively the planned development of the national economy will be inevitable and the social economy will fall under the category of a planned economy.

A socialist planned economy is far superior to a capitalist market economy based on the private ownership system. It can eliminate the state of anarchy and the periodic economic crises of capitalism and conscientiously nad rationally utilize the manpower, material resources, financial power, and natural resources of the entire society. It can promptly select the best production and consumption patterns and continually improve the people's standard of living. This is illustrated by the actual practice in economic development of the socialist countries.

The development of a socialist planned economy breaks the fable of the supremacy of the market mechanism. It proves that in the sphere of macroeconomics, the planning mechanism is much more capable and effective than the market mechanism. Under socialist conditions the social center or the state can fully utilize more direct and more accurate data than data supplied by the market, namely, comprehensive materials from the statistical department and financial and currency departments, to formulate policies, and can achieve quick results in arranging and readjusting in a planned manner the production mechanism, in determining the direction of development of the national economy, in changing the ration between accumulation and consumption, and so on. At the same time, by means of the planning mechanism, we can avoid the disruption of the productive forces and other social confrontations frequently occasioned when sole reliance is placed on the market mechanism (as in the case of a capitalist society) in readjusting the economic structure and restoring the proportionate relations in the development of production of a society. The planning mechanism fully demonstrated its important role in the enormous accomplishments of the Soviet Union during the several 5-year plan periods before World War II and in China's speedy economic development during the first 5-year plan period. The planned nature of socioeconomic development is a manifestation of the natural features and superiority of the socialist system.

In capitalist production, planning is also seen within the enterprises. This has already been pointed out by Marx and Engels. After World War II, many capitalist countries have set themselves up as proponents of a planned national economy. Countries like West Germany, France, Japan and others, formulated development plans and forecasts, promoted planned guidance and adopted various administrative and economic measures to help the development of certain key departments and the realization of economic plans. Commencing 1947 Japan formulated one after another nine formal plans of medium or long-term duration and achieved certain results. Some economists have pointed out that since the 1950's the rapid development of Japan's machine-building, chemical and steel industries would not have been possible if a centralized and sustained policy of protective concern had been lacking or if reliance had been placed solely on the working of the market mechanism. Undoubtedly, the emergence of planning of this kind resulted from the objective demand of large-scale socialized production itself. Nevertheless capitalist countries are based on the system of private ownership of the means of production and products. Under the conditions of the private ownership system, economic planning and planned guidance can only be partial, restricted to a certain degree, and subservient to the private interests of the capitalist class. Unlike in socialist countries, they do not proceed from the interests of society as a whole when formulating or carrying out the development plan of the national economy. Nor can they realize regulation by planning mechanism in every aspect of the social economy, or, through propagating the use of the planning mechanism, achieve the harmonious development and overall balance of production of the whole society. As anybody can see, over the past 20 to 30 years, the "regulation by planning mechanism" done by the capitalist countries has not only not succeeded in enabling them to achieve a planned, proportionate and harmonious development in production or to eradicate the periodic economic crisis of capitalism, but has also made the stagflation of their economy become increasingly obvious and serious since the entry into the 1970's. Even economists of the capitalist class cannot but admit that in the 1980's the national economy of the principal developed capitalist countries will have to go through a strategic readjustment. This proves that capitalist countries are in no position really to carry out a planned economic system. One line of thought suggests that due to the backwardness of China's productive forces and the low degree of socialization of its production, it does not possess, at the present stage, the requisite conditions for implementing a planned economy, and that it is possible only after there has been a full development of the commodity economy. In discussing the problem of reforming the economic structure, some comrades have suggested carrying out overall regulation by market mechanism and abolishing the system of fixing targets by mandates from above. They have urged that the enterprises become fully independent, not relatively independent, commodity producers and that they should have a free hand in competition in the market. In our opinion, these opinions are not sufficiently comprehensive.

In our country, since liberation we have established a socialist public ownership system to conform with the socialization of production. With the economy of the socialist system of ownership by the whole people occupying the leading position in the entire national economy, the law governing the planned development of the national economy began to assert its role and the necessary conditions were found for implementing a planned economy. In reality, beginning from 1953, planned socialist construction has all along been in progress in the country.

Naturally, on account of the varying degrees in the level of development of the productive forces and in the system of ownership of the means of production, there arose divergencies in the sphere and extent of regulation by planning mechanism in various stages of socialist development. But one point is definite and for sure, and that is: Under the conditions of the system of public ownership of the means of production, a centralized and unified plan is indispensable. This is because the socialist economy can achieve development only on the basis of society or the state being able to regulate the entire economic activities of the society in a planned manner. If there is no unified planning for the major economic processes (particularly within the sphere of macroeconomics, then it means that the state or society has lost control of the entire economic activities. In this case the socialist economy will become a spontaneous and blindly-guided economy and the entire social economy will be in utter confusion. For this reason, refuting the necessity of implementing a planned economy and refuting regulation by planning mechanism are opposed to the very nature of socialist economy.

Viewed from the angle of microeconomics, reliance on market mechanism can bring about the liaison of production and demand and rectify the phenomenon of the stockpiling of certain products and the shortage of certain other products. Yet, from the macroeconomic standpoint, the market mechanism cannot ensure the regular and proportionate development of social production. The capitalist market economy depends on continually disrupting the proportions to realize a roughly proportionate development. It restores the balance of social production by means of periodic economic crisis. History has already condemned this road as inaccessible. We certainly cannot follow it. It is true that there are various kinds of maladies in our economic structure and that reform is needed. But this does not call for the banishing of the planned economy and planned guidance. On the contrary, it means that the system of the planned economy and planned guidance must be improved. The most obvious special characteristic of regulation by planning mechanism is that it can mobilize the entire strength and resources of society to solve the most urgent tasks of the moment and achieve quick results. The present is precisely the time for us to make skillful use of regulation by planning mechanism in order to overcome the imbalance in the national economy, to set up a rational economic structure, to build a new road of economic development which conforms with objective law and the national condition of our country, and to improve the effect of economic activities and bring about economic cycles of an efficacious character.

The implementation of a socialist planned economy requires adherence to objective laws. That there are laws on the planned development of the national economy within the socialist economic structure does not necessarily signify that the plans formulated by us for the development of the national economy are all in conformity with the demands of the laws governing planned development or of other laws. It only shows the way for the planning department to correctly plan the production of society. To convert this possibility into reality and to formulate plans that can correctly reflect the economic conditions, it is necessary to place planning on a strictly scientific basis. In actual economic life, a plan cannot be absolutely faultless. At the same time, changes in the objective conditions or errors in subjective policy-making can also upset the proportionate relations of the national economy or even cause serious disporportion. However, whenever such a thing happens, it can be spontaneously readjusted by means of the strength of the socialist system itslef and the departments concerned can achieve a balanced development. This demonstrates the enormous vitality of the socialist system.

Over the past 30 years since the founding of the republic, our planned socialist construction has achieved great success, with almost nothing to start with, we have built up an independent and comparatively integrated industrial system and national economy. In 1980, compared with 1949, grain output increased by 181 percent; cotton by 508 percent, and the three kinds of edible oils (peanut, rapeseed, and sesame) by 168 percent. All of these increases were higher than the population growth rate of 81 percent. This has changed the poverty-stricken state of the broad masses of people in old China. We have set up several hundred thousand enterprises. In 1980, compared with 1952, the year when economic recovery was completed, the gross value of the fixed assets of industry in the country, calculated on the basis of original prices, increased by more than 2,600 percent, amounting to 410 billion yuan. In 1979, compared with 1949, the net value of industrial output increased by 4,200 percent, the net value of agricultural output by 190 percent, and the national income by 730 percent. Simultaneously, posts and telecommunications, trade, science and technology, education, culture, public hygiene, and physical culture have all made great advances. In 1980, in the cities and the countryside, the average per capita consumption level, after deducting price movements, rose by nearly 100 percent compared with 1952. New China has already rid itself of the nickname of the "sick man of East Asia." The average life expectancy has increased form around 35 years in old China to nearly 70 years now. The death rate of the population has dropped from some 30 per thousand in old China to 6-7 per thousand at present. The general level of the poeple's health has markedly improved.

Meantime it should be noted that taking into consideration the large amount of labor power and natural resources expended, we could hardly be satisfied with the above-mentioned achievements. This is because over a rather prolonged period, mainly toward the end of the 1950's and the beginning of the 1960's and during the period of the "great cultural revolution," economic construction in our country was directly affected by leftist errors. Objective laws were violated, the national condition of the country was disregarded and there was too great an anxiety to achieve quick results. Moreover, there were serious errors in macroscopic policy, such as unilaterally stressing the development of heavy industry and neglecting agriculture, light industry, communications and transportation, commerce and the service trades, resulting in the one-sided development of the economic structure and disproportion in the national economy. A highly centralized economic control system also has various defects such as: A unitary type of regulation by planning mechanism (targets fixed by mandates from above) restricts the display of the enthusiasm of the enterprises' staff and workers. This, however, is not the natural result of the implementation of a planned economy. Rather, it comes about on account of the violation of the principle that a planned economy must abide by objective laws. What we are doing now in readjusting the economic structure and reforming the system of economic management is precisely for the purpose of rectifying the above-mentioned errors, ensuring that the socialist planned economy follows a path of healthy development and enabling a better display of the inherent superiority of the planned economy itself.

II. The Socialist Planned Economy And The Market Mechanism

Acknowledging that the present stage of the socialist economy in our country is a planned economy, we must still note that it is not the same kind of planned economy envisaged by Marx and Engels but that, instead, it is a planned economy utilizing the market mechanism. This is because commodity and monetary relations still exist in the socialist stage and the socialist economy, besides possessing primarily a planned character, also has a commodity or market character.

Marx and Engels envisaged that in a socialist economy, commodity and monetary relations were nonexistent. However, in our country and in other socialist countries actual practice has shown that the existence of commodity and monetary relations in the socialist stage is unavoidable.

This objective certainty arises from the following: A socialist society still acknowledges that the disparity in capability between individuals is a "phenomenon of natural endowment." It acknowledges that enterprises or groups of laborers possess relatively independent economic interests, and that between individuals and between groups of laborers, under the prerequisite condition of the uniformity of the basic interests, there still exist relations of economic interests, or rather conflicts of economic interests. This requires regulation governed by the principle of exchange at equal value and in turn determines that the socialist stage must still retain commodity-monetary relations embodying the basic characteristic of exchange at equal value.

It is very important to accept the concept of a socialist economy retaining the commodity feature. One of the reasons why in the past our planned economy did not fare well and could not convincingly display its superiority was the refutation of the commodity character of a socialist economy and the disregard of the role of the law of value. Our past economic management system was in effect edging out the market mechanism. As a result, control of the economy was too tight. It was literally strangled and the entire national economy could not operate freely. Touching on the need for seriously reforming our country's economic management system, the communique of the 3d plenary session of the 11th CCP Central Committee specially pointed out the importance of giving important attention to the law of value. We take this to be a pointed reference to the defects in the past planned management system of our country.

This being the case, how should the socialist planned economy utilize market mechanism? Or rather: How should we handle the relations between the plan and the market, that is to say, the relationship between regulation by planning mechanism and regulation by market mechanism?

First, since a socialist economy is a planned economy, regulation by planning mechanism must be implemented in the macroeconomic sector. In other words, regulation by planning mechanism or planned management must be enforced and incorporated in the medium and long-term plans of the state, concerning such aspects as the direction, target and speed of development of the national economy, growth of the national income and its apportionment between accumulation and consumption, the proportionate relations between agriculture, light industry and heavy industry, the distribution of the productive forces, the gross amount of capital construction investments, the direction of such investments and the major construction items embodied, the technology policy, the energy policy, the elevation of the people's income and level of consumption, the gross volume of funds for wages, the balance of finance, credit and loans, material resources and foreign exchange, and the overall balance between them, the general price level and the price level of the major products, and so forth. Only when the policies on the above-mentioned aspects have due regard for China's national condition and are in agreement with the objective economic laws can there be assurance for the planned development of the entire national economy and can the national economy avoid big mishaps. Moreover, good conditions can thus be generated for a benign cycle in the social economy as well as for the normal production and operation of the basic-level enterprises.

At present, in further readjusting the national economy and in the aspect of regulation by planning mechanism of macroeconomics, it is most important to determine the ratio between accumulation and consumption in the sector of the national construction and the people's life. Concretely speaking, the following points should be noted:

First, do not allow the sum total of planned accumulation and consumption to exceed that of the national income, otherwise this will result in fiscal deficit. In such an eventuality, more banknotes will have to be issued. There will be currency inflation and a rise in commodity prices. Economic stability will be adversely affected.

Second, do not make the accumulation rate too high. For the present, it should be around 25 percent. China has a population of 1 billion people of whom 800 million are peasants and the level of production and income is very low. In 1979, the average per capita national income was only $253, equivalent to only one-tenth or so of that in the developed capitalist countries. When formulating our plans, we should pay attention to the people's life, so that the people will actually be benefited in the course of production development and their income and consumption level will be elevated. According to actual practice over the past 30 years of socialist construction, the accumulation rate in the first 5-year plan period was 24.2 percent and that in the 3-year readjustment period in the 1960's was 22.7 percent. During both periods, production developed speedily, the country grew steadily in strength, and the people's life was improved. On the other hand, during the periods of the second and fourth 5-year plans, the accumulation rate was in excess of 30 percent, and the growth rates in industrial and agricultural production were only 0.6 percent and 7.8 percent respectively. There was practically no improvement in the people's standard of living. It can thus be seen that fixing the accumulation rate at around 25 percent is appropriate.

Third, there should be strict contol of the accumulation funds. Emphasis should also be laid on the control of capital consturction investment. Experience has shown that frequently the purpose of raising the accumulation rate was to increase capital construction investment. In order to further readjust the national economy, the party and the government have decided to reduce the 1981 capital construction investments to 30 billion yuan, a reduction of over 40 percent compared with the 53.9 billion yuan in 1980. This represents a measure to lower the accumulation rate and thus to balance revenue and expenditure in the budget and in credit and loans. The experience of many socialist countries has shown that it is frequently difficult to keep capital construction investment under control. In addition to resorting to administrative intervention measures, we must build several lines of defense based on economic interests to prevent the plan being disrupted. For example, the method of handling capital construction investment may be changed from direct financial appropriations from the state to bank loans. The bank should strictly control the gross amount of loans for investments and impose stringent terms for the loans. In addition, a construction tax may be imposed. At the same time, capital construction investment should be rationally distributed among the various departments of the national economy. The orientation of investment should be so selected as to be beneficial to the rational readjustment of the production structure.

Fourth, the consumption funds must also be arranged well and in a planned manner. Emphasis should be laid on controlling the rise in social purchasing power. The reason for the large fiscal deficits in 1979 and 1980 was due, in addition principally to the failure to adequately cut back capital construction investment, according to plan, to the rise in social purchasing power far exceeding the original plan. Between 1970 and 1978, the social purchasing power averaged a yearly increase of 9.1 billion yuan. In 1979, the increase was 24.1 billion yuan while in 1980, it was 34 billion yuan. (After deducting the portion attributable to the rise in commodity prices, over these 2 years the increase was over 20 billion each year.) In both cases, the increase surpassed the increase in the volume of supply of commodities to the society. At present, in order to curb the rise in social purchasing power, we must resort to such measures as stopping the indiscriminate granting of awards and subsidies, strictly controlling the extent and volume of negotiated purchases of products, surpressing the purchasing power of the collectives, and so on.

Simultaneously, we should continue to fix targets by means of directives in regard to the important microeconomic activities such as the production and purchasing of products with a bearing on the national economy and the people's livelihood and of those products which are important but are in short supply and the principal production and marketing activities of the large backbone enterprises. In the course of readjusting the national economy, no matter whether we are promoting the production of consumer goods or reorganizing the industrial or commercial enterprises, we should strengthen regulation by planning mechanism. However, following the gradual harmonization of the proportions of the national economy and the gradual implementation of reform of the economic management system, planned guidance should replace directive planning for the economic activities of enterprises as much as possible.

Following the enforcement of the necessary regulation by planning mechanism in the sector of macroeconomics (in the current readjustment period direct regulation by planning mechanism is still necessary in regard to certain important macroeconomic activities) and subject to the prerequisite of economic stability having been reasonably ensured, we shall be relatively free to promote regulation by market mechanism under planned guidance and make use of the market mechanism to enliven the entire socialist economy.

The principal contents of regulation by market mechanism should comprise at least the following:

Changing the system of state monopoly for purchase and marketing of a large number of products. Except for a small number of important commodities the supply of which lags behind demand such as grain and cotton cloth, for commodities in general the commercial departments should formulate purchase plans on the basis of market needs. In the capacity of relatively independent producers of commodities, production units should be empowered to produce and market products on the basis of social demand (orders placed by commercial departments or market needs). The fruits of the production and operation of enterprises should be closely related to the material interests of the staff and workers of the enterprises. As for the kinds of sundry goods which can be marketed locally, the enterprises can directly handle their trading without going through wholesale organs or retail stores. Certain products can also be marketed by the enterprises themselves by means of their own retail sales departments. Commercial departments should carry out the system of selective buying. They should be empowered to refuse to purchase products that are unmarketable. Those products which the commercial departments do not purchase can be marketed by the enterprises that produce them. Thus will help in solving the longstanding problem of certain products being out of stock and of certain other products being stockpiled for a prolonged period.

Gradually allowing a large proportion of production materials onto the market. Since 1979, certain cities and towns ahve set up markets for tarding in production materials. This has enabled many plants to sell in the markets products which had been kept in warehouses for many years. This not only reduced the quantity of goods stored in the warehouses but also satisfied the needs of a certain portion of the enterpirses in need of these products. The entry of mechanical and electrical goods onto the market has induced the manufacturing units initially to turn out products suitable for the market. As a result, many enterprises have evolved from not having enough business to having more business than they can handle, and the economy has been enlivened. As yet, not many production materials have entered the market. Only a little over 10 percent have done so, but notable results have already been achieved.

Increasing the channels of circulation, reducing the intermediate links in circulation and avoiding monopolizing by a single enterprise constitute the main jobs in implementing regulation by market mechanism. In the past, the supply and marketing cooperatives were not allowed to enter the cities while the commercial departments could not go to the countryside. At present, not only can the supply and marketing cooperatives extend their operations into the urban areas but also the communes and the production teams can go to the cities and sell their products in the markets for agricultural and sideline products. Likewise, commercial departments and certain plants can go to the countryside to market their consumer durables. Moreover, outside of state-operated commerce, a batch of collectively-owned commercial units and a small number of individually-owned commercial units have been steadily developed and allowed to compete with each other while state-operated commerce no longer monopolizes the market.

Implementation of regulation by market mechanism requires that the unitary planned pricing system be changed. In the past, the prices of several thousand types of products could not change to conform with changes in the situation of market supply and demand and so it was impossible to talk about regulation by market mechanism. In order to put regulation by market mechanism into actual practice, the power of the central departments to control prices, with the exception of few products, should be gradually handed down. The central government and the localities should still have certain power to fix prices, but wherever possible the power of price adjustment should be gradually delegated to the enterprises. At the same time, the unitary planned pricing system should be changed to a system of multiple prices. Planned pricing should still be retained by the state concerning the purchase and sale of major agricultural products, the ex-factory prices and sales prices of fuel, energy and the principal raw materials, and the charges or rates of railroad, civil aviation, posts and telecommunications and major water transport. Also simultaneously, people's governments at various levels, such as the state, provinces, municipalities and autonomous regions should sanction theoperation of certain floating prices, the extent of which should be gradually widened in accompaniment with the development of the national economy. Within the scope limiting the kinds of product and the extent of the price fluctuation sanctioned by the state, the enterprises exercise the full right of price fixing should be generally adopted.

Naturally, regulation by market mechanism must proceed under planned guidance. Since markets are widely dispersed and do not follow any definite plan, in regulation by market mechanism, we not only must study the possible effects and study how to make the dispersal more rational, which dispersal form is better, and so on, but also must estimate the possibility that following the implementation of regulation by market mechanism, production and marketing might develop blindly to the detriment of the state plan. This requires that planned guidance and market management be strengthened and that the extent of regulation by market mechanism be stipulated.

Historical experience has told us that socialist planned economy must make use of the market mechanism. Especially in our country, in the past the commodity was very much undeveloped while at present the level of the productive forces of society and the degree of socialization of production are both still relatively low. Planning cannot attend to each and every aspect. Hence, it is necessary to earnestly develop a socialist commodity production and commodity exchange, and there is a need to utilize the market mechanism to enable production and demand of the enterprises to be linked together of their own accord. Even though the level of the productive forces and the degree of socialization of production have been raised considerably. It could hardly be imagined that the central planning organs could, by reliance on such instruments as electronic computers, attain on time sufficient and adequate reference data to make detailed arrangements which conform with reality for the production, supply and marketing activities of the hundreds of thousands of enterprises and covering their several million kinds of products. The advantages of regulation by market mechanism are its nimble features and its competitive character. It can quickly and spontaneously respond suitably to changes in demand on the part of the consumers and thus by means of quick, adjustment can make the socialist planned economy more nimble and effective. Hence, in a socialist economy, the use of the market mechanism is a necessity to make the operation of the economic organism more lively. Over the past 2 years, we have practiced regulation by market mechanism to a certain extent and within a limited scope (according to incomplete statistics, in 1980 the proportion occupied by regulation by market mechanism was roughly as follows: in the production sector, the proportion occupied by products marketed by the industrial enterprises themselves was 19.5 percent of the gross value of sales of goods for civil use of the whole country; in the circulation sector, the portion covered by regulation by market mechanism occupied 25.3 percent of the gross volume of retail sales of commodities of the whole country; of the gross volume of agricultural and sideline products purchased by the commercial departments, purchases made outside the plan on negotiated prices or on increased prices for purchases in excess of the quota occupied 34 percent). This has greatly enlivened the socialist economy and the national economy has been able to continue a relatively speedy development in the course of readjustment, while the standard of living of the people has been improved considerably. This illustrates that the utilization of regulation by market mechanism in a socialist planned economy can, on the one hand, ensure the proportionate development of social production and prevent the enormous waste in social labor power seen in the anarchistic state of capitalism. On the other hand, the socioeconomic activities are not strangled to death by rigid control. Instead, they become lively and vigorous and are imbued with vitality. In this way, the superiority of the socialist economic system can be better displayed.

III. Several Important Conditions Ensuring The Development Of Socialist Planned Economy

The conditions are indeed many, but only three of them will be discussed here:

First, policy making in macroeconomics must conform with objective laws and the national condition.

Under a socialist planned economy, the direction of development of the national economy is generally determined by the social center or the state. This being the case, whether or not a macroscopic policy is correct exercises important influence on the development of the social economy. Only when the macroscopic policy conforms with the objective laws and with the national condition can the smooth development of the socialist planned economy be assured.

Since the 30 plenary session of the 11th CCP Central Committee, the extensive masses of economic workers and economic theorists in our country have seriously studied and summed up the experiences and lessons learned from the socialist construction since the founding of the republic in conjunction with the work done in readjusting the national economy and reforming the economic management system. They have earnestly striven to find a new road which conforms with objective laws and the national condition of our country, in order to put the macroscopic policy in a correct posutre. Following the elimination of the effects of leftist errors in economic construction and the formulation and thorough implementation of a series of guidelines and policies, the socialist planned economy in our country has really been taking new strides forward under the guidance of a correct macroscopic policy. The following points are worth noting:

Concerning the targets and speed of development, we are no longer following the past practice of striving for high speed or high targets in our gross output value and in regard to certain products. On the contrary, the objective set was to improve the material and cultural living of the broad masses of people. The economic and social development plans were formulated according to the principles of acting according to our capability and working strenuously. In so doing, from a long-term view, the speed of economic development will not be slow but relatively rapid while the actual benefits to the people will not be reduced but rather increased.

In selecting the composition of the economic structure, we have gradually changed the situation characterized by an over-emphasis on heavy industry, the frailness of agriculture, light industry and the energy sector of heavy industry, and the insufficient capacity of communications and transportation. We have also speeded up the development of the commercial service trades and the cultural, scientific, educational and public health enterprises. In readjusting the economic structure, we have placed importance on developing the production of consumer goods. Conforming with the state of development of the productive forces and our national condition, we have changed the construction guideline from giving priority to development of heavy industry with steel as the leading factor to stressing the development of production of consumer goods and giving priority to developing light industry within a fixed period. This is aimed at rectifying the irrational production structure of over stressing heavy industry and not stressing light industry enough which had been the case in the past under the influence of leftist ideology.

In regard to the form of production development, we have changed the former practice of unifiedly striving for quantitative target, simply relying on building new projects, putting up new structures, and increasing the consumption of energy and raw materials. Instead, we have reverted to such forms as stressing quality and results, relying on the existing enterprises to tap potential, renovate, restructure, improve labor productivity and economize in the consumption of energy and raw materials. In addition, we have constantly demanded improvement in the quality of products and making them marketable, in order to effect savings in capital funds, reduction in production cost, and increase in profits. In other words, we have shifted expanded reproduction by extension to expanded reproduction by intension and from extensive operation to intensive operation.

Second, we must be good at using various kinds of economic mechanisms so as to enable the socialist planned economy to operate smoothly and dexterously.

To ensure the smooth development of the socialist planned economy, it is not sufficient to have only a macroscopic policy. We must still be adept in the use of various kinds of economic mechanism so that the correct macroscopic policy may be firmly implanted in the various economic activities and achieve the desired results.

In the last few years, in the course of readjusting the national economy and reforming the economic management system, we have readily seen that because of certain mechanisms being out of order, the correct macroscopic policy of the state could not be well implemented. For example, in 1979 and 1980, for the sake of improving the people's standard of living, the fiscal expenditures for the purchase of agricultural products and for wages and salaries were increased. In the hope that replenishments could be made from reducing the investment in capital construction. Unfortunately, for various reasons, the plan to reduce capital construction investment outlay could not be realized. As a result, large budget deficits were incurred. Furthermore, because of the inability to bring into full play the functions of market under planned guidance, there appeared such abnormal phenomena as the small squeezing out the big, the backward squeezing out the advanced and the new squeezing out the old.

It appears that in the readjustment period, in order to strengthen the centralized and united leadership over the national economy, it is necessary to adequately stress the role of the planning mechanism so that the economic structure can be speedily and rationally readjusted. But in the long term, it is necessary to create the requisite conditions for the market mechanism to fully display its role. Nonetheless, be it now or in the future, the planning mechanism and the market mechanism must be in unified operation. The problem is under given conditions how to find the best form of unifying them so that the superiority of the socialist planned economy can be better displayed.

Third, that the socialist state-run eocnomy occupies the leading place in the national economy is a material prerequisite to ensure the development of the socialist planned economy.

Marx said: "The concentration of the production materials of the whole country will form the national foundation for society comprising a united body of producers of a free and equal status; in accordance with a commonon and rational plan, these producers will consciously pursue their work in the society" (Marx: "On Land Nationalization," Collected Works of Marx and Engels, Vol 18, 67). If society does not own the means of production and if the economy under the socialist-public ownership system (the economy under the system of ownership by the whole people or its concrete form in a socialist state-run economy) does not occupy a superior or leading position in the national economy, the social center or the state will lack the necessary material support and power to carry out regulation by planning mechanism. In the initial period after liberation, if we did not have in our hands large quantities of grain, cotton and other products to dominate the market we could hardly have emerged victorious in the struggle with the capitalists for the control of the market. We could not have stabilized the incessantly rising commodity prices or created the conditions for planned construction.

In order to ensure the proportionate planned development of the socialist economy and to enable the social center and the state to have in hand the necessary material resources and support for implementing regulation by planning mechanism, an important condition is to concentrate in the hands of the social center or state the major portion of the surplus products (M) created collectively by laborers of production enterprises under the system of ownership by the whole people. Concerning this problem we are basically in agreement with the viewpoints of comrade Sun Yefang (Sun Yefang: "On Several Prerequisite Conditions For Doing A Good Job Of Overall Balance," Jingji Yanjiu No 2, 1981).

Concentrating in the hands of the social center or the state the major portion of the surplus products collectively created by laborers of enterprises under the system of ownership by the whole people has the following advantages:

1. The state can control the major portion of new investment for use in solving the strategic problems of development. This helps in the realization of regulation by planning mechanism in Marco economics, in dominating the orientation of development of the national economy, and in providing assurance for the planned proportionate development of the national economy. Some people have suggested that for the state to control the major portion of new investments tends to encourage blind guidance and blind investments and that this may unbalance the national economy. In reality, what is of key concern here is whether the guiding indeology is in the right direction or not. If it is, then the proportionate planned development of the national economy can be realized in an even better manner. If not, such as shown in blindly striving for high speed, then even though the surplus products are not under the control of the state but are in the hands of the localities or enterprises, blind investments can be engendered just the same. This will inevitably lead to a certain state of anarchism and disproportion.

2. The state is enabled by means of the control over the capital construction investments to control the accumulation funds and the accumulation rate. Having the new investment funds concentrated in, and used by, the state as opposed to having them dispersed among, and used by, the localities and the hundreds and thousands of enterprises, facilitates control and regulation. In certain socialist states, due to their enterprises having control, and exercising the power, to dispose of the major portion of their net income, the problem of having an overextended capital construction front has confronted them for a prolonged period, thus seriously

affecting the harmonious development of the national economy. Over the last 2 years, the trial points for reform of the economic management structure in our country have likewise shown a strong tendency on the part of the localities and enterprises to blindly use their funds on capital construction investments, a situation which is hard to control.

3. We must prevent the laborers of enterprises from collectively converting in large quantities the surplus products derived from the means of production owned by the whole people into new funds for developing production, thus aggravating the state of disparity in income and earnings. This is all the more necessary when the price and taxation systems have not yet been rationally reformed. At present, due to the differences in prices and tax rates, among enterprises producing and handling different varieties of commodities there is a great disparity in the amount and level of profits. This literally results in misery and joy being unevenly apportioned. Those earning high profits may not necessarily have expanded intensive labor or possessed an exceptionally high standard of management. If it happens that a large quantity of the surplus products of the enterprises (their profits) are retained by the enterprises, then they may be converted into new production development funds for use on such things as technological restructuring. This will further aggravate the disparity between misery and joy. Even if systems of pricing and taxation have become more rational (including the levy of a resource-disparity tax and readjusting the disparity in income among the grades), and even if the profits and their level do adequately reflect the standard of management. The greater proportion of the surplus products of the enterprises should still be given to the state. If this is not done, then following the steady increase in the production development funds which in effect represent the independent interests of the enterprises, the factor of collective ownership by the enterprises will steadily grow in importance. This is disadvantageous to the gradual realization of the socialist principle of everybody being equal with regard to the means of production. It may now be asked if what we suggest above might affect the development of production on the part of the enterprises. The answer is no. Within the extent of the original capital funds (plus a small amount of production development funds derived from the profits of the enterprises) the enterprises can still engage in technological renovation and restructuring, tap production potential and increase the variety and output of products. If an enterprise has big prospects for development, the state can well arrange the granting of new investment funds for the purpose of expanding the scale of production and undertaking technological restructuring.

4. We should implement better the principle of distribution according to work and prevent a portion of the laborers from not depending on work but rather on capital to earn a larger income. Marx and Engels conceived that the first stage of communism should call for implementing throughout society the principles of distribution according to work and an equal quantity of labor for an equal quantity of products. Naturally, we are incapable at the moment of doing this. But we must earnestly implement the principle of distribution according to work, or at least endeavor to gradually approach that goal, and should not go in the opposite direction. If the surplus products produced by the enterprises do not primarily belong to the social center or the state but are placed at the disposal of the enterprises themselves, it will in reality be tantamount to converting this portion of funds into a source of increased income for the staff of the enterprises. In turn, it would artificially, and rather inappropriately, widen the disparity in the earnings of the laborers. This would violate the principle of distribution according to work, or rather increasingly go against the socialist principle of distribution.

In our opinion, the leadership position of the economy under the system of ownership by the whole people can hardly be shaken if a large part of the surplus products of the enterprises owned by the whole people are given to the social center or to the state. This will be true even if a portion of the handicraft enterprises and small enterprises of commercial or service trades owned by the whole people are contracted out or rented to groups of employees and workers or to individuals for their operation and even if the collective economy and a small quantity of individual economy flourish in the cities and towns. Nor in such a case will planned management or regulation by planning mechanism be shaken. On the contrary, it will only further enliven the socialist economy and bring into fuller play the superiority of the socialist economic system.

ECONOMIC MANAGEMENT

CHEMICAL PLANT RAISES PROFITS THROUGH IMPROVED MANAGEMENT

Beijing RENMIN RIBAO in Chinese 5 Nov 81 p 1

[Article by Gao Baosheng [7559 0202 3932], Yang Zhenwu [2799 2182 2976]]

[Text] Abstract: The Zunyi Chemical Plant No 2 has rapidly increased profits since 1978 by cutting the consumption of raw materials and production costs.

While the total value of output over the past few years at the No 2 Chemical Plant in Zunyi, Guizhou Province, has not risen, profits have risen greatly, from 121,000 yuan in 1978 to 429,000 yuan in 1979 and 600,000 yuan in 1980. A 422,000 yuan profit has already been achieved for the first 8 months of 1981, 14 percent higher than for the same period of last year.

The Zunyi Chemical Plant No 2 is a small plant with only 300 employees. Its main products are gallic acid, pyrogallic acid, tannin extract, and other organic chemical products. Since the flow of raw materials has not been smooth in recent years, plant production has often been below capacity, the total value of production fluctuating around 3 million yuan. To make a greater contribution to the state, they focused emphasis on reducing the consumption of raw materials and on production costs. They apportioned cost targets to each shop, and from the shops to teams, groups, and individuals; formulated team estimates and station estimates; and, on the basis of these data, set up the overall method of quota checks. In this way, the managerial result and income of staff and workers were directly integrated and management of the enterprise became better and better. The gallic acid shop formerly was able to produce only 15-16 tons of gallic acid from every 50 tons of nutgall, an almost profitless operation. A thorough check was made, and responsibility for costs were assigned. After economizing, they reformed the technological process and increased the sense of responsibility during operation, as well as collecting products washed away as the "three wastes" [waste gas, waste water and industrial residue]. Now 19 tons of product can be produced from the same 50 tons of raw material. In this way alone each month's income has increased by more than 30,000 yuan.

SUBSTANTIAL INCREASE IN SHANGHAI SAVINGS DEPOSITS REPORTED

Shanghai JIEFANG RIBAO in Chinese 30 Sep 81 p 1

[Article: "240 Million Yuan in Funds Taken In in 9 Months"]

[Text] This city's 274 People's Bank savings offices are doing everything possible to bring about an increase in saving, and in the first 9 months of this year they have already taken in 240 million yuan in savings deposits, while new accounts have increased by 1,050,000, of which more than 80 percent are time accounts. As of 25 September, total savings on deposit citywide amounted to 2.89 billion yuan, an increase of 1.45 billion yuan from the end of 1976, which is equivalent to 3 times the total increase during the 10 years of the Cultural Revolution.

The People's Bank has made available various forms of deposit in order to make society's dispersed and tied-up funds flow more freely into the banks. As a result of the consumers' need for a specific total in order to acquire costly commodities, the banks have instituted a small deposit, lump-sum withdrawal method in which "with monthly deposits of 15 yuan, after 5 years the principal and interest total 1,000 yuan, or with monthly deposits of 26 yuan, after 3 years the principal and interest total 1,000 yuan," which has been welcomed by the masses. Because some employees are too busy at their jobs to go to the banks and deposit their money, small deposit, lump-sum withdrawal savings has been instituted in various organizations, with the funds being held by the finance office until maturity and then paid out by the finance office, with the result that employees can save every month without leaving the factory to go to the bank. By the end of September, nearly 10,000 organizations citywide had instituted collective savings. In order to increase the ability of savings activity to guide consumption, the People's Bank has also instituted "tourism savings." This year it has also added 50 new offices and converted 17 offices to the two-shift system, thereby increasing the amount of time during which it provides its services. The Jing'anshi savings office, which is the country's largest and which is open day and night, has adopted the "large office, small operations" form in which the main office is divided into five small offices, with the result that the time required for deposits and withdrawals has been nearly halved.

SAVINGS DEPOSITS, LOAN REPAYMENTS INCREASE IN RURAL AREAS

Kunming YUNNAN RIBAO in Chinese 27 Aug 81 p 1

[Article by Wang Zuzhe [3769 4371 0772]: "Another Proof That the Situation in the Farm Villages Is Getting Better: Repayments on Loans and Savings Deposits in Farm Villages Throughout the Province Increase on a Large Scale"]

[Text] Up to the end of July, the province's agricultural banks and credit cooperatives received total payments of 201.63 million yuan due on agricultural loans, 46.16 million yuan more than in the same period last year, an increase of 30 percent. Savings deposits of commune members in farm villages reached 170.03 million yuan, an increase of 48.65 million yuan over the same period last year, an increase of 40 percent.

During the first 7 months of this year, the increase in the repayment on loans and savings deposits and the repayment of credit was great; the amount was the largest in history, reflecting the good situation that has emerged in the farm village economy. Since last winter, Tengchong County's Jietou Commune Credit Cooperative has actively encouraged the production teams and commune members to plant more rape. This year, the whole commune produced a total of 3.8 million jin of winter rape, an increase of one-fold over the previous year, and it realized an income of 2.20 million yuan. The per capita income of the whole commune from rape alone was 47 yuan. Up to the end of June, the credit cooperative of the Jietou Commune received over 770,000 yuan in repayment of loans, 440,000 yuan more than that retrieved during the same period of the previous year. The commune members repaid 200,000 yuan on loans, an increase of 150,000 yuan over the same period last year. At the same time, commune members saved over 770,000 yuan, an increase of 490,000 yuan over the same period last year. The agricultural bank and the credit cooperative of Xuanwei County suited measures to local circumstances and provided loans to support the production teams and commune members in developing hog raising and providing raw material for "Xuanwei ham." From January to May of this year, the whole county purchased 67,134 fattened hogs, an increase of 18.4 percent over the same period last year. After the commune members sold the fattened hogs, they repaid 1.30 million yuan of the loans, an increase of 454,000 yuan over the loan money retrieved during the same period last year, an increase of 53.6 percent.

As the economic situation in the farm villages developed, the agricultural banks and credit cooperatives at each locality changed their style of work, improved their working method, and further established the positional responsibility system and the management responsibility system. They went deeply into the teams and the families to strengthen propaganda, provided improved service, provided convenience to the masses and exerted efforts and to do the work of collecting loan repayments and collecting savings deposits well.

COAL EXCEEDS PLAN QUOTAS--NCNA, 1 Nov 81--Following the surpassing of the State Plan for September [1981], the nation's coal industry continued to increase its output in October. This month's overall production of 51,430,000 tons of raw coal and 4,310,000 tons of washed coal exceeded the State Plan by 7.9 percent and 4.3 percent respectively. The opening up of tunnel footage also exceeded the Plan by 11,400 meters. While the coal output increased in October, the mining sector also completed the overhaul of some 862 projects which had been out of production. This was the biggest month for overhauling work since the beginning of the year. These projects provide the foundation for production not only for the fourth quarter, but for next year as well. BRIEFS

BEIJING TV PRODUCTION--Beijing, 16 Oct (XINHUA)--Beijing's two television factories produced nearly 750,000 color and black-and-white TV sets from January 1978 through the end of September this year. In the 8 years from 1970 through 1977, total output was only 36,000 sets, according to the local radio and television industry department. Output between January and September this year was 310,000 sets. Quality of TV sets has improved markedly. Beijing-made TV sets can now operate from 1,500 to 2,000 hours without needing repairs, as against 600 to 700 hours before 1978. One "Kunlun" model black-and-white TV set has a 5,000 hour repair-free life span. There are now seven TV production lines in the capital with an annual capacity of 500,000, compared with only two lines with an output of 30,000 before 1978. 'JINGJI GUANLI' DISCUSSES PRINCIPLE FOR CONSTRUCTION

HK161413 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 81 p 10

[Short commentary by Liu Wei [0491 0251]: "A Major Question in the Guideline for Construction"]

[Text] It is a major question in the guideline for construction whether to rely on "extension" or "intension" in developing the economy. The so-called "extension" means to expand productive force through building new enterprises while the so-called "intension" means to rely on technological restructuring by the existing enterprises. In fact over the past many years we mainly relied on "extension" by using our limited financial power in building new enterprises. Under the "10-year set system" and even "decades set system," no measures were taken to renew and restructure old enterprises and we relied on old equipment in producing old products. It has been proven in history that such an unconscious wrong guideline has seriously hampered the development of the economy of our country.

At present, the principle for further readjusting the economy is being implemented and such a measure is imperative. But readjustment is an active and progressive principle and it does not mean mere "retreat." Retreat must be coupled with advance and downs must be coupled with ups. Basically, advance and ups are the dominant aspects. If we only pay attention to retreat and neglect advance and only pay attention to reducing expenditures and neglect to broaden the sources of income, we will eventually push the economy into a blind alley and even cause vicious cycles.

It is natural that with readjustment, the development of the economy will slow down a little, but that does not mean the slower the better. We must maintain a certain pace of development so that we will be able to develop the economy stably. What is the way out? An important way is to change the guideline centered around new construction and extension to the guideline with technological restructing and intension as the main. That is to say, we must carry out an overall technological restructuring of our national economy in a planned way and step by step. Some leading comrades from the Party Central Committee and the State Council recently reiterated this strategic change in the guideline for construction. Practice has proved that such change will have a far-reaching impact on the development of our economic construction.

Is not the technological restructuring of the existing enterprises contradictory to the implementation of the principle of readjustment? Yes, it is. We have to spend some money in carrying out technological restructuring but the economic effect of such technological restructuring is much bigger than building new enterprises. In addition, technological restructuring will make heavy industrial departments such as the machine building industry and metallurgical industry more active. Such a situation exactly represents the active readjustment which is both retreat and advance.

Reducing expenditures is important in improving the current financial situation but what is more important is to broaden the sources of income. It is very difficult to solve financial difficulties by solely relying on reducing expenditures. Comrade Mao Zedong pointed out long ago that it is necessary to oppose a purely financial view. Even today it is still imperative for us to avoid the tendency of such view.

This issue of this magazine also carried an article by Comrade Chen Yi and an article by the Fusun Municipal Financial Bureau in introducing their experiences. We hope that readers will read these articles which are in the interest of further understanding the principle of "readjusting, restructuring, reorganizing and upgrading."

'JINGJI YANJIU' DISCUSSES RURAL FAIR TRADE

HK070320 Beijing JINGJI YANJIU in Chinese No 9, 20 Sep 81, pp 38-41

[Article by Yang Yingyuan (2799 2819 3104): "The Effects of Rural Fair Trade on the Amount of Currency in Circulation"--a survey report of Huang Yan County, Zhejiang Province]

[Text] In Shejiang Province, Huang Yan County ranks as a county with a comparatively well developed rural fair trade. In 1979, while the rural fair trade of Zhijiang Province accounted for 16 percent of the total provincial social commodity retail trade, the percentage in Huang Yan County was 23 percent in this respect, exceeding the provincial average level. In order to understand the influences of rural fair trade on the volume of money in circulation, we visited Huang Yan County in October 1980 to conduct this survey.

Features Of Economic Geography And The General Situation Of Money Circulation In Huang Yan County

Huang Yan County is a region marked by its integrated economy which has grain as its chief product. Its total area is 1,459 square kilometers, with 70 percent of total area mountainous areas, 10 percent lakes and rivers, and only 20 percent arable land. Total acreage under cultivation at present is 607,000 mu. Mountainous areas in use total 1,114,000 mu. Of the cultivated land, 63,000 mu are planted with tangerines, 3,300 mu are planted with cotton, and 492,000 are planted with rice. This county ranks high among the 7 counties of the Taizhou prefecture in economic and cultural development. It has a population of 1,080,800, 90.2 percent of whom are engaged in agriculture. The per capita collective income of the commune members is 107.32 yuan and the income from sideline occupations averages 44.14 yuan per person. Making a total of 151.4 yuan, slightly above the average provincial level.

Huang Yan County has good transport facilities. It offers better prices in its rural fair trading than its neighboring regions and is known for its tangerines and straw mats, which are in great demand. The three most well known marketing towns of this county, Chongguan Township, Luqiao Township and Haimen Township are all historical trading centers of Taizhou prefecture.

Since the founding of our People's Republic, will 1979 extra money had been put into circulation every year with the exception of 1963, during which 294,000 yuan were with drawn from circulation instead. The total money put into circulation during the 30 years amounted to 263.67 million yuan. The amount added during the years from

1954 to 1957 totalled 6,841 million yuan, and average of 1.71 million yuan per year. During 1958 to 1962 20,362 million yuan were added, an average of 4.073 million yuan annually. From 1964 to 1966 15,497 million yuan were added, an annual average of 5.166 million yuan. From 1967 to 1976 152,507 million yuan were added. The average annual input was 21.76 million yuan during the second 5 years of this period exceeding the average annual figure of 8,742,000 yuan during the first 5 years by nearly 150 percent. In 1979 31,357 million yuan were added, topping the historical record of cash injection. The yearly increase of cash in circulation is the inevitable result of economic development and the increase in people's income both in the urban and rural areas. In terms of the money circulating in the markets, the volume also has been increasing. The ration between volume of money in circulation and volume of the social commodity retail sales as well as that between the volume of money in circulation and the volume of commodity inventories have been declining:

Year	Volume of Money in Circulation at Year End	Total Volume of Social Commodity Retail Sales	Commodity Retail Sales Per Yuan in Circulation
	Figures in Million Yuan	Figures in Million Yuan	Figures in Yuan
1954	4,236	34.11	8.05
1965	10,260	74.46	7.26
1975	23,528	90.85	3.86
1978	27,507	147.09	5.35
1979	36,563	182.75	5.00

Year	Commodity Inventories of the Commerce Section at Year End	Commodity Inventory per Yuan In Circulation
	Figures in Million Yuan	Figures in Yuan
1954	10.81	2.55
1965	27.68	2.70
1975	45.195	1.92
1978	65.11	2.37
1979	68.649	1.88

The law of value plays an important role in the development of the rural fair trade. The flow of goods is towards high prices, while the flow of money is towards low prices. This is the law of the movement of goods as well as that of the flow of money. As the state-operated commercial operations and the supply and marketing cooperatives in Huang Yan County have insufficient stock, the market supply of commodities cannot meet the needs of the social purchasing power. As a result, part of the purchasing power flows to Shanghai, Hangzhou, Ningbo and other large and medium-sized cities. In addition to this, large amount of cash flows out of the county through the channel of rural fair trade. Over 31 years, a total of 227.11 million yuan of cash have flowed to other counties. In 1979 alone, the outflow amounted to 22.3 million yuan, about 40 percent of which flowed out through the channel of rural fair trade.

The Characteristics Of Rural Fair Trade In Lu Qiao Township

Since the 3d plenary session of the 11th CCP Central Committee, the implementation in the countryside of the two documents of the Central Committee has greatly aroused the initiative of the masses of the commune members. Consequently, the development of agricultural and side-line production has been greatly increased, and the rural fair trade has been quickly restored. In order to promote the development of the socialist commodity economy, our party and government have formulated more lenient policies, and banks have reformed the regulations of cash management to suit the changes. In consequence, the development of the country market trade has been expedited. Under the jurisdiction of the Lu Qiao District are eight communes and Lu Qiao township. There are eight rural fair in the district. Each one takes it in turn to run a 2 day fair at intervals of 10 days. The market of Lu Qiao Township ranks first in the briskness and size of its trading. The price quotations in this market have an important influence on the neighboring markets. Over the last year, both the volume of goods on sale and the volume of actual transactions has greatly increased.

Having analyzed the development of the rural fair trade in the Lu Qiao District and having conducted an on-the-spot observation of the trade in Lu Qiao Township on 11 October, we found the following characteristics:

1. The rate of growth of the volume of actual transactions of the rural fair was much greater than that of retail sales of social commodities.

In 1979, retail sales of social commodities totalled 16.80 million yuan, and the volume of the actual transactions of rural fair trade totalled 4.67 million yuan. It is estimated that in 1980 retail sales of social commodities would have been 20.20 million yuan an increase of 20.24 percent as compared with 1979, and the volume of the actual transactions of rural fair trade would have been 9.20 million yuan an increase of 97 percent as compared with 1979. The increase of the latter is 380 percent greater than that of the former. In 1979, the volume of actual transactions in rural fairs was 27.8 percent of total retial sales of social commodities. In 1980, the percentage rose to 45.54 percent.

2. Goods in the market were on sale on vendor's stands scattered at random. Gradually, goods of the same kind were grouped together at one place and thus there was competition in pricing.

Before 1978, only a few commodities such as grain and piglets had comparatively concentrated markets in Lu Quia Township. The other goods were sold on vendor's stands scattered at random. Since 1979, peasants visiting the markets have been on the increase and goods on sale in the markets have been more and more abundant. Under these circumstances, the industrial and commercial administration office of the district had to open, in an orderly way, 10 different markets around Lu Qiao Township for grain, piglets, straw mats, flax, firewood and charcoal, poultry, bombooes and lumber, new wood products, aquatic products, vegetables, and waste pro-

Bamboo	28.91	14.46	19.19	13.16	0.56	0.45

(1) Volume of goods on sale.

(2) Volume of actual transactions.

ducts. Very naturally, people have taken these markets as centers for conducting free trade. Both buyers and sellers are benefited by such a convenience. At present, even the miscellaneous daily necessities, handicraft articles, small metal fittings [nails, wires, hinges, bolts, and locks] and certain other products are grouped together for sale on the sidewalks, section by section, in Lu Qiao Township. In this way the buyers can compare the quality, the beauty, and the prices, while the sellers can also promote their sales by offering good quality, fine products, and cheap prices.

3. The development from supplying each other's needs to wholesale trade.

In the past, the rural fair trade was of the nature of supplying each other's needs. Now, a considerable portion of the rural fair trade is in the form of wholesale trade. Of the transactions on 11 October in Lu Qiao Township, about 40 percent involved wholesale trade for one party (either the buyer or the seller). For example, approximately 80 to 95 percent of the lumber, bamboostems, bamboo and wood products, aquatic products, seeds, waste products, cigarettes and certain other products peddled are from outside the township, while more than half of the miscellaneous daily necessities. Industrial products, small metal fittings and so on are sold in wholesale to places outside of the township.

For this reason, the goods for sale are not fragmentary and in small quantities, but are in large batches and quantities. The prices are also of two kinds, the wholesale price and the retail price. Some of the sellers even forge dealings in retail prices altogether, and deal in wholesale prices only. Production on a large scale and sales on a wholesale basis are changing the characteristics of the rural fair trade here.

4. Development from spot dealing to forward trade.

Some of the traders from other counties and places outside of the district make good profits by peddling pillows, bamboo strip mats, shoes of synthetic leather, scrubbing brushes, wire hair pins for women, aluminum finger rings and certain other products made by some commune-member households in places outside the township. These peddlers usually look for sellers in these markets, place large orders, and require a definite delivery date and place for a specified amount of goods, and transactions are to be concluded as specified. For example, one trader from outside of the township asked for 100,000 aluminum finger rings (the wholesale price ranged from 0.8 to 1.6 fen), but the seller had only 20,000 in stock. An agreement was made to deliver the order in 3 days. Some of the peddlers also visited the homes of the commune members to negotiate their contracts.

5. Outsiders have notably increased in the prospective buyers and sellers.

According to the estimates of the industrial and commercial administrative office of the district, on 11 October more than 70,000 people visited the markets in Lu Qiao Township, of whom about 30,000 came from the township itself, another 30,000 from within the county, and 10,000 from other counties. The local people go to the fair to supply each other's needs. Their transactions are numerous in number, but small in value. Some of the outsiders also go to the fair to supply each other's needs, but they go there mainly to peddle goods for resale and their transactions are large in terms of value.

With the expansion of the volume of transactions, the amount of cash involved in the rural fair trade becomes larger and larger. This is reflected in the notable increases of cash deposits and payments recorded by the banks. In 1979, the total amount of cash deposits in the Lu Qiao office of the People's Bank was 23.37 million yuan, and cash payments were 25.31 million yuan. In comparison with 1978, this represents increases of 33 percent and 37 percent, respectively. From January to September 1980, cash deposits amounted to 24.22 million yuan and cash payments were 24.57 million yuan, registering increases of 46 percent and 37 percent respectively in comparison with the same period in 1979, and both show a tendency to increase further.

Calculation Of The Volume Of Money In Circulation Needed By The Rural Fair Trade

The main indicator usually used to test the normalcy of the volume of money circulation is the ratio of the volume of money in circulation in the market to the total volume of social commodities retail sales. However, under the guidance of state planning, with the increasing importance of the market adjustments, the volume of trade transactions of the rural fair trade is constantly increasing. This being so, the further use of the simple ratio of the volume of money in circulation in the market to the total volume of retail sales of social commodities to test the normalcy of the value of money circulation obviously lacks accuracy. Although the rural fair trade is just exchanges transacted among the masses, they are an indispensable supplement to the planned economy. Since the rural fair trade involves cash transactions, goods are necessarily transferred from one party to another, and money in the reverse direction. As long as there is such trade, there will be certain amount of cash involved in it. While this amount of cash is closely related to the normal volume of money in circulation, it is at the same time a separate entity existing outside of the volume of normal money circulation. It is of practical significance to calculate them separately in order to test the normalcy of money in circulation in the market.

To calculate the volume of money circulating in the rural fair trade, Marx's equation of money circulation should be used:

The volume of money (cash) circulation in the rural fair trade equals: the total volume of transactions in rural fair trade divided by the number of times money (cash) turns over in the rural fair.

In this equation, the total volume of transactions in the peasant market trade is a known quantity, while the volume of money (cash) circulation in the market trade is the unknown quantity which is sought. In this case, finding the number of times money (cash) turns over in such a trade is crucial to the seeking of this unknown quantity. Taking into consideration the fact that the inventories of the state-run commercial operations and the supply and marketing cooperatives are insufficient and hence the shortage of commodity supply in meeting the needs of purchasing power, we can come to the conclusion that the annual turnover of money in circulation in these operations is comparatively slow. In the case of the rural fair trade, things are quite different. The total volume of goods on sale is larger than the total amount of actual transactions. Generally speaking, it is not a case of insufficiency of supplies, but a case of supply exceeding demand. On the other hand, there are a total of 66 large and small rural fairs in the county, operating 381 market-days in a month which average 6 market days for each market in a month, or 72 market days in the year. The greater the number of market days, the quicker the goods are turned over. (There is trading done on the closed-market days, but according to the data of the industrial and commercial administrative office of the Lu Qiao District, the total volume of transactions in 4 closed-market days is less than 10 percent of the volume of transactions of a single market day. This amount is included in the total volume of transactions of the rural fair trade.

It can be concluded that the turnover of money in circulation in the rural fair trade is comparatively fast. Consequently, it is inappropriate to take the simple sum of the total of social commodity retail sales and that of the transactions in the rural fair trade as a percentage of the total volume of money in circulation. Such a calculation is not precise either.

Then, how should the number of times money turns over in circulation in the rural trade be calculated?

1. Find out the number of times a man of financial means visits the fair in a year. As indicated by the data of the industrial and commercial administrative office in the Lu Qiao District, of the 100,000 inhabitants of the whole district, 60,000 have the financial means to visit the fairs. On the market day on 11 October, there were about 30,000 visitors to the fair, of whom 20,000 were people of financial means. This is to say that those who have financial means constituted one out of every three visitors to the fairs (the fairs of the district as well as the neighboring fairs). Since the rural fairs of Lu Qiao Township are extraordinarily brisk and extract great numbers of people the proportion of people in the county who visit the fairs is comparatively high. In terms of the data shown by a survey of selected sample households and that of the industrial and commercial administrative bureau of the county, it can be seen that it is closer to reality to put the figure of fair visitors at one out of every four of those with financial means in the county (the fairs of the district as well as the neighboring fairs). Since there are 72 market days per year for every market town, we divide this figure by four, for the average number who visit the fairs. This means that, on average, every person with financial means would visit a fair 18 times in a year. If we multiple the goods on sale by 18 times, we can determine the annual total value of the goods of sale for Huang Yan County.

2. Find out the ratio of actual transactions in the rural fair to the volume of goods on sale. According to data on the rural fair trade dealings of Lu Qiao District and, considering the data supplied by the industrial and commercial administrative bureau, we came to the conclusion that the actual transactions in the rural fairs are 65 percent by value of the total goods on sale.

3. Calculate the number of times money turns over in circulation in the rural fair trade dealings. Thus, 65 percent of 18 visits to the fair per person of financial means in a year would yield the figure of 11.7 visits. This figure represents the number of transactions of goods carried out annually in the rural fairs as well as the number times money is turned over in circulation.

With the data of the number of times money is turned over in circulation in the rural fairs, calculations can be made in accordance with Marx's equation of money in circulation. Accordingly, in 1979 the total transactions executed in the rural fairs trade amounted to 42 million yuan. Divided by 11.7, the number of times money is turned over in circulation in the rural fairs, this figure yields a quotient of 3.59 million yuan in cash involved in such trade at the end of 1979, representing 9.82 percent of the total volume of money in circulation in the whole county in the same period.

In order to verify the accuracy of the volume of money in circulation needed by the rural fair trade, the following is an analysis of the data of the family budget survey conducted by the People's Bank office in Huang Yan County. In 1979, in the ownship the 9 households with 39 members under survey dispursed a total of 9,262 yuan in cash, of which 3,118 yuan were spent in the rural fairs, representing 33.67 percent of the total. Of the 19 households with 91 members in the villages under survey, a total of 11,823 yuan in cash were expended, of which 3,066 yuan were spent in the rural fairs, 25.93 percent of the total. In the cash disbursements of collective entities, about 5 percent was involved in rural fair dealings. As for the mobile population, 30 percent of their expenditure was made in the rural fairs. At the end of 1979, the allocation of money (cash) in market circulation was as follows: 27.35 million yuan were held by commune members, 3.43 million yuan were held by township inhabitants, 5.66 million yuan were cash held in security belonging to collective entities, and 120,000 yuan were held by the mobile population, making a total of 36.56 million yuan. According to the different proportions of cash spent in the rural fairs through the various channels, the following calculations can be made:

Multiplying 27.35 million yuan by 25.93 percent gives 7,091,800 yuan.

Multiplying 3.43 million yuan by 33.67 percent gives 1,154,800 yuan.

Multiplying 5.66 million yuan by 5 percent gives 283,000 yuan.

Multiplying 120,000 yuan by 30 percent gives 42,000 yuan.

Total equals 8,571,600 yuan.

The total volume of money in circulation of the whole county diverted to the rural fairs, thus amounted to 8,571,600 yuan. Since money turns over 11.7 times annually in the rural fairs only five times in the county as a whole, this cash volume entering the rural fair dealings should be multiplied by 5/11.7. To put the figures into a mathematical calculation, 8.5716 multiplied by 5/11.7 equals 3.663 million yuan. This means that about 3.66 million yyan of the money in circulation of the whole county were involved in the rural fair dealings. This figure is basically in line with the figure of 3.59 million yuan yielded by the equation mentioned previously.

An Analysis Of The Development Trend Of The Rural Fair Trade

As mentioned previously in this article, for the last year or so, the rate of growth of the actual transactions executed in the rural fairs greatly exceeded the growth rate of the volume of retail sales of social commodities. In 1979, the proportion of the rural fair trade as opposed to the total retail sales of social commodities in Huang Yan County was 22.98 percent. The estimated figure for 1980 was a higher figure of 30.14 percent. Will the proportion continue to climb without limit? This is a debatable point. In a short-term analysis, considering the fact that the more lenient economic policies were adopted not long ago, a more significant development of the rural fair trade is expected . This is particularly true in the case of wholesale peddling, the proportion of which will increase. The situation of "going for commerce and discarding farming" does exist in a few localities. The development of sideline businesses in the villages as well as other diversifications will also stimulate the growth of the rural fair trade. As the enterprises run by the communes and production brigades as well as the collective neighborhood enterprises in the urban areas develop, a considerable part of their raw materials will come from the rural fair. Their products will also be sold there. As the individual economy of the townships is developing, it is also connected with the rural fairs in multifarious ways. Of course, the development varies in different places. In some places, the momentum of the rural fair trade is still in full swing. In other places, the development has been more moderate. In terms of a long-term analysis, the growth rate of the actual transactions executed in the rural fair cannot and will not constantly exceed that of the total retail sales of social commodities. There are various reasons for this. First, the major products are handled by the state. What are bought and sold in the country markets are products in excess of fulfillment of the state plans, and they are products in small quantities. Moreover, the country market trade is limited to certain specific areas, conducted only 2 out of every 10 days. It is limited in terms of products, locality and time. Second, with the gradual completion of warehouses in the system of supply and marketing cooperatives, part of the long-distance peddling trade may be displaced. Third, some of the commune and production brigades, as well as the agro-industrial-commercial enterprises are developing contracted purchases and sales through negotiation, and thus certain products on sale will decrease in volume (that part of contracted purchases and sales through negotiations taken by the communes and production brigades and those taken by the agro-industrial-commercial enterprises outside of the rural fairs is not included in the figures of actual transactions of the rural fair trade as quoted in this article). For example, in August the straw mats on sale in Lu Qiao township numbered about 2,500 pieces. With the execution of contracted purchases and sales in negotiation with the peasants conducted by the agro-industrial-commercial enterprises of the Lu Qiao District, straw mats on sale have been reduced to about 600 pieces. Fourth, with the adoption of more lenient economic policies, in some localities the peasant market trade gathers momentum suddenly and expectedly, and the administration authorities cannot distinguish between what are profiteering and speculation and what is normal peddling trade. Furthermore, at present they do not have the correct measures to enliven the market or to strengthen the necessary management. Such a situation will continue for a time, but, in time, adjustments will be made under the guidance of the national plan through the application of the law of value and through the lever of credit, taxation, prices and so on. In consequence, the growth rate of transactions executed in the rural fairs will tend to come into a more moderate development stage after a period of comparatively rapid development. With the implementation of the guideline of readjustment of the national economy and with the growth of production of the light and textile industries, it is even possible that the growth of the transactions executed in the rural fair trade may be slower than that of the retail sales of social products. Basically speaking, the proportion of the rural fair trade to the total retail sales of social products will tend to be stable, while the absolute volume in terms of money will keep on growing.

IMPORTED MATERIALS USED TO EXPAND FOREIGN EXCHANGE REVENUE

Guangzhou GUANGZHOU RIBAO in Chinese 15 Aug 81 p 2

[Article by Lao Xu [0525 6079]: "Using Imports To Support Exports, Make Trade Active, the City's Foreign Trade System Develops Importing Raw Materials for Processing and Realizes Results"]

[Text] The various companies of the city's foreign trade bureau received raw materials from foreign firms for processing and at the same time launched operations to "process imported materials" to create more foreign exchange for the state.

"Processing imported materials" is a versatile method of trade using imports to support exports. Foreign trade companies import raw materials or spare parts from foreign nations, process them and then export them or help to produce other products for export. This method creates more foreign exchange than simply charging for processing fees for "processing incoming materials."

This bureau and its subsidiary companies have for over a year launched "importation of raw materials for processing." They have already imported over 100 tons of steel materials, over 100 tons of nonferrous metals, over 600 tons of plastics, scrap paper, wood, chemical raw materials and such materials, and forcefully eased the difficulty of a shortage of incoming raw materials. The "triangle" brand kerosene stove has been poolar in the international market during recent years. The industrial departments also have productive ability but there is a shortage of raw materials. The city's light industrial exports company imported raw materials to support the development of this commercial product. Last year, 1.5 million stoves were processed and produced. During the first half of this year, the exports of kerosene stoves increased over onefold over the same period last year. Guangzhou's flash lights are a popular item in the international market, but there is a relative shortage of raw materials needed for their production. This company also imported raw materials to support production and tried to satisfy the production needs as much as possible. Last year, over 2.7 million dozen flash lights were exported. During the first half of this year, exports of flash lights increased again. In addition, this bureau's related departments also imported a group of electroplating materials, plastics dyes, fragrant oils and essence of fragrances and such auxiliary materials according to the needs in production to improve the quality of hardware products, plastics products and foodstuffs and to improve the competitive ability of these commercial products in the international market.

In launching "importing raw materials for processing," this bureau and its subsidiary companies paid attention to helping the development of advanced domestic technology. The bureau used over $300,000 to import a batch of advanced foreign electronic and electrical parts to assemble 15,000 television sets, 15,000 tape recorders, 10,000 electronic calculators, 35,000 watches, 600,000 casette tapes for tape recorders, and some household electrical applainces and other commercial products and they were sold in markets and shops to earn foreign exchange. They created for the state a total of over $2.5 million. Since the beginning of this year, they also imported parts to assemble a batch of television sets, tape recorders and watches. In the first quarter, they expanded the revenue from foreign exchange by 1.27 million yuan, an increase of 2.3 times over the same period last year.

LABOR AND WAGES

LIVING STANDARD IN JAINGSU RURAL AREAS RISING

Nanjing XINHUA RIBAO in Chinese 28 Sep 81 p 1

[Article: "Commune Members' Sideline Income Increases, Market for High and Medium Quality Commodities Expands"]

[Text] The provincial statistical office has announced the results of an economic survey of 1,000 rural commune member households in the province's 22 counties: in the first half of this year, commune member household sideline industries continued to develop, cash income increased, the standard of living improved steadily, and the market for high ahd medium quality commodities in the countryside expanded.

These 1,000 households had an average per capita foodstuff output from self-managed plots (private plots and feed plots) of 36,6 jin, equivalent to 1 month's food supply; the increase in output of oil-bearing crops was even more marked, reaching a per capita figure of 6.3 jin, which exceeds last year's provincewide figure of 4.4 jin. In the first half of the year the households sold an average of 46.5 jin of foodstuffs from self-managed land, sold or slaughtered an average of one fattened pig, and sold an average of 12.6 jin of eggs, resulting in an increase of 90 percent over last year's figure for products marketed. On average the per capita income was 79.2 yuan, of which 51.3 percent was from sale of agricultural sideline products.

In the first half of this year, these 1,000 households had an average per capita cash expenditure of 90.4 yuan; the proportion spent for the purpose of foodstuffs and daily-use articles (including the "four major items" and major household furniture) was equivalent to more than 60 percent of last year's total cash expenditures.

On the average, there were 2.8 bicycle purchases, 2.5 sewing machine purchases, 6 radio purchases, and 8.4 clock and watch purchases (including 7.4 wristwatches) per hundred households in this thousand-household sample.

The statistics given above indicate that the standard of living of the broad mass of agricultural commune members in our province is steadily rising and that demand for high and medium quality products is steadily increasing. The relevant departments must make a major effort to increase their production of consumer products in order to satisfy the growing needs of the countryside.

GENERAL

HOW TO IMPLEMENT MANAGEMENT RESPONSIBILITY SYSTEM DISCUSSED

Nanjing XINHUA RIBAO in Chinese 28 Aug 81 p 2

[Article by Cui Peidu [1508 0160 4048] and Hong Tao [3161 3325]: "Internal and External Responsibility of Enterprises Practicing the Economic Responsibility System Must Be Matched"]

[Text] During the course of implementing the economic responsibility system, the two links of the external economic relationship of the enterprise and the internal relationship of distribution within the enterprise must be handled well. One of the prerequisites to implement the economic responsibility system is that the state gives contracts for work to the enterprise, the profession and even to the locality in order to solve the problems of overly tight control and "eating from the big pot" and to handle the external economic relationships of the enterprise well. Combining the responsibility systems at each level and the principle of distribution according to work to overcome equalitarianism and to handle well the internal relationship of distribution of the enterprise are important foundations for implementing the economic responsibility system. The two links are mutually supplementary and act upon each other. Only by matching these two links and simultaneously grasping them well can the economic responsibility system be implemented on an overall basis so that the duties and responsibilities of each sector are clear and the correct combination of the economic benefits of the state, the enterprise and the individual worker can be realized.

How can these two links be matched well? The key is to emphasize the word "responsibility." Each level must be responsible to the end. The good or poor performance in production by the industry and the enterprise and the business profit or loss must depend upon the efforts of the enterprise itself, on the one hand--this is of course the main aspect--but on the other hand, they are limited and affected by many factors outside the enterprise; for example, the planned index (including yield, quality, profit, cost and such major indexes), whether they suit the actual situation, whether raw materials, fuel and power are supplied in time according to plan, whether the marketing channels for the products are open, whether the price and the tax rate are reasonable, whether the necessary capital and labor can be obtained, whether there are definite autonomy and limitations in business management, etc. These must all be determined with the active support and the rational solution of some economic management departments outside the enterprise, and overly tight control and "eating from the big pot" will surely affect and confine the enthusiasm of the enterprise. Therefore, to carry out the economic responsibility system in industrial production well, the word "responsibility" must be emphasized both within and outside the enterprise. If responsibility is assured within but not outside the enterprise, if the lower echelons are responsible but the higher authorities are irresponsible, thus carrying out a "half-responsibility system," then it is certain that responsibility will not be carried out well and assurances (assurances of income) will not be solid. The situation will still be one of "providing the big meal" by the higher authorities and "eating from the big pot" by the lower echelons. Comrades of Suzhou city directed their attention to this situation and asked that these two links be unified under the word "responsibility;" it implemented the level-by-level responsibility system of "the three outer levels" and the "three lower levels." The "three outer levels" refers primarily to profits and means that the state (province) contracts to the city, the city contracts to the bureau (company), and the bureau (company) contracts to the enterprise; the "three inner levels" refers primarily to quotas and means the enterprise contracts to the workshop, the workshop contracts to the shift, and the shift contracts to the individual. We believe that this level-by-level responsibility system is indeed a good method. Only in this way can the economic responsibility system be truly implemented.

Then how is level-by-level responsibility carried out? The forms of being responsible for work are not fixed or uniform because they must be suited to the circumstances of the place, the time, the profession, the enterprise and the type of job. External responsibility of the enterprise: this can be carried out by regional responsibility--the city and the locality can be responsible to the province. A county can be selected as the region to implement on a trial basis the method practiced by Qingyuan County in Guangdong. This can also be professional responsibility (bureau, company), such as keeping a percentage of the profits and proportionally dividing the profits of the profession and the profits of the enterprise (company) with enlarged authority. This can be responsibility for the loss of a losing enterprise (profession): losses beyond set allowances are not subsidized, the amount of loss not realized is left for use by the responsible unit. It can be responsibility for profits of an enterprise making slight profits, keeping a proportion of the surplus harvest and keeping more of the amount deducted from withdrawals. It can be a conversion of the profits of a small state-operated enterprise into taxes according to the method of the collective enterprise. It can also be "double reduction by half" and yearend bonuses from surplus profits of a collective enterprise, etc. Distribution within the enterprise: this can be wages for piecework or wages for piecework over the quota. It can be floating wages with rewards for piecework. It can be rewards for surplus yields (including rewards for piecework beyond the fixed quota). It can be rewards of work points. It can also imitate the linking of planned output with remuneration practiced in the farm village to contract production to the shop, shift and the individual.

At present, in the course of implementing the economic responsibility system in industrial production, regardless of which form of responsibility is used and regardless of whether it concerns the external economic relationships of the enterprise or the internal relationship of distribution of the enterprise, consideration must be given to the complexity of this work, the broad scope and the strong policy nature. We must investigate profoundly to understand the root cause and analyze the situation on an overall basis and seek truth from facts. We must pay attention to one tendency covering another tendency, and we must prevent this or that kind of onesidedness. For example, the responsibility indexes for a profession and an enterprise must be set so that they can be achieved by insisting on the exercising of effort, and we must also make sure that the profession and the enterprise will be able to surpass in yield and realize benefits. Similarly, the quotas set internally by the enterprise must be maintained at an advanced level: they must not be too low, thus providing wages for labor not performed as surplus labor, and we must also emphasize that they should be reasonable, they cannot be too high, thus making it impossible for most of the workers to achieve the goals and discouraging their enthusiasm. The method of responsibility for work must fully manifest the combination of authority, responsibility and profits so that the enterprise exercises the authority and reaps the benefits. At the same time, we must concretely strengthen national supervision, prevent and oppose the tendency of departmental selfishness and illegal behavior of some enterprises that make false reports, converting large public benefits to small public benefits, "bilking the nation to fatten oneself" so that we can assure that the nation will have increased income. While handling the relationship of internal distribution of the enterprise, we must pay attention to unified planning with due concern for all aspects, solve the "five relationships" between new and old workers, operators and assistants, workers and scientific personnel, workers and leading cadres, shops and shops. We must mobilize the enthusiasm of each sector, we must insist on distribution of work according to the quantity and quality of labor, and we must not distribute work grossly unevenly because we are afraid. We must not limit "leaders" that have emerged. We must reward surplus labor. It would be best if we could give rewards like they are given in farm villages, "without upper or lower limits;" more surplus work should be given more reward and less surplus work should be given less reward, and no reward should be given when there is no surplus labor. Those units that cannot complete the quotas should be punished, and reward and punishment should be clearly separated. Otherwise, if we use a "cover" to cover everything, if we do not give more reward to more surplus labor or yield, and if we do not give rewards for small surpluses, then, even if there are differences, even if the differences are small, we can only "use small equalitarianism to oppose large equalitarianism," and in the end we will still be unable to overturn equalitarianism. In the entire work of implementing the economic responsibility system, we must pay attention to using economic methods to implement the responsibility system and mobilize enthusiasm. We must also rely on strong and forceful ideological and political work, actively carry out well the ideological building of the group of leaders of the enterprise and the worker team, and guide the work of popularizing the economic responsibility system to develop in a healthy direction. We must enliven microeconomics through the responsibility system, and we must not neglect strengthening the guiding and planning of macroeconomics and strengthening the supervision of enterprises by the state. Generally speaking, when we do anything, we cannot take care of one thing and neglect the other, grasping this side but losing the other side. And to make the responsibility system effective, we should increasingly operate in this way.

IMPROVEMENT OF COMMODITY CIRCULATION PRACTICES URGED

Kunming YUNNAN RIBAO in Chinese 20 Sep 81 p 1

[Article: "Resolutely Correct Unhealthy Tendencies in Commodity Circulation"]

[Text] Recently, in keeping with the spirit of relevant directives by the State Council, this province's People's Government issued a document entitled "Several Regulations on Resolutely Checking Unhealthy Tendencies in Commodity Circulation" and requested that the various localities and departments implement it conscientiously.

This document cited certain problems in commodity circulation in this province and then pointed out that unhealthy tendencies in commodity circulation seriously corrupt social values, interfere with the normal progress of regulation and reform of the national economy, disrupt smooth implementation of the state plan, and hinder normal functioning of the markets. Accordingly, the document stipulates the following:

1. Materials and commodities under state control (including production materials and means of livelihood) shall all be managed by the cognizant departments, and no other department or unit may manage or engage in commodities activity without permission. It is forbidden to use goods for which there is intense demand to establish relationships, expedite transactions "by the back door" or engage in illegal collaboration. It is forbidden to raise prices, negotiate prices or institute "middleman's prices" between two organizations.

2. The "Notice on Saving Nonproduction Expenditures and Opposing Waste" issued by the Central Committee and the State Council is reaffirmed. All departments and units are forbidden to use public funds to entertain or give gifts; enterprises and institutions and economic organizations are forbidden to adopt pretexts for issuing money to buying and selling personnel to establish relationships. It is forbidden to entertain under the guise of inspecting work, inspecting production, or holding on-the-spot meetings, cooperative meetings or exchange meetings. It is forbidden to demand property from another unit under the guise of "cooperation." It is forbidden to demand or accept such improper additional payments as "sales commissions," "service charges," or gratuities. Those who entertain or give gifts with public funds shall not be reimbursed for their expenses; the costs shall be borne by the instigator of the action. Those who

violate state policy provisions by demanding or receiving various types of payments shall be treated as having engaged in bribery or corruption.

3. Finance bodies, banks and financial departments at all levels must remain on guard and strengthen their economic oversight in transfer of accounts, closing of accounts, collection and reimbursement. Those who act in an unprincipled manner, give out false information, act by tacit agreement with ringleaders, use official position to initiate unauthorized relationships, or act contrary to the financial and economic system, shall be dismissed.

4. No commodity management department or unit may divert commodities to itself at low prices or at artificially cut prices; products whose prices really need to be lowered and for which permission to lower prices has been secured must in all cases be put on the open market for sale. Those who disobey this provision shall be required to make up the difference in accordance with the retail price and shall, depending on the gravity of the offense, be dealt with as accomplices or ringleaders.

5. It is strictly forbidden for any department, unit or individual to engage in speculation or profiteering with state materials and commodities which are in short supply, including illegal buying or selling of supply quotas, certificates, receipts, or contracts or renting or lending of bank accounts, checks. cash and the like. All violators shall be treated as speculators and profiteers.

6. Leadership cadres at all levels must set a personal example and are strictly forbidden to provide or receive entertainment or to take bribes, to give improper instructions or to harbor or tolerate breaches of discipline; they must actively support the masses and the auditing personnel in exposing and resisting all unhealthy practices, and must deal strictly with cases of infringement; they are forbidden to use any pretext to hinder investigations or to attempt retaliation. Those who are guilty of such offenses shall be subject to the strictures of the law and shall be dealt with harshly.

The document also requests that all localities and departments conduct a conscientious inspection of how well policy and the system are being implemented and take effective and resolute measures to put a stop to this unhealthy tendency. In addition, all relevant departments must join together to do this work effectively.

ALL-OUT EFFORT IN FOURTH QUARTER CALLED FOR

Jinan DAZHONG RIBAO in Chinese 30 Sep 81 p 1

[Article: "Prepare for an All-Out Effort in the Fourth Quarter; Promote the Economic Responsibility System"]

[Text] A provincewide industry and communications work conference was recently held in the capital of [Shandong] province. It was attended by persons responsible for industry and communications work in all the prefectures and cities, and by economic committee chairman, heads of finance offices, and responsible persons from industry and communications offices and bureaus directly subordinate to the province and in the cognizant departments. At the conference, the relevant directives of the Central Committee leadership and the spirit of the national industry and communications work conference were communicated to the participants and studied; particular discussion and study were devoted to good industrial production work in the fourth quarter of this year and good preparations for next year's production, continued promotion and improvement of the economic responsibility system, further effective enterprise reorganization, and effective technical transformation of existing enterprises. Deputy province chief Comrade Liu Peng [0491 7720] gave the report, and province party committee secretary Comrade Qiang Xiaochu [1730 2556 0443] made the closing speech.

At the meeting, the status of industrial and communications production work in the first 8 months of the year was analyzed, and industrial production during the fourth quarter of this year and industrial production tasks for next year were studied. All prefectures, cities, departments and enterprises were requested to mobilize vigorously for a major effort in the fourth quarter, to do everything possible to guarantee fulfillment of this year's state plan and to strive to increase output and profits. In addition they were requested to make active preparations for next year's production. The following measures for effective performance of this year's and next year's industrial production were studied: First, continued energetic development of daily-use consumer items, with a focus on products of the textile and foodstuffs industries and on ten types of household machines, and with emphasis on production in collectively-owned enterprises and commune and brigade enterprises. Second, ways must be found to stabilize heavy industry and make it gain ground; the key is good work in coal production and machinery production. Third, all industries and sectors must give top priority to increasing the number of varieties and improving quality, and must improve the competitiveness of their products. Fourth, an earnest effort must be made in the conservation of raw and other materials and fuels, and particularly in the conservation of energy, and conservation must be used to achieve increased output. Fifth, management and administration must be strengthened, economic accounting must be made stricter, and economic results must be improved.

Special study was made of the continued implementation and improvement economic responsibility system. It was pointed out that within the economic responsibility system the interests of state, enterprise and employees alike must be handled correctly, and with the precondition of large revenues for the state, the enterprises should get to retain more money and the employees to earn more money. Increased employee earnings should be accompanied by increased profits and higher labor productivity. In developing the economic responsibility system attention must also be given to the following points: first, situations in which high-profit enterprises make a major effort and low-profit enterprises do not and in which production is divorced from social needs must be prevented; second, we must assure product quality, oppose crude, slipshod manufacture, and intensity oversight; third, in the matter of increasing employee earnings, account must be taken of the surrounding circumstances; the enterprises' cost per unit output and contribution of wages to unit cost should be declining, not increasing; fourth, the internal impetus created in an enterprise by the economic responsibility system should be directed toward enterprise reorganization and improvement of the quality of administration and management. Next year's performance contract objectives for the province's industrial and communications system were studied at the meeting. In principle this year's performance contract base figures should be used for next year, adopting them to increased output. In the case of enterprises with increasing profits, this year's performance contract base figures may be progressively increased by a certain percentage, and the percentage of profit retained may also be suitably adjusted; in the case of enterprises whose output will change considerably next year, adjustments can be made in accordance with individual circumstances. Next year's performance contract system should, as far as possible, involve performance contracts for each level in each of the industries in question so that the enterprises' cognizant departments will also have a certain degree of economic responsibility.

Technical renovation of existing enterprises was also studied at the conference. The focus in technical renovation should be placed on modernizing equipment, modernizing processes, product replacement, improvement of quality, more varieties, energy conservation and comprehensive utilization of resources in order to achieve better economic results.

Conference participants requested that leadership cadres at all levels on the industry and communications front conscientiously study and implement the spirit of the conference on problems of the ideological front held by the Central Committee and stir up enthusiasm, improve work style, overcome slackness and lack of focus, and intensify ideological and political work. Leadership cadres of the industrial and communications departments must visit the lower levels, conduct their business on-site, and go to the basic levels to solve problems. Various industrial and communications offices and bureaus must follow the lead of the main leadership cadres and organize cadres in these bodies to get down into the plants, take part in the productive labor, put the situation in order in a group of key enterprises and get industrial and communications production moving forward.

EXPANDED HOUSEHOLD SIDELINE PRODUCTION ADVOCATED

Nanjing XINHUA RIBAO in Chinese 30 Sep 81 p 1

[Editorial: "Develop Household Sideline Production, Made the Rural Economy Prosper"]

[Text] While we make a major effort in grain production, the energetic development of economic diversification is of great importance for rational utilization and development of various resources, vigorous development of commodity production and maintaining smooth forward progress in our country's modernized agricultural construction. Currently, while vigorously developing a diversified collective economy, we must devote attention to actively promoting and supporting such household sideline enterprises, carried on by individual commune members or as joint operations, as breeding [of aquatic products], cultivation, handicrafts, transport and services.

Commune members' household sideline industries are a necessary complement to the socialist economy. Supporting these sideline industries is an important part of promoting economic prosperity in the countryside. The development of commune members' household sideline industries does not require large investments by the state or the collective, results are achieved quickly, and they are capable of promoting rapid development of the commodity economy. We should not underestimate these activities: if each household raises a few pigs or goats or a flock of chickens, ducks or geese, keeps a few rabbits or a few beehives, plants some melons, fruit or vegetables, plants a few trees or a few dozen trees near the house, or does some weaving, fishing and the like, the cumulative results for 1,000 or 10,000 households will be considerable. Last year, of the 400,000 fattened pigs that were sold in Nanjing city and suburbs, 351,000 or 88 percent had been raised by commune households. Poultry and eggs are supplied almost entirely by household sideline activity. Developing such sidelines is also an important way to bringing quick prosperity to the peasants. The per capita income of commune members in Suzhou prefecture last year was 133 yuan, of which 68.2 yuan or 29 percent was from sideline activities. Some communes, brigades and individual commune members relied primarily on sideline activities for their cash income. In particular, the best way for some impoverished households with limited manpower and heavy burdens to alleviate their difficulties and move toward prosperity is development of sideline activities. Developing sideline activities can bring unused manpower thoroughly into play and assure full, rational utilization of dispersed resources. Some workers with limited strength find it difficult to participate in collective labor but can make a considerable success of a household sideline. Moreover it should be noted that after the responsibility system is instituted throughout agricultural production and labor productivity is increased, surplus manpower and available spare time increase, and accordingly we may foresee that as modernized methods of production are adopted and labor productivity is further increased, there will be more surplus labor available. Active encouragement and support of commune members' household sideline activities will provide a means of utilizing large amounts of surplus manpower over and above that which the collective places in its own industrial and sideline activities, so that the collective and the individual will complement each other and work for the development and prosperity of the socialist agricultural economy and the development of modernized agriculture. The economic results of commune members' household sideline activities are generally rather good because the sideline activities are capable of leading to thorough, rational utilization of dispersed resources, thus promoting and supporting the collective economy. If thousands and thousands of households are mobilized, all manner of special personal skills are brought into play and all varieties of resources are rationally employed in developing household sideline activities, this will actually constitute a complete liberation of the rural labor force, of natural resources and of productive forces, and will play an important complementary role in making the socialist economy prosper.

This province is densely populated with medium and small size towns and cities, communications is rather well developed, agricultural labor is plentiful, there is an abundance of mechanical skills and extensive usable natural resources, and not only do there exist many traditional household sidelines, but many new activities have been developed, with the result that the province has many favorable conditions and much potential for developing sideline activities. In recent years, relaxation of rural economic policy has resulted in a considerable increase in commune members' household sideline activities in this province. The percentage of commune members' net annual incomes produced by these activities has been steadily increasing, reaching 26.7 percent in 1980; but the 1963 level is still far from being equalled. The provincial party committee and government request that all localities conduct overall planning for diversified collective economies and commune members' household sideline activities so as to bring about division of labor and cooperation, and that they strive to make commune members' net income from household sidelines increase considerably in the next 2 years. This is also a pressing requirement for the broad mass of cadres who are commune members, and we must strive to achieve it as quickly as possible.

The key to developing commune members' household sidelines is implementation of the party's relevant policies and the use of policy to enlist commune members' enthusiasm. After commune members complete their collective production tasks, provided that they do not rent their land, hire and exploit labor, practice speculation and profiteering, or do harm to natural resources, they may engage in any form of sideline activity, and all projects which the collective cannot run but can suitably be assigned to individuals to run should be turned over to individual operation as soon as possible. Not only should the enterprises refrain from arbitrary imposition of limitations and interference, but they must provide financial, seed supply, technical and marketing support, and in particular must redouble their concern for and active assistance of commune members in difficulties. In developing their household sidelines, because technical levels and labor inputs differ, the commune members will inevitably and naturally obtain different levels of profit. The fact that some commune members' profits stand out a bit above the rest should not immediately lead to the conclusion that there is a capitalist polarization, and to restrictions or attacks on commune members' household sidelines. Production teams with excess manpower can offer some commune members with skills the option of taking part in communal productive labor or specializing in [aquatic products] breeding, handicrafts or other family sidelines, while retaining their support from the collective. But some key households or specialized-trade households must have certain obligations to the collective to provide accumulation or fertilizer or to complete a state sales assignment or the collective's capital construction assignment.

As commune members' household sidelines develop and the number of agricultural sideline products increases, it will be insufficient to rely only on the state-run commercial channels for circulation, and accordingly effective work must be done to promote the country fair trade and to restore and develop the positive effect of rural market towns and distribution centers for agricultural sideline products. Agricultural sideline products from the commune members' sideline activities, other than those which cannot be marketed according to state standards, may be sold at will once state sales assignments are completed. Industrial and commercial administrative departments must protect the commune members' legal activities, including facilitating commodity circulation, and must promote the development of the commune members' sideline activities. Commercial and supply and marketing departments must strictly observe state procurement policy and price policy, and may not arbitrarily lower the grades or prices of products and thus cause loss to the peasants. They must also strive to improve their operating methods, increase their service orientation and do everything possible to make things easy for the peasants. Comrades in the various industries and in particular cadres at all levels must bear firmly in mind the Central Committee's and State Council's statement in their circular on the problems of expanding the rural economic diversity: "If we do not first address and effectively solve the problem of providing basic necessities for the 800 million peasants and of bringing them prosperity, but instead think only of buying more of the various agricultural sideline products needed by the cities while forgetting to make an all-out effort to help the peasants produce more of these products, so that we are buying up the eggs, killing off the chickens and fishing out the ponds, then progress in the overall cause of modernization will be out of the question."

CRITICISM OF LIBERALIZATION SEEN AS NECESSARY TO ECONOMIC CONSTRUCTION

Nanjing XINHUA RIBAO in Chinese 30 Sep 81 p 3

[Article by Lu Yiming [4151 5030 2494]: "Will Criticism of Liberalization Tendencies Hinder Economic Construction?"]

[Text] For some time there has been a trend toward bourgeois liberalization on the ideological front. We naturally must use rigorous criticism and the necessary amount of struggle to overcome this erroneous tendency. But some comrades believe that we should currently be concentrating our efforts on improving the economy and that opposing bourgeois liberalization may dissipate the leadership's and the masses' strength and hinder economic construction, so that it amounts to "dropping a watermelon while grasping for a sesame seed." This question needs to be clarified.

It is true that we should concentrate our efforts on improving the national economy. This is the party's firm and unalterable policy. Back at the Third Plenary Session, the Central Committee unequivocally made the great strategic policy decision to shift the work of the entire party to the development of socialist modernization. The "Resolution on Certain Historical Questions Since the Foundation of the State" which was passed by the Sixth Plenary Session also drew the historical conclusion that with the socialist transformation essentially complete, the main contradictions which we must resolve are contradictions between the people's growing material and cultural needs and backward social production. Historical experience teaches us that the essence of our past errors was that under the guidance of "left" ideology we failed to carry out unswervingly the party's strategic shift in the focus of its work, and instead, during the Cultural Revolution, we actually came forward with the erroneous "theory of productive forces only," which was fundamentally at variance with historical materialism, with the result that the national economy was gravely harmed. This was a bitter lesson. In the future, we must adhere firmly to the central concern of economic construction, and unless there is a large-scale invasion by an external enemy, we must not again depart from this central concern. This in incontrovertible.

But this does not mean that we can be indifferent to problems in the ideological sphere and trends toward bourgeois liberalization. According to the Marxist viewpoint, the economic base and the superstructure, material production and spiritual construction are interconnected and interrelated and cannot be separated from each other. On the one hand, we should admit the decisive effect of matter on spirit and of the economic base on the superstructure. But on the other hand, we must also perceive the reaction of spirit upon matter and of the superstructure on the economic base. To proceed with our socialist economic construction, it is of course important that we act on the basis of objective economic laws, but likewise we must not neglect to do effective work regarding the state of consciousness or to strengthen spiritual and cultural construction. Advanced theories and healthy culture and art, in keeping with the socialist economic base, which lead the people in their vigorous upsurge, serve as a great impetus toward economic construction. Conversely, erroneous ideas and theories and unhealthy art and culture hinder economic development. The reason that we engage in criticism of bourgeois liberalization on the ideological front is to make our superstructure, and especially the state of consciousness, accord better with the economic base, so as to assure that socialist economic construction can proceed smoothly.

We must clearly recognize the harm which bourgeois liberalization brings to the development of the four modernizations. In order to carry out economic construction we must have a firm and correct political orientation, and all of the people must concentrate their minds on it, devote their whole strength to it, and bring boundless confidence to it. But the erroneous tendency toward bourgeois liberalization, embodied in certain people's articles, speeches and literary productions, denigrates our socialist fatherland, depicts the socialist system as devoid of any merit, disseminates doubt and negative attitudes, disperses the people's spirit of struggle and shakes people's confidence, in the hope of enticing people away from the socialist path. But if we leave the socialist orientation, our economic work will undoubtedly take an incorrect path, and there will be no question of socialist modernization. Implementation of the four modernizations requires that the entire party and the entire people unit solidly around the party Central Committee and unanimously engage in arduous struggle. But bourgeois liberalization would lead people away from party leadership and would have the party "rule without intervention"; it even slanders and ridicules the image of the party. If we were to depart from party leadership and separate ourselves from the party, the nucleus which leads our cause, our country would inevitably disintegrate; without a unified ideology and without a unified purpose, how could there be any question of normal economic construction?

Accordingly, criticizing bourgeois liberalization is not a small matter, some "sesame seed" that one can reach for or not reach for, but rather is a major matter which has an effect on whether we can adhere to the four basic principles and to our socialist prospects. While strengthening leadership over economic work, our leaders at all levels must also strengthen their leadership on the ideological front, overcome the current state of weakness and lack of focus, bestir themselves and boldly seize the weapon of criticism in order to struggle against erroneous tendencies such as bourgeois liberalization. Although this requires that we expend a certain amount of effort and do some thorough and painstaking work, it is worthwhile and must not be underestimated; for it can only benefit the cause of economic construction, it cannot hinder it.

ELIMINATION OF 'WELFARE PRODUCTS' PRACTICE ORDERED

Shanghai WENHUI BAO in Chinese 3 Oct 81 p 1

[Article: "Stop the Unhealthy Tendency of 'Welfare Products'"]

[Text] The "Circular on Some Units' Indulgence in 'Welfare Products,' Which Harms the National Interest," recently published by the municipal party committee and People's Government, requested that all systems and units make a factual, conscientious inspection and resolutely correct the unhealthy tendency of "welfare products," assimilate the lessons of this experience and prevent recurrence of the practice.

For some time, responsible persons of some enterprises and service units have used "concern for employee welfare" as an excuse for producing "welfare products," involving a shocking number of varieties and range and number of products and creating a serious situation. This is a phenomenon which is detrimental to state and collective interests, substitutes private interests for public ones, and is an unhealthy tendency in the economic sphere. The Central Commitee, the State Council, the municipal party committee and the municipal People's Government have repeatedly warned that the "Guiding Principles" must be implemented, that strict financial and economic discipline must be instituted, but responsible party and government cadres in some of our departments and units act as though they had heard nothing and were unaware of this harmful and noxious tendency; some of them even connive at and protect such practices and profit by them. Party organizations and administrative leadership departments at all levels must deal severaly with this problem and must conscientiously implement the spirit of the Sixth Plenary Session and of the conference on problems on the ideological front, must conscientiously improve the leadership's lax and unfocused attitude, must stimulate new vigor, join with the employees to wage an arduous struggle, and make a contribution to the development of the four modernizations.

The circular requests that all systems and units designate discipline committees, trade unions and finance organizations to examine into and deal with instances of "welfare products" occurring since 1980. Organization leaders who knowingly did wrong, did not heed warnings to cease, pretended to comply while engaging in wrongdoing, and engaged in deception, must be dealt with by party and government disciplinary proceedings, and those who have committed criminal offenses must be turned over to the courts for legal action. If cadres in leadership organizations or principal party or government leadership cadres in enterprises or services are found to be involved, they must all be required to make restitution in accordance with the principle of "no gaining of unfair profit in economic matters"; and investigations must be made among the masses and responsibility taken. Any future occurrence of "welfare products" activities will result in ascertainment of the responsibility of the relevant leadership personnel.

GUIDING PRINCIPLES OF SIGNING A FOREIGN CONTRACT REVIEWED

Guangzhou YANGCHENG WANBAO in Chinese 19 Aug 81 p 2

[Article by Zhang Jielin [1728 2638 2651]: "Several Principles Must Be Grasped Well in Signing Foreign Economic Contracts"]

[Text] As our province gradually implements "special policies and versatile measures," signing economic contracts with foreign businesses will necessarily increase day by day. In external economic activity, whether it is joint ventures and management, cooperative production or importation of raw materials for processing, or compensatory trade, the first problem encountered is to negotiate and to sign economic contracts with foreign firms.

At present some problems worth noting, exist in the signing of foreign economic contracts, because we do not have a foreign economic contract law. For example, some contracts are not signed by the responsible persons of the enterprises themselves (legal person) but by responsible persons of the higher level administrative agencies and handed down to the enterprises within their jurisdiction for execution. This has caused economic loss, but afterwards, the higher level administrative agencies who participated in the signing have refused to shoulder any responsibility. Whether the foreign firm has a legal status was not investigated and the legal representative who came to sign the contract was accepted without having him show papers of power of attorney; contracts were signed and a situation where the contracts could not be executed was created. Some contracts had a simple content, the articles were general. For example, some contracts for processing raw materials contained only 200 to 300 words, and the contracts did not specify or did not clearly state the time, place, quantity, varieties, specifications, quality, inspection and acceptance, packaging, transportation, insurance, foreign exchange of incoming raw materials and the delivery of merchandise. Some contracts were even contradictory and written expressions were not accurate. Some contracts did not stipulate economic responsibility, and economic loss caused by violation of the contract could not be pursued. Some contracts that stipulated compensation for loss did not provide property assurances, and compensation could not be sought for loss. For example, delay in the supply of raw materials causing factories to shut down operations, delay in the payment of work or delay in work schedule for several months have caused a loss on our side but we were unable to seek compensation. Some contracts contained unfair and improper stipulations regarding rights and duties. For example, some contracts require party A to provide letters of credit to party B but they do not require party B to provide letters of credit to party A. Some contracts require party A to pay for the floating interest payments on loans taken out by party B, while party B is not required to be responsible for loan interest of party A, etc. The main reason for the emergence of such problems is that the fundamental principles in signing economic contracts that must be grasped were not understood clearly.

What are the fundamental principles that must be grasped in signing foreign economic contracts?

First, both parties involved in the signing of the contracts must possess legal status, they must have the authority and the capability to sign and to execute the economic contracts. Our representative must be a legal person. A so-called legal person is necessarily a legal organization recognized by the state and must be an organization which possesses the ability independently to manage property, independently to shoulder the duties related to civilian property and to participate in civil disputes. A foreign firm, besides being a legal entity, can be an individual. If he is an individual, we must understand whether he has any powers of execution. If the foreign firm is a legal corporation, we should understand whether it possesses the ability independently to shoulder all economic responsibilities and the ability of compensation. The contracts signed by an interested party who does not possess legal status and who cannot shoulder economic responsibility will not be assured of execution and the responsibility cannot be fulfilled to the other party, and thus the contracts themselves lose meaning. Such parties cannot participate in the signing of contracts.

Second, the signed contract must coincide with related legal requirements of our nation. If a contract contains stipulations contrary to our nation's laws, violates related regulations of our nation's laws and policies, it is not allowable, and the signed contract is void under the law.

Third, signing contracts must follow the principle of fairness, voluntariness and negotiation. This is because a contract is an instrument stipulating the "union" and the "agreement" of both parties. Therefore, the parties of the contract are equal under the law. The content of the contract must be discussed in detail, and an agreement is finally reached after full negotiation. Only such a contract can reflect the common benefits of the parties involved. A contract is legal only when it is signed on the basis of equality and voluntary negotiation. All forms of contracts which are monopolistic or fraudulent are not allowed.

Fourth, signing contracts must follow the principle of price equality and compensation. Legally speaking, this means the rights obtained and the duties borne by the parties to the contract must be reciprocal. No party should enjoy rights but have no duties and no party should have duties but not enjoy rights. For example, contracts for processing imported raw materials should not simply state the time of delivery, the place, quality and the economic compensation in case of contract violations and not state the time of delivery of the raw materials, the location, the specifications and quality of the raw materials and the economic compensation in case of contract violations. At the same time, conditions for seeking compensation of loss due to the failure of executing the contract by the other party should also be reciprocal.

Fifth, the fundamental content and the legal procedures for signing a contract must be complete. The content of the contract must be of a common nature, and specific content according to the different forms of the contract must also be clearly stipulated. For example, a compensatory trade agreement should clearly state the name, quantity, quality, specifications and model numbers, quality and performance, degree of newness, how advanced the equipment is, accessories of the equipment, price conditions, delivery dates, location and means of transport, packaging requirements, documentation, inspection, method of repayment, payment conditions, and transfer of property rights of introduced equipment. Reporting procedures must be carried out according to regulations, such as requirements for reporting to higher agencies for inspection and approval or for notarization, for reporting to industrial and commercial agencies, customs and closing account banks. Contracts will be honored by law and be legally binding only when all necessary procedures have been completed.

Sixth, the principle of economic responsibility must be implemented. The contract must stipulate clearly the responsibilities of both parties and the method of compensation for loss and for the seeking of compensation. It must also have specific stipulations of assurance. Fines or compensation for failure by either party to completely carry out the contract must be handled according to contract stipulations. Revision and nullification of contracts must be done according to procedures stipulated by law. Neither party has the right unilaterally to cancel or change contracts. If one party needs to revise or terminate the execution of a contract, such action must be negotiated and agreed upon by both parties, and it must be reported to concerned authorities and approved. If one party fails to execute the contract and causes the other party to suffer a loss, that party must bear the economic responsibility for the loss of the other party.

Foreign economic contracts are written agreements between our nation's companies, enterprises or other economic organs and foreign or Hong Kong and Macao companies, enterprises and other economic organs to develop economic exchange and strengthen technological exchange as signed according to law to establish civilian rights and duties. They are legal actions that express the uniform intention of both parties. Legally drawn contracts are protected by law, they are binding on both parties of the contract. Contracts cannot be altered without following the law or without the agreement between the two parties to the contracts. Therefore, when we sign contracts, we must first do well the preliminary investigation work and also the study and preparatory work. When signing contracts, we must be serious and conscientious, the content must be specific overall, the stipulations must be clear and detailed. The words of the contract must be clear and exact. Contracts must not be concluded carelessly. Only in this way can the active function of contracts be developed in serving the development of foreign economic activity.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

'JINGJI GUANLI' ON TECHNICAL TRANSFORMATION

HK190357 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 81 p 3-6

[Article by Chen Yi [7115 2496]: "Overall Technical Transformation of the National Economy Must Be Carried Out."]

[Text] 1. The Readjustment of the National Economy Should Be Combined With Technical Transformation

During a period of economic readjustment, how to combine this readjustment with technical transformation is a question that should be seriously studied. At present our country's industrial situation is that while light industrial products and textiles are unable to meet demand, heavy industry, particularly the machine-building industry, is operating below capacity. To increase the light and textile industries' productive power by closing, suspending or amalgamating factories or switching them to other production is only a temporary measure and is not the best method. Such amalgamation and switching can neither greatly increase the productive power of the light and textile industries, nor can it help to accelerate the socialization and modernization of production. The current situation is one of "tearing down the eastern wall in order to repair the western wall." In actual fact, neither of these "walls" is newly built, as both have been in a state of disrepair for a good many years. Furthermore, this approach also raises two other questions: First, when most of the heavy industry is operating below capacity, how is the national economy to maintain a steady rate of growth; secondly, how should this temporarily-idle productive power be employed, readjusted, strengthened and improved? In the final analysis, implementation of the four modernizations must ultimately depend on heavy indsutry, and on the machine-building industry in particular.

For these reasons we should view readjustment as a positive measure and not as a case of taking down the eastern wall in order to repair the western wall. By combining readjustment with technical transformation, the whole of the national economy can be revitalized.

It was said recently by a leading comrade that, "in the past the emphasis was placed on new construction and external growth; now the emphasis is placed on technical transformation and internal improvement. This is a strategic change in our policy for construction. The need to make full use of our present material and technical base and to carry out an overall technical transformation of the national economy is an important task which influences the whole economic situation and one which now clearly faces all parts of the industrial sector, especially the machine-building industry." During the period of readjustment the use of the whole country's machine-building power to carry out a gradual technical transformation will allow us to kill two birds with one stone: as the level of the entire national economy is gradually raised and such a transformation is carried out throughout the economy, the machine-building industry itself will also be transformed. The phenomenon of lopsided development will then disappear.

2. If the Four Modernizations Are To Be Implemented, an Overall Technical Transformation of the National Economy Must Be Carried out in a Planned Manner

After more than 30 years of construction, our country has already established a complete industrial base. However, as far as the needs of the four modernizations are concerned, this is clearly not sufficient. If the year 2000 is assumed to be the target date for the initial implementation of the four modernizations, this means we still have 19 years left to go; or if one calculates from 1985, with the completion of readjustment, there are 15 years left; either way the period of time is not short. Both West Germany and Japan managed in the space of about 15 years to rebuild themselves into powerful industrial nations from the ruins of war. Furthermore, compared with them, our base is stronger, and conditions are slightly better. However, two other factors should also be taken into account: First, compared with China, Germany and Japan are relatively small countries with small populations. They also had some experience on industrial production, their people had a certain degree of education and, more important, both countries enjoyed American support. Our situation is thus very different from theirs. Secondly, the distance separating us from the advanced nations of the world is too great; this is true for all sections of the national economy. Examples of this can be drawn from agriculture as well as heavy and light industry: 5 percent of the American population live on the land and provide enough food for 200 million people, with per-capita grain consumption being around 3,000 jin. In our country, on the other hand, 80 percent of the population live on the land, which means that a force of 300 million strong farm laborers must support a total population of 1 billion, and the per capita grain consumption is only around 600 jin. With over 12 million workers our country's light and textile industries make up the largest part of the industrial sector. However, the people's level of consumption is still very low compared to other countries. Taking 1978 as an example, the average per-capita number of cotton goods produced in the developed nations was 3-4 times greater than it was in our country. As for chemical fibers and plastic products, the developed nation's per-capita rate of production was 21 times higher than it was in China. For synthetic detergents the foreign rate of production was 14 times higher and for sugar and paper it was 13 times higher. The productivity of our country's workforce is also less than it is abroad. For example in America the spinning of a piece of 20-count yarn requires only 1.5 man days, while in our country it takes 6.5 man days. Our country's steel industry has as many workers as the combined workforce of the American, Russian, Japanese and West German steel industries. However, the actual level of production is less than 10 percent of the combined production in these 4 countries. Our country's coal industry employs over 3.8 million workers, which is about the same as the total number employed in the important coal-producing nations; however, our coal industry accounts for only 20 percent of total world production. While over 80 percent of foreign coalmines have been fully mechanized, only 28 percent of our major mines have such equipment. Our country's power generator installed capacity is only 10 percent that of America's and 50 percent of Japan's. In terms of workers and the number of machine tools, our country's machine-building industry is the second largest in the world; the value of output, though, is 1/9 of America's and 1/4 to 1/3 of West Germany's and Japan's. Labor productivity in the machine-building industry is about 1/12 to 1/10 of that in America, West Germany and Japan. As for the machine-building industry's production of export products, America, West Germany and Japan produce 150 to 200 times more than our country does; France and Britain produce 100 times more; and even several small East Asian nations produce 5 to 7 times more. Our machine-building industry's utilization rate of steel is only 65 percent, while in advanced foreign countries it is up to 80 percent. The floating capital turnover in our machine-building industry takes about 221 days, while in America it is 70 days and in Japan 76.

For these reasons it can be seen that while our country has a certain industrial and technical base, the actual productive power is extremely low. At present the critical question is how to use our present base and promote its improvement and development. There exist two possible solutions: the first is to make a determined effort to liberate productive force by reforming any irrational relations of production which may now exist. Generally speaking, if improvements are made in this area there should be no problem in increasing productive force by 1/3 to 1/2. The alternative solution is to basically use our present technical and economic base as the starting-point for a full-scale technical transformation of our national economy, that is, of our current productive power. This will mean the renewal of critical equipment, the upgrading of backward technology, the reorganization of irrational productive units and the use of modern managerial techniques and methods to strengthen the administration and management of enterprises. It can be said that aside from these two alternatives, there is no other shortcut.

3. The Regular and Sustained Introduction of Technical Improvements Into Industry Is a Common Way of Developing Productive Forces

An overall survey of Western nations' industrial development shows that while the construction of new factories is a continual process, most new factories are built during the initial period of industrial development. In later periods, the introduction of technical change in old factories is a more common way of achieving a higher level of performance. In the last 10 or so years in particular, the rapid development of science and technology, combined with the intensification of competition, has resulted in a constant striving for lower prices which, in turn, has benefited both technological and economic development. There are several common methods of achieving this: The use of the existing economic base combined with a strengthening of scientific and technological research; the renewal and replacement of outdated equipment; the adoption of advanced techniques; and the improvement of administration and management. Such efforts to develop production and maintain forward momentum by carrying out continual and sustained transformation of existing industry is what we mean by placing the emphasis on technical transformation and internal improvement rather than on new construction and external growth. Why is it that many foreign countries have proceeded in this manner? First, such improvement is not only cheaper and faster than new construction; it can also allow for a more effective use of the existing base; second, because improvement is continuous and technology accumulates easily; third, because such improvement is meant to meet relatively short-term needs, one can keep a clear view of the situation;

feasibility studies should be relatively simple and it should also be easier to manage the economy in a rational manner; fourth, even though there may be mistakes in the plans for improvement, errors can be corrected easily and actual losses should be small. In short, this scientific economic approach derives solely from the realities of the situation.

There are many factual examples: for the past few years the number of machine tools in the advanced industrial nations has not increased greatly, and in some cases has even decreased; production, however, has still continually increased. For example, in America before 1960 there existed a steady proportional relationship between the growth in the number of machine tools and the increase in production. After that date production increased at a rate of 20 percent every 5 years. In 1978, however, the number of machine tools had declined by 14 percent compared with 1973. At the same time, however, the number of numerically-controlled machine tools and processing centers doubled; production lines increased by 20 percent and overall production during this period went up 20 percent. In Japan the situation was very similar. Between 1967 and 1973 the number of machine tools increased by a little over 20 percent, while the actual output value quadrupled. This shows that the forces and level of production do not depend on a numerical increase in equipment and enterprises but rather on qualitative improvement. Comrades who return home after studying this problem abroad all say that in the industrially developed nations it is not at all uncommon for old factories to be producing goods which can still compete on the international market. On one occasion a general engineer visited a steel-rolling mill in a Western country; the manager pointed to a steel-rolling machine and said, this machine dates from the 1950's but it is still more efficient than new machines because of continuous technical improvement. He also expressed deep regret over the fact that our factories are only used and never improved. In Japanese industrial circles it is often said that, "the process by which an enterprise continually develops and prospers is a process of continual technical improvement." Although Japan's social system is different from our own, this statement holds true for our country as well, and deserves serious thought.

For the past 10 or more years capital construction has been the centre of efforts to increase productive forces. For a number of reasons, the problem of duplicate construction is a very serious one, and the utilization rate of equipment is very low, which results in a wastage of manpower, materials, financial resources and time. In the heavy industrial sector, our country has more heavy machine plants than any other country in the world; furthermore, many of these plants rank among the world's largest. However, there are also many factories which even after many years in operation have still not reached full capacity. Take the case of our country's hydraulic presses for example: While we have more such presses than Japan, Western nations' orders for forgings of several hundred tons or more are always placed with Japanese factories. What is more, we are often unable to produce forging of over 10 tons for ourselves, and many of our hydraulic presses lie idle. If a general survey were carried out of the whole country's economic results, people would be shocked by the number of examples of such waste.

Once a capital construction project has been put into operation, why is not it possible to quickly bring the productive forces into full play? The most basic reason for this is that while we have a system of capital construction we have no system for the transformation of production techniques. There are numerous financial channels designed to assist capital construction projects; however, when it comes to the funding of technical improvements, not a single channel exists. Therefore a newly-built factory is expected to be a sort of "money tree" which only has to be shaken to produce and needs neither pruning, weeding, watering, or fertilizing. The result of this is that its effectiveness decreases daily and it gradually withers away. The classic example of this was during the 1960's, when we imported a complete factory to produce hydraulic equipment from Japan. The factory was in every way the same as factories of the same class in Japan at that time. After 10 years, however, the factories in Japan had increased their output 6 times and were already producing the 3d generation of their product. In our country, on the other hand, things were still the same as they were 10 years before, and in some areas production had even deteriorated.

The introduction of technical improvement into our existing economic base not only increases productive forces at a faster rate; it is also cheaper and relatively profitable. Under the present circumstances, it is very common for people to think that because capital construction demands large amounts of money, it should be included in our economic plan; technical improvement, on the other hand, is merely a question of accounting and cannot be included in the general plan. Such an approach is entirely mistaken.

The implementation of overall technical transformation of our national economy is, of course, a very large project. An optimistic estimate would be that it will be difficult to complete the task in less than 10 to 15 years. For this reason it must be carried out in stages. We must first of all gain experience by transforming those enterprises that produce products very important to the development of the national economy. Such transformation must be based on a scientific foundation and should also accord with economic and technical reality. The results of such a transformation should be the development of our country's productive capacity, the raising of the technological level, the increasing of the economy's efficiency and the creation of greater accumulation for the state. Products of which there is a domestic shortage should certainly be considered as targets for technical improvement. We will need to reduce imports and increase exports and also to increase the quality of domestically increased products. For example, the supply of products such as bicycles and sewing machines is unable to meet demand. We should investigate whether or not it is possible to use the whole country's machine-building capacity to carry out technical improvement in these factories (for decades most of our nation's industrial investment has been used to increase our productive capacity for primary products, and very little investment has been used to increase our productive capacity for secondary products. As a result there are many light industrial factories where not only is the equipment antiquated and techniques backward, but even the working environment is substandard. Technical transformation should certainly be carried out in such factories.) In addition to technical improvement we should also implement the system of socialist cooperation and division of labor. The organization of several large groups each producing from 5 to 10 million bicycles would strengthen the development of each smaller unit. As for reducing imports and increasing exports, the reform of several factories will not only increase foreign exchange revenue but will simultaneously reduce foreign exchange expenditure. According to statistics, during the last 3 years we have imported more than 4 million tons of steel plate at a cost of $2.2 billion. Naturally, such imports cannot be continued for a long period of time, and we should make a determined effort to use a portion of this expenditure to carry out improvements in one of our steel-rolling mills. Such an approach would certainly benefit the state. The conservation of energy is another area where money can be saved. Our country has many inefficient boilers; but if we were to spend money on reconditioning them we would be able to save 1 ton of coal for every 60 yuan invested. If, on the other hand, we wanted to increase the production capacity of coal by 1 ton, it would require an investment of around 200 yuan. A comparison of these two cases clearly demonstrates how worthwhile technical improvement is. There are many other such examples. In sum, it can be said that no matter whether we look at technical improvement from a macroeconomic point of view, from a long-term point of view or from the point of view of the cause-and-effect relationship that exists between the economy and financial revenue, we can feel equally confident. Some leading comrades now insist that we should study the way in which money is made, accumulated and used. In a society there exist numerous sources of funds; financial allocation is not necessarily the only way of finding the funds necessary for technical improvements; economic methods can also be used and may even yield better results.

4. The Role of the Machine-Building Industry in the Technical Transformation of the National Economy

A leading comrade once said that, "the machine-building industry is the national economy's equipment section." It was said in the past that, "the machine-building industry is the heart of industrialization" No matter which phrase we choose to use, both emphasise the crucial role to be played by the machine-building industry in the technical transformation of the national economy.

There are, at present, two incorrect views of the machine-building industry. One of these views underestimates both its capacity and level, and seems to suggest that since nothing is any good we should even start importing products which we have been producing domestically for decades. In actual fact, in our existing technical and economic base over 80 percent of the equipment was domestically produced. Why is it that such things were good enough in the past but now simply won't do?! Certainly, domestically-produced equipment has certain shortcomings compared with equipment produced in the advanced industrial nations: it does not form complete sets, its reliability and durability are sometimes deficient, and the service is often poor. Some of these problems are scientific and technical, others are managerial, while others are problems of materials. All of these problems must be carefully solved. However, there exists another more important problem, which is that the state must have a policy that protects and supports its own industry. If this is not the case it is impossible to talk of self-reliance; and the loss of self-reliance would certainly influence the progress of the four modernizations.

The other view is that the machine-building industry is too big. Therefore, as soon as any mention is made of readjusting this industry, the problem is always seen in terms of drastic cuts, closures, suspensions, amalgamations and conversions. Such a view pays too much attention to quantity and not enough to quality. There are also people who say, quite correctly, that our machine-building industry is too bloated. With about 3.8 million machine tools, our country ranks second in the world in terms of the number of machines. However, if this is analyzed a little more closely it can be seen that of these machine tools over 100,000 date from before the revolution; another 100,000 were imported during the 1950's; another

800,000 are machines that were produced before "the great leap forward;" and during the great leap forward itself about 1 million machine tools were produced. Of the products dating from the "great leap forward" and the "cultural revolution," many were manufactured in a shoddy and slipshod way and their quality is often below standard; as a result many such machines, lying idle in factories, have become a real burden. There are probably only about 900,000 relatively standard machine tools divided among 170,000 different factories. Some 100,000 of these machines are run by people's communes, and the remainder belong to more than 1,500 small and medium enterprises. It is thought that key enterprises account for only about 600 of these enterprises. This means that there are probably no more than about 1,000 enterprises that will be able to play a positive role in the future.

About half of these 900,000 standard machine tools have already exceeded their service life. In one machine-building complex, most of the equipment is already more than 20 years old; in another one 70 percent of the equipment is more than 20 years old; there is even one enterprise in which 80 percent of the machine tools are over 25 years old. Abroad, the depreciation period for equipment is usually about 5 to 10 years; in our country it is 30 years. For these reasons our machine tools need constant repair; some have been overhauled up to 10 times. It should be pointed out that after a machine tool has been overhauled it is only possible to restore 96 percent of its original precision; after a second overhaul another 6 percent is lost; after a third time another 15 percent is lost, and by the time a machine tool has been overhauled for a fourth time, only 60 percent of its original precision rating remains. In actual fact, once a piece of equipment has been overhauled three times, not only does its level of precision decline, but the amount of money spent on repairs begins to exceed its original net value. The fact that our country's equipment has such a long depreciation period means, in reality, that there exists no system for the renewal of equipment, and much of our equipment is already old and inefficient. If, as well as being unable to produce precision products, we continue to use this substandard equipment to produce generation after generation of equipment, the standard will certainly get lower and lower. Low productivity, high cost and low utilization rate of materials also all flow from this same problem. For this reason the machine-building industry itself also has a serious problem with technical improvement.

Should we first transform the machine-building industry, and only when this is accomplished, set about reforming other sectors; or should we adopt a proportional approach and try to improve each industry a little? Neither of these methods seems to be particularly appropriate, for the following reasons: First, the existing productive capacity of the machine-building industry needs to be brought into full play; secondly, there needs to be a demand for machine products; thirdly, most of the capital needed to carry out technical improvement in the machine-building industry should come from that industry itself. Therefore, the introduction of technical improvement into this industry must depend on the technical transformation of other industries; that is to say, the machine-building industry should serve other industries in a practical and realistic manner. Through the process of helping other sectors to carry out changes, the machine-building industry itself will also naturally achieve a degree of technical improvement. This is not a before-and-after relationship, but a relationship of dialectical development. In Japan the machine-building industry was at the centre of their development plan. First of all, 10 or so products were chosen as targets for technical improvement; the object of this was to increase exports and reduce imports with a view to improving the foreign exchange balance. Our objectives are not entirely the same; and our economic relations are also different. The machine-building industry will act as both the equipment section and the technical reform section for the overall technical transformation of the national economy. For this reason, only when we have taken the transformation of the whole national economy as our starting-point can we then decide the order and process of transformation in the machine-building industry.

5. Several Questions That Should Be Answered Before Technical Transformation Is Carried Out

(1) The technical transformation of the national economy is an extremely complicated and painstaking task; it will require a unified plan, constant reappraisal and scientific verification. The leadership and command system which carried out Japan's machine-building industry restoration was more unitary block than our country's. Each of our country's industrial sectors has its own sphere of control, and the scope of our national economy's technical transformation is far wider than it was in Japan; for these reasons the task is much more difficult than it was in Japan. Without strong and powerful organization and leadership and without a unified plan, nothing can be accomplished. The formulation of a realistic and feasible plan for technical transformation will require the participation of a great number of experts. Problems such as what should be improved and what should be improved first should be subjected to repeated scientific analysis.

(2) The overall technical transformation of the national economy is a major strategic decision. As with the construction of 156 major projects in the first 5-year plan, no effort should be spared. Moreover, compared with the period of the first 5-year plan, we have many more methods today. If the state wants to meet some of the problems involved in technical transformation by introducing various items of legislation, such measures must first be passed by the permanent organs of the NPC, which have absolute authority, and only then will legislation be legally binding. In this way a unified understanding can be reached and affairs can be managed according to law.

(3) The phrase "technical transformation" should be understood in a broad sense. It refers to both the improvement of material conditions and also the readjustment and reform of organization and management. Because of this, when we carry out technical transformation it will be necessary, on the one hand, to reform any irrational parts of the superstructure and, on the other hand, to break away from the limitations of the different forms of ownership. The implementation of this plan and the carrying out of reorganization should be relatively centralized. Otherwise, we will end up expending a lot of effort for small results because none of the different channels link up; and this opportunity for reform could end by merely exacerbating the phenomenon of a divided system with numerous large and small independent units.

(4) The state should have a policy of supporting those enterprises in which technical transformation is being carried out. Depending on the particular circumstances of each enterprise, the government should make special provisions for loans and taxation.

In short, this is a major undertaking that requires full cooperation in all areas, as well as joint study and investigation.

'JINGJI GUANLI' ON DEVELOPING COLLECTIVE COMMERCE

HK191235 Beijing JINGJI GUANLI /ECONOMIC MANAGEMENT/ in Chinese No 9, 15 Sep 81 pp 44-45

[Article by Zhang Qipan [1728 0366 3140] and Li Xiuyi [2621 0208 5030] of the Ministry of Commerce: "Collectively-owned Commerce Should Be Greatly Developed"]

[Text] Since the 3d plenary session of the 11th CCP Central Committee, in the implementing the policy of readjusting, restructuring, reorganization and upgrading of the national economy, readjustment and reform have also been implemented in the realm of circulation of commerce and have progressed in the direction of more types of economic elements, more management forms, more circulation channels and fewer intermediate links. This has made possible the rapid recovery and development of collectively-owned commerce and the catering and service trades, and has thus played an active role in enlivening the market and bringing about a prosperous economy. The ups and downs of our collectively-owned commerce and the catering and service trades over the past 30 years have shown that their existence and development are in conformity with the economic conditions of our country, that they are essential, and that in reality they form an important constituent part of socialist commerce. To weaken collective commerce is to weaken socialist commerce. In fact we have endured much suffering in this connection and have learned a very painful lesson therefrom. It awakens us all the more to see that the current flourishing growth of collective commerce and the catering and service trades in an important step to the strengthening and improvement of socialist commerce and is the natural result of the development of the socialist economy. At the same time, it makes us clearly understand that following the readjustment of the national economy, the development of production the increase in commercial circulation channels, and the demand for improved social services, collective commerce and the catering and service trades still need to be greatly developed.

I. Experience and Lessons Gained From the Growth and Decline of Collective Commerce

In the early period of the founding of the PRC, collective commerce in our country was only in one single form and that was the supply and marketing cooperatives. During the transitional period, in restructuring agriculture; the handicraft trade and capitalist industry and commerce, we began to gradually organize the small merchants and small pedlars scattered throughout the country into cooperative stores and cooperative units. As a result, this gave birth to another type of collective commerce. By 1956, following the basic completion of the socialist restructuring of the private ownership system of the means of production in the great majority of areas in the country, collective commerce in the form of cooperative stores and cooperative units had already reached a certain degree of development. In 1957, the size of the staff of the cooperative stores and cooperative units in the country was about 3.59 million people, comprising 46.1 percent of the total number of people engaged in socialist commerce at that time. In addition, some 950,000 small merchants and pedlars remained in the independently-operated individually-owned commerce. In 1958, under the influence of "leftist" guiding ideology, these stores and units were reorganized under the pretext of "promoting" them or putting them through the stage of "transition," and collective commerce which had only started to grow, took a sharp downturn and suffered a serious setback. By 1960, there were only 980,000 people working in cooperative stores and cooperative units. Moreover, with the network of state-operated commerce steadily merging small units into big units, the size of the collective commercial network swiftly dwindled to 72 percent of what it had been before within 2 or 3 years. In 1961, the policy of "readjusting, consolidating, filling out and raising standards" was adopted with regard to the national economy. Many of the stores or units which had been "promoted" or were "in transition" were able to recover their original status successively. However, due to the adoption of various inadequate policies, the cooperative stores and cooperative units, though staging a certain comeback, were still not able to regain their 1957 level. In the course of the 10 years of turmoil, collective commerce in the form of cooperative stores and cooperative units was looked at as a "capitalist tail." They were subjected to the policies of "transition" and "replacement." In some localities, the stores were forcibly closed and the people inside were driven away. What remained of the cooperative stores and cooperative units were converted into state-operated units, while their reserves which they had accumulated over a prolonged period of time and their public welfare funds were taken away. They lost completely their special features of independent accounting, responsibility for their own profits and losses, and lively operations. During this period, the collectively-owned supply and marketing cooperatives were also incorporated into and placed under the system of ownership by the whole people. Since then, commerce under the system of ownership by the whole people has ruled the country and basically speaking the situation has become one wherein there is a single circulation channel and business is run by one single unit. By 1978, compared with 1957, while the retail sales volume of commodities of the society increased by 220 percent, the number of points in the commercial network dropped by 52 percent and the size of the working staff increased by 11 percent.

What kind of problems and influence these ups and downs in the course of the development of collective commerce have exerted on the realm of commercial circulation and what experience and lessons are to be learned therefrom must be earnestly summarized. Only by clearly understanding these problems can we further eradicate the influence of "leftist" thought. And only in this way can we, in our future work, actively support the development of collective commerce, correctly display and utilize the functions of collective commerce, enliven the circulation of commodities, greatly improve the social services, promote production development, make life easy for the masses and fully meet social needs.

Looking at the two stages of setbacks for collective commerce, namely, one from 1958 to 1960 and the other from 1966 to 1976, the problems that directly presented themselves were the large decrease in the number of commercial network units or points, the oversimplification of the social services, and the inability to meet the demands for production development, for improvement of the people's standard of living, and for strengthening the channels of circulation. In turn, this has bred a series of problems among which the principal ones are: (1) The daily life of the people has met with many "difficulties"--difficulties in shopping, eating, clothing and repairs and maintenance. These difficulties not only remained unsolved for a long time but were even greatly aggravated due to the steady increase in the population of society. (2) To a certain extent, weakening of the servicing capacity of circulation invariably results in lengthening of the circulation process. This constitutes an immense social waste. It is indeed frightening to imagine the losses occasioned in the time element by the masses having to queue up for purchases on account of the decrease in the number of service units of the commercial network. According to an investigation made in Beijing, each year 700 million hours of valuable time are lost by people in the city due to their having to walk a long distance and to stand in line when doing their shopping. This has not taken into account yet the fact that wholesalers have to stockpile their goods on account of the small number of retail stores, nor of the adverse effects that such a state of affairs may engender. (3) Collective commerce and the catering and service trades can very well provide employment for a large number of people and thus help to solve the employment problem of the society. Restricting the development of collective commerce would block the road to employment as a result of which, on the one hand, there would be jobs with nobody to fill them and the needs of the society could not be met while, on the other hand, there would be many people with nothing to do and the unemployed unable to find jobs on time. (4) If the constituents of the commercial economy are basically confined to only one type of commerce, namely, that under the system of ownership by the whole people and the mode of operation is uniformly fixed at doing 8 hours of work a day, then the situation would be highly depressing and stereotyped and the people's livelihood needs can hardly be met. All the above illustrates one point, namely, that commerce under the system of ownership by the whole people cannot manage the entire burden of promoting production development, making life easy for the people and enlivening the circulation of commodities. In particular, it cannot take up the task of adequately attending to the multifarious and complex needs of the people's livelihood. It must have some complementary and supporting force such as collectively-owned and individually-owned commerce.

2. Development of Collective Commerce Reflects Social Needs

In the course of reforming the circulation structure calling for the existence of diversified forms of economic components, diversified operational forms, numerous circulation channels and a small number of intermediate links, the various types of collective commerce and individual commerce have claimed the most rapid development and produced the best results. In less than 2 years between 1979 and 1980, the number of points in the collective commerce network reached 763,000 units, occupying 37.7 percent of the total number of points in the whole social commercial network. This sector employed 3.33 million people comprising 36 percent of the total number of people serving the society's commerce. At the same time, there were 686,000 points in the individual commerce network, occupying 33.9 percent of the total number of points in the whole commercial network of the society. In all, 897,000 people were employed, making up 9.7 percent of the total number of people serving social commerce. The number of collective commerce network points in the urban areas in 1980 increased by 69 percent over 1978 while the number of points in the individual commerce network increased by over 3,000 percent for the same years. The rapid development of collective commerce and individual commerce reflects the needs of the society and is well received by the populace.

This development in collective commerce and individual commerce brings about thoroughgoing changes in the realm of circulation. First of all, it breaks down the unitary type of operation and the single circulation channel of commerce under the system of ownership by the whole people. It forms a social commercial structure of multiple economic components, and adds strength to the domain of circulation. In particular, it displays its important role in many sectors of commodity circulation which commerce under the system of ownership by the whole people cannot reach. In this way, the longstanding contradictions resulting from the serious insufficiency in the number of commercial network points are relieved to a rather large extent. At the end of 1980, there were 2.369 million units in the social commercial network, an increase of 1.03 million over 1978, or an increase of 76.9 percent. At the same time, the door of employment was opened wide and jobs were found for several million people awaiting employment. This not only helped strengthen social service work but was also beneficial to stability and unity. Moreover, collective commerce and individual commerce have the special features of independent accounting, responsibility for one's own profits and losses, ability to start business early and close later, ability to do business along alleys or at street corners, dexterity in operation, being convenient for the populace and enlivening the market. They are able to fill in the gaps, extend their business hours, increase their service items and, in short, meet social needs by means of taking various service forms. The longstanding problems of difficulties met with in shopping, eating, clothing and in general repairs and maintenance work are being gradually solved. They are complementary to commerce under the system of ownership by the whole people but are also its competitors. The special features of their operation have served to promote changes in the operational methods of commerce under the system of ownership by the whole people, overcome the bad demeanor of "officials running business," improve management and control and enhance the quality of service.

This active role of collective commerce and individual commerce fully illustrates that their existence and development are in conformity with the national condition of our country, suit social needs and possess enormous vitality. This indeed is the basic reason why for a prolonged period of time, and despite the many ups and downs, they have been found to be indestructible and irreplaceable. Our country is big, and has an enormous population but a weak foundation. The development of social service enterprises cannot depend entirely on investments from the state. The employment of social labor power cannot be entirely made by enterprises under the system of ownership by the whole people. Only when state-operated and civilian-operated enterprises are combined together can we achieve greater, faster, better and more economical results. In collective commerce the units are small and are diversified. The investments required are small and faster results are achieved. In comparison with commerce under the system of ownership by the whole people, considerable savings in investment can be effected. According to an investigation made in Shanghai, in the catering trade, the average amount of fixed assets (not including the dining rooms) required per individual employee was 625 yuan in state-operated establishments but only 85 yuan in establishments under collective ownership. In the state-operated service trades, the average amount of fixed assets required per individual employee was 827 yuan whereas it was only 146 yuan in service trades under the system of collective ownership. On this basis, if the number of people additionally employed over the last 2 years in collective commerce and individual commerce were employed by enterprises of state-operated commerce, the state would have required additional investments amounting to 2 to 3 billion yuan. Hence, concurrently with the development of state-operated commerce, the principal direction hereafter for addition to the points in the commercial network and providing people with employment should be the development of collective commerce.

3. Consolidating and Developing Collective Commerce Is a Long-Term Policy

Collective commerce as an important constituent of socialist commerce will coexist for a long time with commerce under the system of onwership by the whole people. The present development of collective commerce is by no means a temporary measure but is instead a long-term policy. Departments of state-operated commerce should learn well how to correctly utilize this important force of collective commerce so as to better fulfill the tasks in the realm of circulation. They should give help and support to collective commerce on various sides, absorb their experiences and improve their own management. The viewpoint and practice of discriminating against collective commerce are the influences of "leftist" ideology and must be thoroughly eradicated. Staff members of collective commerce should rest assured, strive to learn business techniques, develop and grasp the ability to run enterprises, correctly carry out the policies of the state, do a good job of running enterprises, and make more and greater contributions to serving the people. It would be entirely erroneous to consider collective commerce as unreliable, and to believe that collective commerce is inferior to state-operated commerce where everyone "eats out of a big pot" and has an "iron rice bowl." This is because state-operated commerce just the same has to go through reform in order to solve the problems of "eating out of a big pot" and having an "iron rice bowl." Only in getting a full understanding of all these matters can collective commerce attain consolidation and development.

At present, collective commerce still faces a number of problems in its development. Besides such considerations as the political rights of staff and workers, their social status, their enlistment in the armed forces, their schooling or going to college and computation of working age all of which the state has already made definite provisions for, the problems still requiring solution are: (1) respecting the decisionmaking power of collective enterprises and assurance of the principle of more work more pay in distribution. In enterprises which have done well, the staff should receive a higher income than that in state-operated enterprises and the staff of state-operated enterprises should not be jealous and nor should the departments in control attempt to place such limitations as levying extra taxes or making special appropriations. (2) Collective commerce must have the assurance that it can operate normally. In the supply of goods or raw materials and in the pricing of commodities it must be treated the same as the same type of state-operated retail stores and must not be discriminated against. (3) The governing principle should be that whoever starts the business should be in control. The control of collective commerce should be strengthened. The internal administration system of the enterprises should be gradually perfected. Reserves and welfare funds should be set up. Income receipts should not be completely distributed or consumed. The development of the enterprise and a group welfare scheme for the staff must depend on the accumulations of the enterprises themselves. Without accumulations the enterprises will not have a firm foundation. (4) The relevant departments in control should treat collective commerce in the same light as state-operated commerce. They must be put under unified planning and their geographical distribution must be rational. They must be made to develop in a planned manner and according to the needs of the social structure. The setting up of network points for collective commerce should follow the principle of whoever runs the unit should do the building work and the departments concerned should provide the necessary support. If according to needs a municipal government engages in building up station points, it should assign to collective commerce a portion of the points on a compensatory basis. In general, we must start from a long-term view and formulate a definite policy for the protection of collective commerce to the end that it can continually be consolidated and improved and progress in a healthy manner.

It must be pointed out that in the last 2 years, following the development of collective commerce, the commercial network of the social structure has grown considerably in size and notable results have been achieved. But viewed from the standpoint of social needs, a great disparity still exists. In 1957, on a yearly average basis each point or unit in the retail sales network served some 331 people. In 1980 the number of peoples so served increased to 672. Quite obviously, the problem of the insufficient number of service points in the commercial network is a pressing one. Hence, in addition to the development of commerce under the system of ownership by the whole people, collectively-owned commerce must also greatly develop.

'JINGJI YANJIU' CITES SPEECHES AT SEPTEMBER MEETING

KH191310 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 10, 20 Oct 81
pp 16-21

[Summaries of speeches delivered by Sun Yefang [1327 0396 2455], Chen Hansheng [7115 5060 4563], Chen Daisun [7115 1486 1327], Yan Zhongping [0917 0022 1637], and Luo Gengmo [7482 5087 3351] at the first annual meeting of the Chinese Federation of Economics Groups]

[Text] Editor's Note: The first annual meeting of the Chinese Federation Economics Groups was held in Dalien from the 3-6 September. Over 300 people attended the meeting, including representatives from various economic societies, federations and research institutes, and representatives of news agencies. This meeting was the first large-scale meeting of the economics circles since the founding of the republic. At the meeting, Comrade Yu Guangyuan, adviser to the Federation of Economics Groups, delivered a speech entitled "Develop the Science of Economics and Better Serve Socialist Modernization." Advisers to the federation, Comrade Sun Yefang, Chen Hansheng, Chen Daisun, Yan Zhongping and Luo Gengmo also spoke at the meeting. In this issue, we are publishing the text of Comrade Yu Guangyuan's speech in full and summaries of the speeches by Comrade Sun Yefang and the others. (The titles of the summaries of the speeches, outside of that by Comrade Sun Yefang, were made by our editorial department. [End Editor's note]

On the Problem of Linking Together Theory and Reality and Letting a Hundred Schools Contend -- Sun Yefang

I shall talk on two problems. One is the linking together of the theory and reality and the other is the promotion of academic discussion, that is, the problem of letting a hundred schools contend.

The purpose of our forming the federationof economics groups is to promote the development of the science of economics. But this is only an organizational measure and is the promotion of this work from only one aspect. In order to upgrade the science of economics, we must do two things well. First, all people in economics circles, and naturally this includes myself, must seriously and penetratingly study the original theses of Marxism-Leninism, particularly "Das Kapital" by Marx. During the period of the "cultural revolution," "Das Kapital" was slandered as having the "function of a horse's tail." Lin Biao said: "Das Kapital" could only explain the problem of capitalism but not that of socialism. This was nonsense! "Das

Kapital" not only explains clearly the laws governing a capitalist society but also explains the basic laws governing a socialist society. We must read "Das Kapital" repeatedly and study it repeatedly. Why should we overthrow the capitalist system and set up a socialist system in its place? In constructing a socialist economy, what kind of principles must we follow? In "Das Kapital" Marx supplies us with the answers in principle. Hence, we should not only urge the younger generation to repeatedly read "Das Kapital" but also encourage our older comrades to do so as well. In recent years, people have accused our economists of writing articles or developing theories which contain confused concepts and divergent views. Generally speaking, academic thinking and concepts always grow from divergent to unity. Hence, there is nothing strange in the confusion of the concepts or in the divergence of views. However, we must gradually unify our thinking and concepts and should not allow them to remain confused or divergent. How then should this unity be brought about? The answer is that they should be unified on the basis of Marxism and on the basis of the "Das Kapital," the basic work on Marxist economics.

Naturally, we cannot copy or apply mechanically Marx's writings, including "Das Kapital." Marx and Engels not only did not see socialism in practice, but also did not see some of the new things in today's capitalist economy. But we should still follow the basic principles of Marxist economics to explain these new phenomena and these new problems. We oppose the doctrinairism of copying or applying mechanically and we also oppose pragmatism or empiricism which take and accepts things as they are and is the opposite of the basic thoery of Marxism.

The zigzag road which we have traversed over the past 32 years in our research work on economic theory and our actual financial and economic work was not due to our use of any of the tenets in "Das Kapital," but rather due to our violation of many basic principles long ago pointed out therein. Even the many defects in the economic control system which we introduced in the 1950's were not due to our violation of the basic principles therein. For this reason, we Marxist economists should well propagandize "Das Kapital." As for the many new things not touched upon in "Das Kapital," we must also follow the basic theories of "Das Kapital" to seek further elucidation. At present, certain comrades are interested in many new concepts and new ideas introduced from the West. In this regard I am not a conservative. I feel that in Western economics there are many useful things which we should absorb, particularly economic metrology, departmental economics, enterprise management and so on, all of which we can learn from. The West has had many good experiences in the field of economic management and control. However, in regard to political economics, Marxist political economics is radically different from the capitalist political economics of the West. We cannot readily borrow its concepts and terms. At the present, there is already a random use of certain terms and categories of Western economics. But what is the criterion to determine which concept should be introduced and which not? In my opinion, we should use Marxist classical theses as the criterion, and in the case of economics, particularly "Das Kapital." Hence, I believe that to promote the development of the science of economics, we must advocate the study of the calssical works of Marxism, particularly "Das Kapital."

At the same time, if we wish to raise the standard of economics and promote the development of the science of economics, we must pursue investigation and research. Actually, this is long-standing pclicy. Our articles (including mine) are full of empty talk and have little content. One of the reasons is that we lack a realistic approach, are not in touch with the pulse of the economy, and are inclined toward abstract problems. Therefore, I hope that the academic societies of the Federation of Economics Groups will not only advocate but also organize and plan some worthwhile topics for investigation and research, go deep into the countryside, factories and stores, make friends with the peasants, workers, storekeepers, particularly comrades doing financial and accounting work, or planning or statistical work, observe and learn from life, and thus do some model type of investigative work. At the same time, we should do investigation and research in collaboration with the planning and statistical departments which deal with problems comprehensively. That articles by our economists are devoid of content and substance may be ascribed to the lack of statistical materials. Economists in general have no access to comprehensive statistical materials. I fervently hope that the statistical bureau can satisfy the wishes of the economics circles.

Linking theory with reality, study in Marx's works and doing a little investigation and research--these were what Comrade Mao Zedong advocated during the first and second civil wars. He reiterated this again in the early 1940's during the rectification and education campaign when he voiced his opposition to Wang Ming's doctrinairism. Even now the works written during the rectification campaign can well serve as a motto for us in our theoretical research work. However, the "resolution" adopted at the 6th plenary session of the 11th CCP Central Committee pointed out that what led to Comrade Mao Zedong's errors in his later years was his losing contact with reality, cutting himself off from the masses, and the growing seriousness of his subjectivism and his air of despotism. In other words, during his last years he failed to carry out investigation and research on reality. Therefore, although linking theory with reality and doing investigation and research are longstanding policies, they still should be carried out and forever be new topics of discussion. Let us hope that this will always be remembered by those of use doing theoretical research work and those doing practical work.

The second problem I wish to touch upon is the promotion of academic discussion and the enlivening of the atmosphere of the economics circles. Academic discussion in economics is tantamount to the economics circles doing criticism and self-criticism work. "Letting a hundred schools contend" has been advocated for a number of years, but it has not been well developed. There have been few cases of our economics circles of consulting and discussing problems and even though were a few cases, little can really be said about them. Academic discussion should be criticism and self-criticism as well as criticism and countercriticism, or judgment and counterjudgment. This is the normal phenomenon for academic discussion. Unfortunately, for many years we have not acted in this way. Indeed, if one was named in an article as being opposed to the views of somebody else, that was something extraordinary. As far as I know, in this regard the historical circles are much more open-minded than our economics circles. Nevertheless, their discussions still centered more on historical events. There have been little criticism and discussion by name on real historical viewpoints. In my opinion, academic discussion, also known as academic judgment or academic criticism, is nothing unusual but if you are unwilling to sign your name, others reluctant to carry on a discussion with you. If both sides are willing to sign their names in articles criticizing the other's views, then truly the economics circles will be enlivened. We should not be afraid of being criticized by name if our viewpoints are correct, but if the viewpoints cannot pass the acid test, the sooner other people criticize you by name, the greater indeed will be the help rendered to you.

Economics Science Should Be Studied for the Purpose of Application--Chen Hansheng

Studying for the purpose of application is an important problem. It is hoped that the Federation of Economics Groups will take this into consideration.

In the past, it was frequently found that we were unable to put to use what we had learned, and when the time came for application, we found that we had not learned enough. I have been thinking: Could it be that we had not learned enough and therefore were unable to cope with the application work? Or could it be that after learning we had no way to apply it? I feel that if we want to put to use our learning, then we have to rely on the government's political power and, when there is political power, we study for the purpose of application. The application of economic knowledge depends on practice and this has a close relation to the political regime at the time. The Kuomintang under the leadership of Sun Yat-sen was unable to implement his economic principles because at that time the political power was not in the hands of the Kuomintang but in the hands of the warlords, bureaucrats and landlords. At present, the situation in certain countries in Latin America and Africa is the same as that in our country before the liberation when our national capital had not been fully developed and the warlords were in power. If in the future, members of the Federation of Economics Groups can write a book on the economic history of contemporary China, then it will be a valuable reference material to many of the developing countries.

In regard to the problem of studying for the purpose of application, I feel that to implement the economic policies there must be rational organization structures, touching on various phases. After 1956, our party was lacking in democratic spirit, political life was abnormal and frequently the words of one individual were final. For example, at the time when cooperatives should have continued to be organized, suddenly there was the decision to organize people's communes. Originally, the policy called for developing agriculture first, light industry second and heavy industry third, but subsequently emphasis was laid on heavy industry while agriculture and light industry were relatively ignored. As a result, this brought about a series of bad effects. At present, our cadre system has one defect. That is, it concentrates only on personal affairs and not on business affairs, while those in charge of business affairs have no power over personnel. Those in charge of business affairs wish to do their work well and must have suitable personnel, but frequently they cannot get the kind of personnel they require and have to accept those assigned to them regardless of their suitability. The results are that the organizational structures have become ponderous. They have more hands than needed and their work efficiency is low. Under such conditions, although we have learned economic management methods we cannot find or put them to use. Naturally, before any improvement has been made in organizational structures, comrades in our Federation of Economics Groups should still help the cadres who lack in economic knowledge to find people versed in economics to help them to better implement our party policies.

Comrades doing research in economics should not confine themselves, in the course of their work, to reference materials only but should organize actual investigative work. Our research should be based on the analysis of materials derived from actual investigation. I am in favor of Comrade Sun Yenfang's suggestion of doing actual investigation. Because the formulation of our party policies should be based on reality, that is, derived from the people and eventually implemented among the people. Only in this way will the policies conform with the interests of the people. I hope that comrades of the Federation of Economics Groups will organize some investigative projects so that in the implementation of the 8-character policy, they will be able to offer constructive views. This is really studying for the purpose of application.

Linking Theory With Reality and the Development of Economics Science--Chen Diasun

It is indeed my good fortune to be able to take part in this first annual meeting of the Federation of Economics Groups. I am very happy to be here. This is the first grand meeting of the economics circles for more than 30 years. While extending my felicitations to the gatherning, I wish to express the hope that this meeting will be instrumental in the promotion of economic theory being closely linked with reality and in guiding reality. Teaching is my profession. I have much contact with comrades of the younger generation. Young comrades think in a lively way. This is good. However, in their thinking, certain problems do arise. For example, some comrades believe that Western economic theories have been continuously progressing and can solve the various problem confronting the capitalist economy. To them "Das Kapital" does not seem to have such a capability. Does this not mean that "Das Kapital" is out of date? Indeed, we cannot blame the youngsters for these kinds of doubts. As teachers, we should blame ourselves for not having done our work well. We did not, or could not, guide the students to learn how to link economic theories with reality and, to go a step further, how to employ correct theories in leading reality. From time immemorial, economic theories, or economics itself, may be said to be a kind of knowledge for use in application and not merely theories on paper. The problems it is meant to solve come from reality. After probing and studying, theories are formed and they in turn guide reality. The two Chinese characters for economics "jingji," were originally imported. The Japanese used these character to represent the so-called modern economics introduced from the West, and we borrowed them from the Japanese. Nevertheless, the origins of this terminology can be traced to our country. Formerly in China there was a phrase, "jing shi ji ming," ["tending the universe and helping the people"]. The term jingji is an abbreviated version of this phrase. Naturally, this former phrase encompassed a much broader scope than the scope of what we now call economics, since it was related to the various phases of the rule of the state or society. However, what we understand today as economics is one of the important phases. At any rate, when in earlier times the phrases "jing shi ji ming" or "wen zhang jingji" ["the theory of economics"] were used, any reference to jingji or economics carried the implication that it was linked with reality and was knowledge that was to be applied. Judging from the historical development of Western economics, there was not any stage of development in which economic theory was not linked with reality. From the classical economists in vogue in Western nations today, their objective was the solution of actual problems. In particular, Marxist political economics was an outstanding example of theory linked with reality and guiding reality. Yet, despite years of stressing the linking together of theory and reality, we have habitually forgotten about it. As a result, our economics has become mere armchair strategy and some young comrades cannot put theory to use in solving problems. Some people feel that Marxist political economics is useless. They urge borrowing from Western economics, believing that some of the theories therein might be well worth our copying. As a matter of fact, Western economics has certain points worthy of being drawn upon for reference. But contemporary Western economists always boast that their economics is based on reality and is not related to the problem of social value. Such a claim is erroneous and not in conformity with reality. This is because the economics of the capitalist class has the logical premise of protecting the capitalist system and the problems it endeavors to solve grow out of the capitalist system. The theories formed for the purpose of solving these problems are merely to serve this system. We had closed our doors for several decades. Now that the doors are opened, certain people are bewildered by new situations and believes that all things from the outside are good. Naturally, abandoning the closed-door policy is a great change. Our responsibility is to channel this change in the right direction.

The Federation of Economics Groups is a comprehensive organization. If it can join together the various departments engaged in economics science, it will greatly help to strengthen the link between theory and reality. We hope that the Federation will make contributions in this effect.

Study of Economic Theory Must Be Strengthened--Yan Zhongping

In my youth, I studied economics of the capitalist class and had no training in the study of history. In 1953, my organizational unit assigned me to write on economic history. Since economic history entails the science of economics and the science of history, it requires especially extensive training and understanding of Marxism. Since I had neither, I thought I could obtain some knowledge from my senior comrades, but unfortunately then and for over the past 20 years and more, I have been able only to find few writings in this aspect. So, I have been at a loss.

It must be acknowledged that since the founding of the republic, our senior comrades have gained much successful experience in their research on China's contemporary economic history. But of the 4,000-odd published articles on China's contemporary history, more than 2,000 were on the history of the Taiping heavenly kingdom, and many were on the peasants' uprisings and on general political history. Certainly all these historical events should be studied. But, basically speaking, was it not because of the difference or inequality in the economic status of the various classes that led to the outbreak of the various class struggles? Should we not pay attention to the history of the economic status of the classes in our research on this history of class struggle? However, while some people spent much time researching whether or not Hong Xiuquan had a moustache, the research on the problem of the economic status of the peasants during Hong Xiuquan's era receive relatively speaking, a cold reception.

Our country has placed the branch of learning of economic history within the department of the science of economics. Institutions of higher learning have established courses on economic history under the study field of political economics, while scientific research departments have set up economic history research offices or units in their economic research organs. The situation at present is: institutes or departments on the special study of political economics are currently offering courses on the economic history of contemporary China. Few have offered courses on the economic history of ancient China and even fewer have offered course on economic history of foreign countries. At the same time, students in the special departments of political economics concentrate on studying economic theories and problems and, generally, pay little attention to economic history. Could this also be true in so far as economic history is concerned with students in departments of special studies of history in the institutions of higher learning? Scientific research departments have placed economic history within their scientific research organs while few research organs on the science of history do not have their own economic history special research offices or units, but the research on economic history in economic research organs is more or less in the same situation as the course study of economic history is in higher institutions of learning.

This situation is like that of the tradition story that when there are only two monks in a monastery they usually had no water to drink because both of them refused to carry water. Since the economic foundation determines the condition of the upper layers of a structure, this uneven stress laid by historians on the economic foundation and on the upper layers of the structure is an error in strategy. Marx said that he knew of only one science and that was the science of history. Hence, the research on the history of economic development should provide the basic tool for all research on economic theories and economic problems. If a little more historical or quantitative sense is inserted in economic publications, they will no doubt have an even greater influence.

Several Hopes Concerning the Work of the Federation of Economics Group--Luo Gengmo

Only half a year has passed since the establishment in April this year of the Chinese Federation of Economics Groups. It has now 226 group members. If on the average each group has 300 to 400 individual members, then the federation is a big organization in the economics circles with a total membership of 70,000 to 100,000. This is an organization with great possibilities. Naturally, only through the smashing of the gang of four and the implementation of the correct ideological line of the 3d plenary session of the 11th CCP Central Committee are we able to meet together here today and are elated and full of vigor.

I wish to talk about some minor problems. They are: the federation's constituent group members have only been active in the last 3 years. Besides this, they can be characterized with two words, "lax" and "weak." What I mean here by being "lax" and "weak" is different from what newspapers and magazines have recently characterized the party's leadership as being "lax" and "weak." What I have in mind in using "lax" and "weak" is these are a temporary phenomena characterizing the federation's constituent group members in the early stage of its formation.

The federation is an academic organization of a public or civilian nature of new China's economic circles. Its group members all belong to the same category. Before the 10 years of turmoil, organizations of similar nature also had existed. Their number was small and their activities were limited. Lin Biao and the gang of four, with the aim of destroying the new socialist culture and using the pretext of "overthrowing the academic authority of capitalism," cracked down on all of them and not a single organization survived. So what we have been advocating in recent years in promoting the public activities of economics academic organization and the establishment of the Federation of EconomicGroups was tantamount to starting anew. Moreover, since the liberation, we have been accustomed only to the type of scientific research work that was mobilized administratively from the above, although some investigation and research work has been done at the initiative of the departments of finance, trade, industry and communications. While at the same time, there were no scientific research activities being carried out by academic economics organizations and these organizations lacked the experience and foundation that could have been derived from these activities. The scientific research activities that were carried out in the past by economics groups mostly depended on three types of people--teachers and economic research workers, workers in economic departments and retired comrades who were still interested in economic research. These people voluntarily devoted some of their time to this work and were not solely engaged in this effort. As a result, in the next 2 or 3 years the scientific research activities of these economics groups will probably continue to be loosely organized. They will have to depend principally on the scientific organs in the various localities and their members sense of responsibility under the guidance of the party's ideological line. Concurrently, the Federation of Economic Groups will have to attend to the necessary liaison and promotion work and gradually pull together to form an integrated whole. For this reason, I suggest that between the Federation of Economics Groups and its constituent group members, between the economics groups of the academic departments of the various localities and between all of these groups and their individual members that there be cultivation of good social behavior befitting a socialist civilian academic organization. There should be mutual respect, mutual understanding, and mutual assistance. Bad practices such as sectarianism, arrogance and conceit must be avoided. We must quickly and closely bind together the ranks of the older, middle-age and young generations of the economics circles of the entire country to make the needed contributions to socialist modernization.

The problem of the "weakness" of the Federation of Economics Groups which I mentioned has reference to the following condition of the federation: the academic ranks which it has joined together are numerically rather strong in regard to both the constituent groups and their individual members. However, measured in terms of their ability to serve the four modernizations and the quality of the scientific research work, they are still relatively weak. This is particularly true at the present stage. We must be deeply aware of this point. Many reasons have contributed to this "weakness," of which I mention three. First, during the 10 years of turmoil, the damages done by Lin Biao and the gang of four not only completely destroyed the economics academic groups which were still in their "infancy" stage and wrought this kind or that kind of havoc onto the economic theory workers versed in Marxism, confining them for a prolonged period in cowsheds separated from the outside world, but also disrupted the higher education for a whole generation of people. At present, in the whole country the economics departments of institutions of higher learning and economics scientific research organizations are all facing the problem of a temporary shortage of personnel. In general, they lack an integrated academic staff for the training of research students aspiring for the master's or the doctor's degree. Capable teaching staff and scientific research workers who can connecting link between the past and the future are sadly lacking. This hardly befits a great nation with a population of 1 billion people. This is one of the effects of the 10 years of turmoil. Second, we may trace back to the 1950's and find a political setting different from that mentioned above. In the past, the courses offered in the economics departments of the institutions of high learning were few and narrow in scope, and due to the influence of the "leftist" line, they were confined to using textbooks from the Soviet Union written in the 1940's and 1950's (although we must admit that at that time, they might still served some useful and beneficial purposes). The evolution of modern economic thought of the West, particularly management methods and economic technology and know-how, was almost entirely neglected in our research work and was not even introduced "with critical reservation" to the public. This of course greatly reduced the scope of our economic knowledge and level of development of our economics science. Somewhat related to this factor was the fact that our college students all had a rather low proficiency in foreign languages. The great majority of them were restricted to only one foreign language (Russian). Even at that, they could hardly pass the crucial test of using the language. Third, for a prolonged period the party's leadership cadres frequently paid no attention to cultivating and training a contingent of economic theoretical workers, or in any way supervising or supporting this type of work. For example, in the systematic and prolonged accumulation of economic materials so vital to economic theoretical work, economic teaching and research personnel (including medium-level and low-level cadres in economic departments) met with difficulties and obstacles which they cannot solve or remove. The leadership at higher levels were not aware of or failed to take note of such difficulties and consequently neglected to help solve problems. Up to now, the great majority of such workers have difficulty in obtaining economic statistical materials and other materials. This has brought about a situation which may be likened to the proverbial saying that the "cleverest housewife cannot cook a meal without rice." This is also one of the reasons for the slow upgrading of new China's standard of economics science. We hope that the leadership will show an all-round interest in the growth of a contingent of economic theoretical workers and help them to solve the problem of the supply of statistical and other materials and other problems relating to their working conditions.

Finally, let me express some views on the tasks of the Federation of Economics Groups in the next 3 years. In my opinion, in addition to doing well the work of popularizing the science of economics, the Federation of Economics Groups should arrange to promote and organize a contingent of specialists to compile publications on economic theories (embracing special-topic investigation and research reports) centering on the economic theoretical problems and practical problems related to the current readjustment and restructuring of the economy. The publications can be of the type that makes a hundred schools contend and encourage people to make even more exhaustive studies and pursue further scientific work. The federation may very well use this as a foundation to help members of groups in localities as well as the economics departments of institutions of higher learning to organize academic speech-making tours on a seasonal or rotational basis. This will help to supplement and upgrade the standard of teaching and of scientific research on the economics science. We should pay close attention to the analysis, research and appraisal of advance economic theories and economic model theories presently being introduced from the West and Eastern Europe. On the one hand, we must keep out any ossified and leftist thoughts, and on the other hand, we should take note of and see through the revised vulgar economic theories. We must not eulogize or propagate them as new "scientific development." This is very necessary at present.

NATIONAL POLICY AND ISSUES

'JINGJI YANJIU' ON ENTERPRISE PROFIT-SHARING

HK190241 Beijing JINGJI YANJIU[ECONOMIC RESEARCH] in Chinese No 9, 20 Sep 81 pp 68-74

[Article by Zhu Yen [2612 1484] and Cao Yifeng [2580 3015 1496] of the Institute of Economics of the Shanghai Academy of Social Sciences: "An Analysis of Profit-Sharing in Shanghai's Enterprises With Expanded Decisionmaking Power"]

[Text] The pilot projects on expanding enterprise decision-making power which started in our country in 1979 mainly involved expanding enterprise financial powers and replacing centralized control of income and expenditure by profit-sharing, while correspondingly demanding that enterprises assume certain economic responsibilities and that economic benefits be shared in accordance with the economic results of the enterprises' production and management, in order for the enterprises to increase labor productivity.

For the past 2 years, practice in the experimental enterprises with expanded decision-making power in Shanghai has shown that although this involved only partial expansion of enterprise powers, it has indeed started to mobilize the initiative in enterprise production and the workers' enthusiasm because it has grasped the key link of integrating enterprise economic benefits with their contributions. In particular, those industrial enterprises which were assigned production quotas short of their production capacity have been taking the initiative to open up new markets, improve management and expand production and sales. They have been able to increase production and income and achieve better economic results.

Both production level and economic results markedly improved in these enterprises compared with the period before the pilot projects were undertaken. Below are the comparative figures:

Over Industrial Output Growth Rate

Year	(Compared with previous year)	
	Shanghai	Pilot-project enterprises
1979	8.4 percent	12.7 percent
1980	6.1 percent	7.1 percent

Industrial Profit Growth Rate (compared with previous year)		Extent of Profit-Sharing
Shanghai	Pilot-Project Enterprises	Percentage of Total Profit
3.7 percent	15.5 percent	5.3
2.9 percent	7.0 percent	8.0

Average Bonus	
Shanghai	Pilot-Project Enterprises
100 percent	136 percent
100 percent	152 percent

The above chart shows that the pilot-project enterprises were able to realize the principle of "increasing state income, enterprise profit-sharing and individual income"--that is, of simultaneously taking care of the interests of the state, the enterprise and the individual--on the basis of increased production and income. In handling the relationship among the three parties, individual income of workers and extent of enterprise profit-sharing were placed within reasonable limits and individual benefits received by workers were determined by the extent of benefits realized by the enterprise.

In 1979, total amount of profit-sharing in pilot-project industrial enterprises in Shanghai reached 473.86 million yuan. In 1980, with the increase in number of enterprises experimenting in expanding decisionmaking power, the amount of profit-sharing also rose to 767.30 million yuan. Of the total amount of profit-sharing in the 2 years, production development funds accounted for 45 percent, collective welfare funds 29 percent and worker incentive funds 26 percent.

With the above-mentioned funds, the pilot-project enterprises are able to depend on their own financial resources to undertake structural renovation of old enterprises and achieve the intensive type of production increase by tapping potentials, reforming and restructuring. The enterprises also have more funds to improve the workers' collective welfare facilities, particularly, to solve the workers' housing problem; and to raise the average amount of bonuses in pilot-project enterprises to 36 to 52 percent above the average for industrial workers in the municipality.

With the expansion of enterprise financial powers, there was also a corresponding increase in the economic responsibilities they assume. This resulted in gradual improvement in the level of enterprise operation and management and the strengthening of economic accounting work. Reforms have promoted the consolidation of enterprises. These have been the most important results of reform.

However, it can also be seen from the above chart that although the annual growth rate of profit in pilot-project enterprises is way above that in ordinary enterprises, the growth rate in 1980 was lower than in 1979. The same is also true with ordinary enterprises. According to the analysis of the municipal statistics bureau, this phenomenon was caused by several factors. One of them is the faulty method of enterprise profit-sharing. Let us proceed to discuss this question.

I

When pilot projects in expanding enterprise decision-making power started in Shanghai in 1979, the method of having enterprises share both basic profit and appreciated profit was adopted. The total profit in pilot-project enterprises in 1978 was taken as the basic profit, with profit-sharing rate set accordingly, and once set, this figure was not to be changed for 3 years. Annual profits realized after the pilot project began, if larger than the basic profit, were considered appreciated profit. In 1980, pilot-project enterprises were still sharing profits according to the amount of basic and appreciated profits. However, the difference is that basic profit for each year is set according to the amount of proift realized in the previous year. Thus, basic profit changes every year.

In 1980, there was a great number of enterprises which undertook pilot projects in expanding decisionmaking powers. They adopted the method of cyclic ration. For fear that overly high profits during the current year would affect the increase of appreciated profit in 1981, in 1980, when increase in enterprise production and income reached a certain level, many enterprises turned their efforts to equipment inspection and repair, and few devoted efforts to further increasing production.

At that time, pilot projects in expanding enterprise decision-making power had the tendency of spreading to ordinary enterprises. Thus, this also affected those enterprises which had not undertaken the experiment. These enterprises feared that if their profit quotas for the current year were too well fulfilled, their basic profit level would be correspondingly raised and they would be in a position of "disadvantage" when the time came for experimenting in expansion of enterprise powers. This was an important reason why total industrial output in Shanghai for the second half of 1980 was lower by 2.5 percent compared to the first half.

Of course, the enterprises' worries reflect certain contradictions existing between partial and overall interests. At the same time, they even more vividly reflect the shortcomings of the present method of enterprise profit-sharing. That is to say, the present method of enterprise profit-sharing fails to correctly embody the issue of proportional relationship between enterprise economic interests and the contributions they have made. Practice in the past 2 years revealed many problems, focusing on the issue of imbalance of profit-sharing rate among pilot-project enterprises, which in turn creates the contradiction of inequality in enterprise income and bonuses given to workers. Due to the gap between high and low profit-sharing rates, these rates failed to reflect the efforts exerted and contributions made by many enterprises. There were instances where advanced enterprises which have done basic work well, exerted great efforts and contributed much received only little economic benefits. This is the key problem.

II

To realize profit sharing, we must shift from the method of including certain expenses and capital (including funds for new product development, scientific research and worker training) in appropriations from the higher levels or in operating capital to the method of including these items in that part of profit which is retained by the factories, in order to establish the link between the factories' economic benefits and their operational results and to strengthen their sense of economic responsibility.

According to regulations, the amount of profit-sharing in enterprises experimenting in expansion of enterprise powers in Shanghai is divided into two parts: basic profit-sharing and appreciated profit-sharing. The sum of the two is the economic benefits received by enterprises. Individual benefits received by workers are apportioned according to a certain ration from the amount of profit shared, and are determined by the amount and distribution ration of the profit shared. Can this method of profit-sharing properly reflect the efforts exerted by the pilot-project enterprises in their production and management and establish a corresponding link with the economic benefits they receive? Let us analyze this in detail.

Let us first analyze the components of the amount of enterprise profit-sharing.

Amount of Enterprise Basic Profit-Sharing Rate Appreciated
Profit-Sharing Equals Profit X for Basic Profit Plus Profit

X Profit-Sharing Rate
for Appreciated Profit

(Basic Profit-Sharing Rate Amount of Basic)
(Profit X for Basic Profit Equals Profit-Sharing)

(Appreciated Profit-Sharing Rate Amount of Appreciated)
(Profit X for Appreciated Profit Equals Profit-Sharing)

In the above formula, the basic profit is a known quantity. It is determined by the total profit realized by pilot-project enterprises during the previous year; that is, basic profit for enterprises joining the pilot projects in 1979 is determined by their total profit in 1978, while that for enterprises participating in 1980 is determined by their profit in 1979.

Appreciated profit represents the remainder when basic profit is subtracted from the annual profit of pilot-project enterprises. When basic profit is set at a high level, appreciated profit becomes correspondingly smaller; when basic profit is set at a low level, the same amount of profit results in a bigger appreciated profit.

The profit-sharing rate for basic profit is computed according to certain formulas and it differs from one pilot-project enterprise to another. The average profit-sharing rate for basic profit in the municipality of Shanghai in 1979 was 4.2 percent. Profit-sharing rate for appreciated profit is fixed. In pilot-project enterprises adopting the fixed ratio, it is set at 10 percent, and in those adopting the cyclic ration, it is set at 20 percent. The reason why profit-sharing rate for appreciated profit is much higher than that for basic profit is that this brings forth enthusiasm for increasing production and income. However, this also easily leads to the possibility of pilot-project enteprises taking legal measures to lower the amount of basic profit.

The total amount of profit-sharing in enterprises is made up of two components parts. Here, the profit-sharing rate which affects the amount of basic profit-sharing differs from factory to factory. This is an effort to use different basic profit-sharing rates to enable pilot-project industries starting with various amounts of profit during their initial period to arrive at relatively balanced amounts of basic profit retained. The formula for its computation is as follows:

The denominator is the total profit realized by the pilot-project enterprise during the year taken as base.

The numerator is, as mentioned above, those expenses and capital that should be appropriated from retained profit after an enterprise undertakes the pilot project. These are to be computed according to certain proportions which they account for the enterprise's overall appropriation for wages or in the total profit. They are roughly equivalent to the amount appropriated from higher levels or taken from capital expenditure or enterprise profit during the base year.

Profit-sharing rate for basic profit computed according to this formula differs according to the differences in total profit of enterprises during the base period and the differences in the amount of related expenses and capital expenditures of various enterprises. Basic profit-sharing rates computed according to this formula range from low to high, with some as low as 1.94 percent and others as high as 16.5 percent, although the great majority are below 10 percent.

The pilot-project enterprises can arrive at the amount of economic benefits they are entitled to during the base period by multiplying the amount of profit realized during the base period (basic profit) by the profit-sharing rate for basic profit. If the pilot-project enterprises want even greater economic benefits, they must increase production and income during the experimental period, and create appreciated profit, in order to enjoy appreciated profit-sharing.

At first glance, this method seems to be very fair. Moreover, this method of computation guarantees that the state's financial income will not be lower than the level during the base period.

However, on closer inspection, this method is premised on blanket affirmation of the actual conditions in various pilot-project enterprises during the base period, and these conditions include many abnormal and irrational elements. Thus, the fault of "uniformity" exists because the differences in the operational conditions in the various pilot-project enterprises during the base period were not taken into consideration. This computation method dictates that some enterprises' economic benefits are fated to have no connection with the contributions they could make, and that some pilot-project enterprises should suffer unjustified losses while others should enjoy undeserved additional benefits. This will not only dampen the enthusiasm of some pilot-project enterprises but will also weaken the positive role of the expansion of financial powers in promoting economic development.

III

The profit of industrial enterprises is a comprehensive index which shows the level of production and management. How well it is realized is determined by the factory's type of production tasks, composition of product varieties, method of production organization, effectiveness in operations and sales and the lowering or increasing of production costs. Lastly, it is also determined by whether the pricing system for the products is rational or not.

To take a factory's production and management as example, whether production capacity is fully utilized and the level of production cost reduction decisively affect the profit level of the factory.

In the formula for computing basic profit-sharing rate, the denominator is the total profit. If the numerator remains constant, the bigger the denominator, the smaller the basic profit-sharing rate; the smaller the denominator, the bigger the profit-sharing rate. Thus, during the year taken as base, among factories with similar production conditions, those pilot-project enterprises with full-capacity production tasks or which have brought productive capacity into full play and those enterprises which achieved remarkable results in reducing production costs created large profits. In turn, the denominator in the formula was bigger and thus, the resulting profit-sharing rate was ironically smaller. If we analyze this in relation to historical conditions: Those pilot-project enterprises which, during the base year and the years immediately before that, increased production, reduced production costs, and turned over in progressively greater amounts of profit to the state every year were sure to have a very low basic profit-sharing rate. This rate was inversely proportional to the contributions made by these factories. On the other hand, those which during the base year did not have full-capacity production assignments or which did not make full use of their production capacity due to various reasons, and those pilot-project enterprises which raised production costs due to improper operations and management, certainly realized less profit than usual, and thus, their contribution to the state was small. However, when they joined the pilot project, their economic benefits were not reduced accordingly but on the contrary, their basic profit-sharing rate was high. The problem does not only lie here. With low level of basic profit, it was of course easy to realize a large appreciated profit during the experimental period and this correspondingly brings about undeserved "advantage" in terms of appreciated profit. The extent of this "advantage," in turn, is inversely proportional to the efforts these pilot-project factories exerted in their operations and management.

Many believe that the inequity in the economic rewards received by pilot-project enterprises is caused by the differences in appreciated profit-sharing. That is not true. Its root cause lies in the faults of the method of basic profit-sharing. With the progress of pilot project work, these faults have become more evident. They have become definite obstacles in extending the accomplishments of the pilot project. The "reservation" of the enterprises which are about to join the pilot project in increasing production and income is a silent protest directed against the faults of this profit-sharing method.

The numerator in that formula refers to: expenses for testing new products, operational expenses for scientific research establishments and workers' training costs, workers' welfare funds, bonuses for workers and enterprise reserve funds. The first two items are incidental to a certain extent. We will not discuss them. The last three items should be linked to the overall appropriation for wages in pilot-project enterprises during the base period, or should be computed according to certain percentages in the overall amount for wages according to regulations. The overall volume of wages is determined by the number of workers and average wages in various pilot-project enterprises during the base year. Those pilot-project factories which had many workers and high average wages had a great overall wage volume and welfare funds, bonuses and enterprise reserve funds computed according to set percentages were big in amount. Otherwise, the situation was the exact opposite. Following the formula, if the denominator remains constant, the bigger the numerator, the higher the resulting basic profit-sharing rate; the smaller the numerator, the lower the profit-sharing rate.

Take two pilot-project factories as example. If during the base period they realized the same amount of profits and their production conditions were the same or similar, then that factory with more workers and higher wages would have a higher basic profit-sharing rate than the other factory that had less workers and lower average wages. This is one aspect of the problem. On the other hand, whether during the base year, the questions of the number of workers in the pilot-project factories was reasonable--that is, whether it was compatible with the production scale of the factory--whether the work norm was of an advanced level and whether work hours were fully utilized were not analyzed and taken into consideration in computing the basic profit-sharing rate. Thus, inevitably, the result was: those factories with too many workers, which were oftenly idle and which wasted work hours during the base year received more benefits after they joined the pilot project than those factories which made fuller and better use of their work hours.

From the foregoing analysis, we can see: The fault of the method of computing basic profit-sharing rate lies in indiscriminate and blanket affirmation of the production conditions during the base year and in not conducting scientific analysis in accordance with the current situation of production and management in the factories. We did not start from the overall goal of promoting the production level in various enterprises and formulate a more rational method of computing profit-sharing rate. This is the root cause of the irrational nature of profit sharing among pilot-project factories.

IV

Let us now analyze some actual examples of pilot-project enterprises in Shanghai to serve as supporting evidence for the above points.

The Wujing Chemical Plant is a big enterprise. In 1978, there were many problems in its production: industrial accidents often led to power failure in the whole factory and there was serious waste of materials. Take for example the raw material sulphuric acid. Upon stocktaking, the waste of mineral ores alone amounted to 12,200 tons, raising per-ton raw material consumption by 74 kilograms. Thus, the profit quota for that year was not well fulfilled. The basic profit-sharing rate for that plant computed according to these conditions was as high as 16.5 percent. This overly high profit-sharing rate computed with an overly low profit as base brought this plant great advantages when it participated in the experiment on expanding enterprise powers. After the plant joined the pilot project in 1979, to deal with the problems in enterprise operations, it undertook reorganization in equipment, techniques, production safety and the plant's physical appearance. As a result, production order was rapidly restored to normal, the incidence of industrial accidents was reduced, while per unit consumption and production cost were also markedly reduced. The overall output value in 1979 was 25.7 percent more than that of 1978 and profit realized was 240 percent that of 1978. Because of low basic profit and high basic profit-sharing rate, that plant was able to have the best of both worlds. In 1979, that enterprise shared a total profit of 3.038 million yuan and each worker was able to receive an average of 335 yuan in bonuses, the highest among 76 pilot-project enterprises in the whole municipality. That plant has adopted a fixed ratio system and this ratio will not be changed in 3 years. In 1980, the profit realized showed a still more remarkable increase, amounting to 254 percent of that of 1978.

The heightening of the enthusiasm of the workers in the Wujing Chemical Plant after it joined the pilot project was the main reason why it was able to increase production and income in 2 consecutive years. However, part of the reason why the enterprise shared such a substantial amount of profit was obviously because of the unreasonable base figures. Logically, a part of the profit should have been handed in to the state, but because of the fault of the method of computing basic profit, it was retained by the plant. Similar situations and problems exist in some other pilot-project plants to various extents.

Another situation that explains overly low basic profit was that during the base period, the pilot-project enterprise was at the stage of testing new products.

Both the Shanghai No 3 and No 4 watch factories are pilot-project enterprises which joined the experiment in expanding enterprise powers in 1979. Both used 1978 profit as base and adopted the method of fixed ration profit-sharing, a ratio that does not change in 3 years once fixed.

The Shanghai No 3 Watch Factory has been producing the Haishi brand of men's watches and has thereby accumulated considerable experience in watchmaking. In 1978, it began to produce the S3-1 Shanghai-brand ladies' watch. During the experimental period, it concentrated efforts on checking techniques and solving problems concerning product quality. Thus, its production capacity was not fully utilized, while the cost of testing new products was high. Naturally, the base profit was low. This ironically became a favorable condition for increasing enterprise profit-sharing when the factory joined the pilot project.

The "Zuanshi-Brand" watch produced by the Shanghai No 4 Watch Factory is a high-quality and well-known product in Shanghai. It formally went into production in 1970. Over the years, the factory tried to tap potentials every year. By 1978, production output had grown 10-fold and profit had increased by 376 percent. After joining the experiment in expanding enterprise powers, because of high basic profit, its extent of increasing production and income was somehow restricted. The economic benefits received by this enterprise were paradoxically less than the No 3 watch factory.

Below is a comparative chart of the increase in production and income and extent of profit-sharing in the two watch factories after they joined the pilot project:

1978 (Base Period)

Name of Enterprise	Basic Profit (in 10,000 yuan)	Profit-Sharing Rate	
		Basic	Appreciated
Shanghai No 3 Watch Factory	373	8.07	10.00
Shanghai No 4 Watch Factory	2,065	3.92	10.00

Total Profit and Profit
Shared (in 10,000 yuan)

1979		1980	
Profit	Profit Shared	Profit	Profit Shared
914	84.8	1,538	147.1
2,693	144.0	3,250	199.6

Total Labor Productivity (Yuan)		Average Bonus per Worker (Withdrawn) (Yuan)	
1979	1980	1979	1980
28,579	35,142	220	359
51,996	56,893	180	271

Factory No 3 and Factory No 4 in the above chart are both old factories with rich experience in watchmaking. The "Zuanshi-Brand" is even a famous brand. Just because Factory No 3 test-produced ladies' watches in 1978 and that year was incidentally the "base period" when it joined the experiment on expanding enterprise powers, powers, its basic profit-sharing rate was more 200 percent that of Factory No 4, while its appreciated profit-sharing rate was the same as that of the latter. Thus, the following irrational situation came into existence: although the overall quality index of the No 4 Factory in the past 2 years was higher than that of Factory No 3 by 16.57 and 13.43 points respectively, and total labor productivity surpassed Factory No 3 in 2 consecutive years by 82 and 62 percent respectively, the ratio of profit shared to total enterprise profit, based on the chart, was 9.2 and 9.5 percent for Factory No 3 and only 5.3 and 6.1 percent for Factory No 4, while the average bonus withdrawn per worker in Factory No 4 was only 81 and 75 percent respectively that of Factory No 3.

It is usually believed that the inequity in benefits enjoyed after enterprises joined the pilot project is due to the difference in appreciated profit-sharing, because in designing the basic profit-sharing, the assurance that the economic benefits of the enterprises be maintained at the level of the base period had been taken into consideration. This is a superficial view. The problem precisely lies in the fact that inequality already began at the base level. Thus, once the pilot project started, the "good" or "bad" results in enterprise profit-sharing could already be predicted.

Another extreme case was setting the basic profit at zero. That means indiscriminately branding factories which lost money during the base period as money-losing units.

The "Feiyu-brand" of television set is a famous brand. It is produced by the Shanghai No 18 Radio Factory. In 1978, that factory was mainly producing 9-inch television sets and amplifiers. The 9-inch television set was a money-losing product while the amplifier was making a profit. Adding up profits and losses, the factory was making a read profit or more than 800,000 yuan. Yet counting the losses incurred by disposing with materials at a reduced price amounting to more than 2.3 million yuan, the factory, in the end, incurred a loss of 1.53 million yuan in 1978.

In 1979, the Shanghai No 18 Radio Factory participated in the pilot project to expand enterprise powers. Its profit-sharing ratio was set and could not be changed for 3 years. Due to the fact that in 1978, the balance sheet showed it to be a money-losing unit, its basic profit was set at zero and all the profit realized during the 3 years of the pilot project was to be considered "appreciated profit." According to regulations, those enterprises adopting the "fixed ratio" have a uniform appreciated profit-sharing rate of 10 percent (a very small number of pilot-project enterprises have a rate higher than 10 percent). This is higher by 138 percent, compared with the municipal average of 4.2 percent for basic profit-sharing rate. This "uniform" policy on appreciated profit-sharing rate has aggravated the situation of inequity in economic benefits among some pilot-project enterprises.

After the Shanghai No 18 Radio Factory joined the pilot project in 1979, its product composition was changed. The 9-inch television set was eliminated, while the output of the 12-inch television set which was making money reached 80 percent of overall production. Profit realized during this year was 11.08 million yuan, which was all regarded as appreciated profit, and profit shared was 1.08 million yuan. True, the expansion of enterprise decisionmaking power mobilized the factory's enthusiasm. Yet, part of the profit was undoubtedly brought about by the change in product composition. This should be considered a favorable objective factor. Pilot-project enterprises have different favorable objective factors which vary tremendously. For example: different modes of production; different organic composition of capital; changes in product composition; different proportion of net production value in overall production value, and different ratio between products for domestic and foreign trade. These factors all affect the degree of profit increase. In particular, the price factor (including prices of finished products, raw materials and associated materials) exercises wideranging influence because price seriously deviating from actual commodity value is a commonplace phenomenon. The existence of these influencing factors has made the objective measurement of enterprise subjective efforts even more difficult. However, in most cases, the appreciated profit-sharing rate is "uniformly set." This makes the pilot-project enterprises bear the burden of the good or bad economic results brought about by objective factors to enterprise profit. As a result, in the pilot-project enterprises' profit-sharing, some received benefits very easily and some suffered losses without justification, and this is also reflected in the workers' economic benefits.

In Shanghai, in order to solve the problem of "inequity of benefits" among pilot-project enterprises, methods of internal adjustment within various trades were adopted by the industrial bureaus and companies that were practicing profit-sharing in an entire trade. These had certain effects on alleviating the contradiction of "inequity of benefits" among enterprises, but they also had their limitations. This was because these methods did not try to solve the problem by tackling the root cause, while profit rate in various trades differs greatly. Therefore, it is difficult to solve the problem of "inequity of benefits."

V

The main purpose in expanding enterprise decisionmaking power is to make the enterprises an internal economic force in enlivening the economy and improving production and management. To make the enterprises fully play their role as an internal economic force, the economic benefits they receive must be linked to the quality of their operation and management and with their contribution to the state.

We believe that in order to solve the problem of inequality in enterprise profit-sharing and to better implement the principle of simultaneously looking after the interests of the state, the enterprise and the worker, attention must be paid to the following questions:

1. At present, the phenomenon of industrial product prices deviating from actual value is very commonplace. This is an important objective factor outside the factories which affects the profit volume of enterprise and contributes to the inequality in profit-sharing. This problem exists between trades and between enterprises to various degrees. For example, the profit realized by each "Shanghai-brand" men's watch is as high as 37 yuan while the industrial profit per unit (1,000 boxes) for "Shengchan-brand" matches is only 1.42 yuan. There is a great gap between the two. This is the result of the state policy of centralized control of income and expenses in state-run enterprises, which was instituted during the 1950's after socialist transformation was basically completed. Obviously, this is incompatible with the requirements of the reform of the economic structure. We must undertake adjustment of prices in a planned and step-by-step manner. However, it takes a long time to institute a rational price system. Moreover, factors that influence prices, aside from the value base, include policy requirements, demand and supply relationship and so on. Thus, under certain conditions, it is inevitable for prices to deviate from value. Therefore, it is desirable to use the tax lever to supplement price policies and extract through taxes that part of enterprise profit which is created by objective favorable conditions.

2. Compared with the average enterprises in the country, most industrial enterprises in Shanghai have higher standards of operation and management and high profit level. It is obviously not always appropriate to adopt the "cycle ratio" method in enterprise profit-sharing. Perhaps, according to actual conditions in different types of enterprises, we can adopt different profit-sharing methods, such as fixed ratio, cyclic method, total profit retention, basic profit-sharing plus appreciated profit-sharing, sharing profit in excess of planned quota and assigning fixed profit quotas. In this manner, we can better mobilize the enthusiasm of the enterprises and the workers.

3. Whether the setting of basic profit is rational or not is a key question that bears on the inequality of economic benefits. Thus, we must not simplistically take the actual profit of the enterprise concerned during the base year as the base figure. We must compute the reasonable profit volume of the enterprise under normal production conditions and make this the base figure. We believe that the measures for the subjective efforts exerted by the enterprise are: the extent production capacity is utilized and the level of production cost. These are two decisive factors that bear on factory profit volume. Therefore, we must correctly determine a relatively rational way of quantifying these two major factors.

There are objective criteria for measuring whether the production capacity of a factory is being properly utilized. Generally, this means making a comprehensive analysis of how far the factory utilizes its designed capacity or its overall production capacity, whether it has attained the highest level in history and how well the production tasks have been fulfilled during the base year. Thus, we can arrive at a relatively reasonable basis for computation.

By relying on the above actual analysis of enterprise production capacity and production cost level, while referring to the actual profit level during the base year and deducting the objective favorable factors in the enterprises, we can surely set down a more rational basic profit volume. This is a solution to the shortcoming of "uniformity." Only thus can we enforce a more rational profit-sharing scheme, encourage the advanced units and stimulate the backward ones. Furthermore, we can also lay down the groundwork for future advance from profit-sharing to "independent accounting, state taxation and self-responsibility for profit and losses."

FINANCE AND BANKING

STRENGTHENING FINANCIAL MANAGEMENT OF PRODUCTION TEAMS URGED

Jinan DAZHONG RIBAO in Chinese 10 Sep 81 p 1

[Article by staff commentator: "Conscientiously Reorganize and Strengthen the Financial Management of Production Teams"]

[Text] Under the new situation of implementing the production responsibility system in agriculture, how to handle the financial management of the production teams has become an outstanding problem that the broad number of farmers are generally concerned about. The commune members said: "The responsibility system is the bamboo rake to bring in money; financial management is the cash box to hold money." This discription is very expresive and very appropriate. Only by striving for more income and managing the income well can there be increased yields and increased income.

Of course, the financial management of the communes and brigades at present is still a weak link in business management. This is clearly manifested in the following: in some units, costs are not calculated in production, the costs are high and the results are poor. Management of property and materials is poor, loss and damage are serious. There are too many subsidies for banquets and giving gifts, wasteful eating and drinking and various inappropriate subsidies; the burden of the commune members is heavy. There is too much borrowing and misappropriation, there is too much improper retention of capital, there are too many debts unpaid, distributions that should be realized cannot be realized. The accounts are confused, there are no records of receipts and expenditures, finances are not made public, the economy is not democratic. Some units contracting work to the families do not close old accounts, do not establish new accounts, do not clarify debts, there is no record of fixed assets. A few units have even divided the property of the collective, eliminated the accountant, etc. If the confusion in financial management in the collective economy is not quickly reorganized, the results of labor by the commune members will be wasted, the socialist principle of distribution according to work cannot be truly implemented. Therefore, handling financial management well is a very important and urgent task facing us. The party and administrative leadership organs at each level in the farm villages must grasp financial management like they have grasped the production responsibility system, help the production teams carry out a conscientious reorganization and truly handle financial management well.

Reorganizing financial management first of all involves clarifying all accounts, thoroughly clarifying assets and materials, debts and various expenditures and revenues. The results of clarification should be publicized for the commune members, and the masses of cadres should be mobilized to summarize the experience and lesson. The goal of clarifying the accounts is to bring problems to light, to understand the causes, eliminate shortcomings, accept the lessons, and improve the level of management. Clarifying the accounts is not launching a movement, it is not purging the cadres, it requires mobilizing the basic level cadres to take the intiative to do the work well and to boldly lead. The general financial problems that existed in the past should not continue after they have been understood and examined and corrected. Major individual cases of theft and embezzlement should be handed over to concerned departments for special handling, they should not be included in the reorganization of finances. Second, measures for improvement should be studied on the basis of clarifying the accounts, and a sound financial management system should be established. Regarding productive financial expenditures, those that can be contracted should be contracted as much as possible, those that require quotas for expenditure should be placed under quotas, the portion conserved should be kept, and overexpenditures should not be subsidized. Collective property and materials should be placed under a strict responsibility system: good management should be rewarded and poor management should be punished. Plans for retrieval and repayment of debts that cannot be cleared immediately should be clearly recorded in the books and contracts should be signed with the creditor for retrieving and repaying debts according to contract. Fixed assets must be redepreciated according to the actual situation and how new they are. They should be accounted for so that the real assets and the books are consistent, a depreciation system should be established and a responsibility system for the control, repair and use should be established. Analysis of economic activity must be carried out by the month or by the season to tabulate revenues and expenditures at fixed intervals; it should be posted for comparison with the same period last year and for comparison with similar units; the reasons for increases and reduction should be analyzed, the experience and lessons should be summarized, and measures to increase revenue and conserve expenditures should be studied.

Although collective revenue and expenditure items and accounts of units contracting production and work to the family have lessened in number, accounting personnel still have a lot of work to do. For example, helping the brigade committee establish production plans; signing contracts for production and work with each family; representing each family in uniform purchases and distribution of chemical fertilizers, farm chemicals, and superior seeds; collecting from each family the farm sideline products to be sold and closing the accounts; calculating and managing monetary subsidies for food grains for martyr families, "five protected families", families in difficulty and their special care; managing and using well the money from food grains kept by the collective; keeping good accounts so as to show the cash flow, posting the accounts for the masses and accepting supervision oy the masses; and clarifying and managing well the original debts, transferring them to new accounts and supervising their retrieval and payment. As regards the original collective property, regardless of whether it still belongs to the collective or whether it is to be distributed to the families according to established prices, the accounts should all be managed according to the accounting system. The various forms of contracts and deeds, accounts, vouchers, bills and reports formed after collectivization and such financial files must be kept well. At the same time, the collective still must carry out some work benefiting the life and production of each family which the family does not have the ability to realize or which is not suitable for the family to implement. Accounting personnel must carry out or participate in carrying out all these things; accounting work is still very important. The view that after contracting production and work to the families, accountants have nothing more to do and so can be eliminated is wrong.

Reorganizing financial management involves a broad area, the situation is complex, there are many problems and questions of policy are involved, so the county commune party committee and government must strengthen the leadership of this work. Responsible comrades must undertake the work and carry out profound actual investigation and study, discover problems in time and handle them well. Business departments must take the initiative to do the trial work well, to seek experience and to serve as good consultatants to the leadership. Reorganizing finances is very detailed economic work, it is not something that can be done at one blow; we must strengthen the constant ideological and political work and the guidance in operation, combine the proper production responsibility system with yearend distribution, and carry out work according to plan and in stages and in groups.

Financial management work mainly relies upon the accountants for implementation. The caliber of the accountants determines to a very great extent the quality of financial management of the unit. Therefore, selecting good accountants, strengthening training, instituting periodic examination, and training a Red and expert accounting team constitute the basic construction in financial management. Only when the basic work has been done well can the active function of the accountant be truly developed to handle financial management well and to promote the more prosperous development of the collective economy.

BRIEFS

JIANGSU RAW COAL PRODUCTION--In August, the whole province's production of raw coal was 1.33 million tons, a surplus of 65,000 tons, creating the highest monthly yield this year. The Xuzhou Mining Bureau conscientiously implemented the spirit of the national unified distribution of coal production conference, truly strengthened leadership and began implementing the economic responsibility system, thus mobilizing the enthusiasm of the broad number of workers. In August, it produced over 980,000 tons of raw coal, a surplus of 25,000 tons. Xuzhou, Huaiyinba, Yancheng, Yangzhou, Nantong Prefectures, the city of Lianyungang and the provincial Taihu Coal Company all overfulfilled their August production plans. THIRD MINISTRY OF MACHINE BUILDING INCREASES ASSISTANCE TO CIVILIAN INDUSTRIES

Beijing GUANGMING RIBAO in Chinese 7 Oct 81 p 1

[Article by Correspondent Tang Ding [2768 0002]: "Third Ministry of Machine Building Has Outstanding Results in Readjusting Its Service Orientation"]

[Text] Since the Third Plenary Session of the 11th Central Committee, certain enterprises and research and design organizations belonging to the Third Ministry of Machine Building have readjusted their service orientation, and while giving priority to completing military research and production tasks, they have organized their technical personnel to visit civilian products enterprises, gain an understanding of their technical difficulties and help them solve their problems; some of the enterprises have thrown open their doors and invited visits by representatives of civilian products enterprises or have taken the initiative in explaining and introducing new processes and technologies, as well as doing some preliminary work to spread new technologies, all of which has yielded outstanding results.

Their methods are as described below.

Adopting results from military work. For example, aircraft engines have been converted to ground-based gas turbines which are used as high-efficiency, light, easily controllable power installations which can use a variety of fuels; one variety of turboshaft engine and two varieties of turboprop engine have already been adapted as power units of this sort and are being used in the petroleum industry as electrical generators or water injection units. In addition, various aircraft electric motors, instruments and oil pumps are being converted for use in mines, light industry and textiles, chemical engineering, hoisting equipment and automation equipment.

Providing technical services to civilian products departments. Last year the Sanjiang Mechanical Engineering Works sent technical personnel on many fact-finding visits to the Wuliangye Liquor Plant, where they designed and produced a mechanized continuous bending machine, solving the difficulties which the plant, which produces Wuliangye, one of China's famous liquors, had encountered with bending processes, and increasing liquor production efficiency and bending quality. The Third Ministry of Machine Building's Power Research Institute sent about 30 engineers and assistant engineers to investigate domestic and foreign results and adopt advanced military technologies and equipment in developing this country's first complete automated bread production line, which produces an average of one loaf of bread (weighing 2 liang) per second. Some plants trial-produced certain advanced, versatile mechanical equipment for the cigarette, textile, watchmaking and domestic electrical equipment industries. Some have also made computers and other experimental equipment available to the civilian products departments.

Production of certain civilian-use textiles. Many enterprises have set up production lines for civilian products, using idle buildings and equipment, and have produced domestic-use electromechanical equipment for civilian aircraft and other civilian needs, as well as producing key parts and components. Some plants have produced graphite rings for the chemical fibers industry and have furnished urgently-needed parts for imported equipment, saving foreign exchange for the nation; some have used a variety of stainless steel screening which won a national award to produce high-quality filter components and have developed new products for the chemical fibers, chemical engineering, metallurgy and petroleum sectors.

ECONOMIC RESPONSIBILITY SYSTEMS IN ZHEJIANG INDUSTRIAL ENTERPRISES OUTLINED

Hangzhou ZHEJIANG RIBAO in Chinese 6, 7, 8 Sep 81

[Article: "What Types of Industrial Economic Responsibility Systems Has Our Province Instituted?"]

[6 Sep 81 p 2]

> [Text] Editor's note: Recently this newspaper has received many letters from readers asking about the economic responsibility systems instituted by industrial enterprises. Accordingly, a reporter from this paper visited relevant departments in this province and obtained some information about these matters, which is presented below.

[Question] What, in essence, is the situation since our province began to implement the economic responsibility system on the industry and communications front?

[Answer] Since the Third Plenary Session of the Eleventh Central Committee, this province's industrial and communications front has begun investigations related to implementation of the economic responsibility system. In 1979, when the Central Committee applied the financial contract system involving "separating receipts and disbursements and assigning responsibility at various levels," the provincial party committee made a study and drew conclusions, and the province and the cities and counties implemented the approach of "eating in separate kitchens." Next, many cities and counties also implemented the work contract system for industrial bureaus, companies and enterprises. At the same time, the system of partial retention of profits was implemented in enterprises participating in the experiment with expanded autonomy, in accordance with State Council and province guidelines. Thus the economic responsibility system is being expanded gradually in this province's industrial and communications enterprises. According to statistics from the end of 1980, various types of economic responsibility systems have already been implemented in 771 industrial and communications enterprises owned by the whole people; most of these have also introduced various types of work contracts for shops, shifts and even individual workers.

Establishing the economic responsibility systems and making them work properly, and linking economic responsibility and economic powers closely to economic interests helps solve the industrial and communications enterprises' long-standing problems of stifling centralization, "eating from one big pot," and tendencies toward egalitarianism, and are an important policy for improving economic performance and increasing financial revenues. Because the proportion of profit retained by the enterprise and the size of employee income is directly linked to the quality of production management and the magnitude of labor results, this strengthens the enterprises' internal economic incentive and creates the conditions for reorganizing enterprises, improving administration and management, and further stimulating the enterprises' and employees' enthusiasm.

The key problem in implementation of economic responsibility systems in the industrial and communications enterprises is that of correctly handling the relationship between the state, the enterprise and the employees. This manifests itself in two areas: the first is correct handling of the economic relationship between the enterprise and the state, and the second is correct handling of the distribution relationship within the enterprise.

[Question] What types of economic responsibility systems applying to the relationship between the enterprise and the state are in effect in this province? What are their merits and shortcomings?

[Answer] Currently six types of economic responsibility system applying to the relationship between the enterprise and the state are being used throughout this province.
